MEMORANDUM TO: Cathy Haney, Program Director
Policy and Rulemaking Program
Division of Regulatory Improvement Programs, NRR

FROM: Joseph L. Birmingham, Project Manager */RA/*
Policy and Rulemaking Program
Division of Regulatory Improvement Programs, NRR

SUBJECT: SUMMARY OF SEPTEMBER 11, 2003 MEETING WITH NUCLEAR
ENERGY INSTITUTE (NEI) AND MATERIALS RELIABILITY PROGRAM
ON BUTT WELD SAFETY ASSESSMENT

On September 11, 2003, Nuclear Regulatory Commission (NRC) staff met with representatives of the Nuclear Energy Institute, the Electrical Power Research Institute (EPRI) Materials Reliability Program (MRP) and industry in a public meeting at NRC headquarters in Rockville, Maryland. At this meeting, industry discussed the interim Butt Weld Safety Assessment (MRP-44, Part 1); related recent inspections and results; NRC's comments and MRP's responses on MRP-44, Part 1; contents and schedule of the Final Safety Assessment, and future planned activities. MRP-44, Part 1, was an interim report dated April 2001 and represented the status of industry's safety assessment of Alloy 82/182 pipe butt welds at that time. The meeting attendees are listed in Attachment 1. The information presented by the MRP at the meeting is in Attachment 2 (ADAMS Accession No. ML032720003).

After introductions, the MRP gave a review of the MRP-44, Part 1, assessment methodology, conclusions, and recommendations that reflected the information and understanding of the MRP in 2001. The MRP presented some specific information from MRP-44, Part 1, Appendices A and B on the safety assessment for Westinghouse and Combustion Engineering, and Babcock and Wilcox designed plants. That information showed that there was not an immediate safety concern for cracks in Alloy 82/182 butt welds. The MRP presented information from recent inspections in domestic and foreign reactors which showed that about 150 dissimilar metal butt welds in domestic reactors had been inspected since 2001 with no indications detected but that some indications had been found in foreign reactors.

The MRP discussed their responses to NRC comments on MRP-44, Part 1, provided to the MRP in a letter dated June 14, 2001. The ADAMS accession number for the NRC letter is ML011670041. Details of the MRP responses to the comments are contained in Attachment 2. In general, the MRP response indicated that, while there was a basis for continued safe operation, additional work was necessary to understand the potential for significant circumferential cracking. Other NRC comments addressed staff expectations for the final safety assessment, visual inspections for leaks, the ability of leakage detection systems to detect small volumes of leakage, plant-specific factors such as insulation, In-Service-Inspection capability, flaw evaluation and leak-before-break, critical flaw size, cracking phenomenon, weld residual stress evaluation, risk assessment, and boric acid corrosion. In general, the MRP indicated that the final safety assessment would need to address each of these issues. The staff discussed the details of the responses with the MRP.

C. Haney

- 2 -

The MRP stated that their schedule was to submit the final butt weld safety assessment to the NRC by the end of first quarter 2004. The MRP expects to have an interim technical exchange meeting with the NRC possibly in December 2003 or January 2004.

The planned future activities include recommending changes to the ASME Code depending on inspection results, to evaluate recommendations for fleet-wide implementation under the NEI Materials Initiative, and to continue to monitor inspection results.

The NRC stated that the meeting had been helpful in updating them on the status of industry efforts towards a final safety assessment and in providing information on the responses to the NRC comments on MRP-44, Part 1. The MRP then summarized the meeting presentation and, as there were no further questions, the meeting adjourned.
