Stress orientations are shown in degrees and are selected by using the left and middle **mouse buttons** with the orientation control **sliders**. The labels of the first axis selected will turn **red**. The **direction** and **plunge** of the **first-selected axis** may be entered. Only **direction** changes are allowed for the **other two axes**. Pressing the reset button will **reset** the orientations and allow selection of a new first-selected axis. Directions range from 0 to 360 and plunges range from 0 to 90 in order to enable any measured or simulated 3D stress orientation.

Reset orientation by selecting the reset button.

Other axes labels are black.
Only direction may be modified.

"First-selected" axis labels are red. Direction and plunge may be modified.

Magnitude Tool Continued

Fluid pressure and tensile strength may be used when computing leakage factor (see **options**). Values are changed by using the left and right mouse buttons.

Stress magnitudes and orientations may be saved by pressing the save button and specifying a file name. These values may then later be reapplied by using the load button and choosing a file.

Stress Ratio Graph

Use the **stress ratio graph** window to select the desired stress magnitude ratios by holding down the **left mouse button** and moving the cursor to the desired stress state and releasing the mouse button. The **right mouse button** toggles between a logarithm base 10 (log-log) and natural logarithm (ln-ln) scale.

Stress Ratio Graph Continued

The stress ratio graph displays a **yellow square** whose location is based on the stress ratios of σ_1 to σ_2 along the y-axis and σ_2 to σ_3 along the x-axis of the plot. σ_1 is the magnitude of the maximum principal stress, σ_2 is the intermediate principal stress, and σ_3 is the minimum principal stress. In addition to showing the location of the current stress state on a logarithmic scale, the graph also shows where the current stress state lies relative to plots of the following parameters:

$$K = (\sigma_1 / \sigma_2) / (\sigma_2 / \sigma_3)$$

$$R = (\sigma_1 - \sigma_2) / (\sigma_1 - \sigma_3)$$

$TsMax$ = maximum slip tendency of all fault orientations for a given stress state.

Natural logarithm scale

Mohr Graph

The Mohr Graph allows the user to apply stress and fluid pressure to a specified type of rock and visualize the result. The result of the stresses and fluid pressure on the rock is displayed in a traditional Mohr Graph.
