**Re: Docket No. 040-08006; License No. SUB-986
Kerr-McGee Chemical L.L.C. (KMCLLC) Technical Center
Outdoor Final Status Survey Report**

Dear Dr. Spitzberg:

Attached are two copies of the above referenced report. This report documents work done on the grounds surrounding the Technical Center. Work was conducted in accordance with our approved decommissioning plan. A subsequent report for interior work will be submitted at a later date.

If you have any questions regarding this matter, please feel free to contact me at (405) 270-2665.

Sincerely yours,

Russell H. Jones
Project Manager

Technical Center Decommissioning Project

FINAL STATUS SURVEY REPORT

Outdoor Survey Units

1. PURPOSE

- 1.1. This Final Status Survey Report (FSSR) is being submitted by Kerr-McGee Chemical, LLC (KMCLLC) to the Nuclear Regulatory Commission (NRC) for the areas on the Kerr-McGee Technical Center site (KMTC) designated as Outdoor Survey Units (SU). These areas are shown on Figures 1-1 through 1-3 included in Appendix 1. This report discusses the initial characterization surveys which were performed to define the extent and magnitude of residual contamination present within the survey units. The characterization data generated during the initial surveys were utilized in designing the Final Status Survey (FSS) for these survey units. This FSS was performed in accordance with the Final Status Survey Plan (FSSP) and the KMTC Decommissioning Plan¹ (D Plan) to demonstrate that the established guidelines for unrestricted release have been met. The results of the outdoor FSS are presented in this FSSR as justification for release of these survey units from License SUB-986 for unrestricted use.

2. HISTORICAL BACKGROUND

- 2.1. The KMTC facility was established in 1963 to provide a dedicated research and development facility for conducting chemical and radiological analyses, doing small quantity bench and batch scale research and development studies on manufacturing processes and investigating new chemicals. The site was licensed under a source materials license, SUB-986, and a byproduct materials license, 35-12636-06. License SUB-986 authorized the receipt of small quantities of source material for research and development in designated laboratories within the KMTC facility and in immediately surrounding designated sample storage or sample preparation areas. Source materials could be in any form but were typically ores containing uranium and thorium from NRC or Agreement

¹ Decommissioning Plan for the Kerr-McGee Chemical LLC Technical Center License No. SUB-986, docket No. 040-08006, April 5, 2001.

State licensed facilities, or process stream materials from a NRC licensed natural uranium conversion facility. KMCLLC ceased radiological activities at KMTC in 1998 at which time decommissioning activities were initiated.

- 2.2. Decommissioning efforts concerning byproduct nuclear materials were completed in 1998 and KMCLLC applied to the NRC to terminate License 35-12636-06. After confirmation that the sealed byproduct material sources had been removed from KMTC and returned to their manufacturers sealed, with no leakage or contamination present, NRC terminated License 35-12636-06 by letter dated March 2, 1998.
- 2.3. Decommissioning efforts at KMTC involving characterization, decontamination and remediation were initiated in 1998. The goal of the decommissioning effort is to release the entire 160-acre site and facilities for unrestricted use.
- 2.4. Based upon a survey of historical information and analysis of the characterization data, an arrangement and classification of survey units was determined for KMTC and is reflected in the D Plan. Figures 1-1 through 1-3 in Appendix 1 depict the survey units. The classification (Class) of each survey unit is shown in Table 2.1 along with a description of the survey unit location and the characterization data that was used to determine the classification for each survey unit.
- 2.5. The characterization soil data includes all soil data not used for background measurements that were taken before August 21, 2002.² Characterization scan data consists of the scan data taken through August 22, 2002. Survey units which required remediation were rescanned in their entirety for the FSS. Characterization soil samples from areas which were not removed or disturbed during remediation efforts were used for the FSS.
- 2.6. The KMTC D Plan was submitted to NRC on April 5, 2001. The NRC approved the KMTC D Plan via license amendment No. 9 on June 5, 2003. The FSSP for the outdoor survey units was in accordance with the KMTC D Plan.

² Consequently, a more comprehensive characterization data set is presented in Table 2.1 than was included in the D Plan.

**Table 2.1
Soil Characterization Data^a**

Area Location	SSU	Sample Depth	Pts	Class	Total U(pCi/g)		Nat Th(pCi/g)		Ra-226(pCi/g)		NaI ^b Max (cpm)

^a Concentrations and data given in this table do not include the contribution from natural background. When subtraction of background produced negative numbers, the value was set to zero. Post-remediation data points are excluded.

^b Maximum net cpm using a shielded 3"x 0.5" NaI detector.

3. SCOPE OF DECOMMISSIONING ACTIVITIES

3.1. Description of the Survey Units

3.1.1. The SU's included the former Uranium Test Pits (UTPs), a water treatment system consisting of a sediment collection tank, a limestone pit and drain lines, some storage areas, drainage areas east of the main building, some material drainage areas and buffer zones. Additionally, within these survey units are outdoor areas bordering the buildings' laboratories and plants where source and byproduct materials had been in use historically, as well as drainage and surrounding areas. Maps of the outdoor survey units covered by this FSS are presented as Figures 1-1 through 1-3 in Appendix 1.

3.2. Remediation

3.2.1. KMTC decommissioning activities resulted in the removal of the source materials from the UTPs in preparation for the future expansion of Highway 74 by the Oklahoma Department of Transportation and the resulting disposal of these materials at a licensed LLRW disposal facility. All other outdoor areas were characterized and, where necessary, remediated to meet the unrestricted release criteria.

3.3. Data Collection

3.3.1. The FSS data in this FSSR was collected in accordance with MARSSIM³ and the KMTC D Plan. Wherever characterization data met the data quality objectives and the location of such data was not disturbed by remediation efforts, characterization data were used as FSS data.

3.4. Identification of Contaminants

3.4.1. The licensed source materials utilized at the KMTC site were natural uranium and natural thorium. Characterization and FSS have confirmed the presence of these radionuclides and associated decay products at the site.

3.5. Background Reference Levels

3.5.1. For comparison to guideline values, natural background levels for the contaminants of interest are presented in Tables 3.1 and 3.2. The soil background levels were determined by the analysis of 291 soil samples taken at 73 locations in the unaffected areas south of the main building. The asphalt background levels were determined by the analysis of asphalt samples taken from 10 locations at off-site unaffected areas.

³ NUREG-1575, *Multi-Agency Radiation Survey and Site Investigation Manual*

Table 3.1
Soil Background Reference Data

Isotope	Mean (pCi/g)	Sigma (pCi/g)	Location	Number of Survey Points
Total Uranium	1.8	0.9	Unaffected areas (southern half of the site)	291
Natural Thorium	2.3	0.3	Unaffected areas (southern half of the site)	291
Radium 226	0.6	0.1	Unaffected areas (southern half of the site)	291

Table 3.2
Asphalt Background Reference Data

Isotope	Mean (pCi/g)	Sigma (pCi/g)	Location	Number of Survey Points
Total Uranium	0.7	0.5	Unaffected areas (Off Site)	10
Natural Thorium	0.4	0.2	Unaffected areas (Off Site)	10
Radium 226	0.3	0.1	Unaffected areas (Off Site)	10

- 3.5.2. Asphalt at sample locations was ground into a soil-like consistency and tested as soil. When the survey grid included asphalt areas, the background data for soil and asphalt were included in a single background data set so that the Wilcoxon rank sum test could be applied to the survey unit.
- 3.5.3. The background for shielded gamma measurements and scans over the materials surveyed was measured in unaffected areas, and the results are presented in Table 3.3.

Table 3.3
Shielded NaI Background Reference Data

Matrix	Mean (cpm)	Location	Number of Survey Points
Grass	3330	Unaffected areas (southern half of the site)	291
Asphalt	2160	Unaffected areas	10
Concrete	2110	Unaffected areas	10
Brick	4860	Unaffected areas	10

3.6. Radiological Release Criteria

3.6.1. Release Criteria for Radionuclides in Soil

3.6.1.1. The release criteria for uranium, radium 226 and thorium contamination in soil and paved areas are equivalent to those levels corresponding to a net dose of 25 mrem per year for an individual member of the public⁴. Table 3.4 displays the Derived Concentration Guidelines (DCGLw) for the radionuclides of interest taken from the D Plan. A survey unit is released by determining the fractional contribution from each series and applying the unity rule per Appendix D of the D Plan.

Table 3.4
Soil and Paved Areas Release Criteria

Nuclide	Surface Soil DCGLw (pCi/g)	Subsurface Soil^a DCGLw (pCi/g)
Natural Thorium	5.3	NA
Total Uranium (to Uranium 234)	228	165
Radium 226 (Th 230 series)	3.5	NA

^a The subsurface soil release limit applies to the Uranium Test pit. The DCGLw for the Test Pit is lower than the limit for surface soils due to ground water considerations. For other sub-surface areas which lie above the ground water, the surface soil limits were applied.

3.6.1.2. The criteria in Table 3.4 were compared with survey data net of background as described in Section 6 and Table 5.2 of the D Plan.

⁴ Average member of the critical population.

3.6.1.3. Localized regions of elevated radioactivity were evaluated against the DCGL for Elevated Material Concentrations (DCGL_{EMC}), which is a function of area.⁵ The area factor for Uranium presented in Appendix C of the D Plan was used for computation of DCGL_{EMC} values. This curve was reduced to the following equation using the curve-fit algorithm provided with MS Excel[®].

$$a\ priori\ DCGL_{EMC} = 11.76 * (\text{Largest Circular Area})^{-0.4223} * DCGL_w$$

3.6.1.4. An “a priori DCGL_{EMC}” was calculated based upon the largest circular unsampled area that could be described between the grid locations in each survey unit. This value represents the lowest activity in the soil which could exceed the EMC criterion⁶ in between the grid soil samples. The a priori DCGL_{EMC} was compared with the scanning instruments’ capability (see Section 3.7.) to make sure that any unsampled concentrations which might exceed the EMC criteria could be detected by scans.⁷

3.6.1.5. Table 3.5 provides the a priori DCGL_{EMC} for each survey unit. The values in Table 3.5 are listed as a multiple of the sum of the fractions of the individual release limits.

⁵ KMTC D Plan, Appendix C.

⁶ Any smaller elevated areas between the grid points would have a higher EMC limit.

⁷ Reduction of the grid spacing will raise the a priori DCGL_{EMC} as required to match the detector’s capability.

Table 3.5
***a priori* DCGL_{EMC} Value**

Soil Survey Unit	Largest Circular Area (m ²)	<i>a priori</i> DCGL _{EMC} ^a (pCi/g)	<i>a priori</i> EMC Scan Threshold ^b (cpm)
1	6.1	5.5	16,170
2	82.8	1.8	5,292
3	73.8	1.9	5,586
4	252.0	1.1	3,234
5	80.9	1.8	5,292
6	59.6	2.1	6,174
7	68.9	2.0	5,880
8	60.9	2.1	6,174
9	59.2	2.1	6,174
10	103.4	1.7	4,998
11	65.5	2.0	5,880
12	77.6	1.9	5,886
13	78.6	1.9	5,886
14	82.1	1.8	5,292
15	345.7	1.0	2,940
16	41.1	2.4	7,056
17	81.2	1.8	5,292
18	80.0	1.8	5,292
19	76.7	1.9	5,886
20	80.2	1.8	5,292
21	83.5	1.8	5,292
22	82.4	1.8	5,292
23	67.6	2.0	5,880
24	175.0	1.3	3,822

^a With application of the unity rule DCGL_w becomes 1, so the values in this column are the same as the area factors.

^b Derived by multiplying the DCGL_w for Radium 226 by the area factor and the conversion factor given in Appendix 5.

3.6.2. Action Thresholds for Shielded NaI Scans

3.6.2.1. Shielded NaI scans were performed using the action thresholds presented in Table 3.6. Areas exceeding the thresholds were sampled for further analysis.

Table 3.6
Action Threshold for Shielded 3" x 0.5" NaI Scans⁸

SU Class	Action Threshold (cpm above mean background)
1	2,500
2	2,500

3.6.3. Release Criterion for Groundwater

3.6.3.1. The release limit for groundwater is 226 pCi/L total uranium.

3.6.4. Release Criteria for Fixed Equipment.

3.6.4.1. The release criteria for building surfaces were applied to affected fixed equipment that was not expected to be removed. Some examples include drains and buried piping. These items were surveyed for release using beta instruments wherever possible. Where a direct beta measurement was not possible, shielded NaI detectors were used to provide a qualitative estimate of radioactivity.

3.6.4.2. Table 3.7 displays the release limits (DCGLw) for the radionuclides of interest⁹ on building surfaces and fixed equipment. For simplicity, the most restrictive Th-232 limit was used for final status surveys.

⁸ NEXTEP Tech Memo 0209, *Technical Support Document for KMTC Final Status Surveys*, A.H. Thatcher, CHP. (Appendix 5)

⁹ NRC License Number SUB-986, Amendment No. 9 dated June 5, 2003.

Table 3.7
Building Surface and Fixed Equipment Release Criteria

Nuclide	DCGL _w (dpm/100 cm ²) ^a
Thorium-232 and progeny	12,500
Uranium series through U-234	177,300
Radium-226 and progeny	16,300

^a The release limit in dpm/100 cm² is based upon total beta emissions and is equivalent to βpm/100cm² used elsewhere in this report.

3.7. Minimum Detectable Concentration (MDC) Requirements.¹⁰

- 3.7.1. The MDC for laboratory soil spectroscopy should be less than 50% of the release limit. Table 3.8 demonstrates compliance with this requirement.
- 3.7.2. The Minimum Detectable Count Rate (MDCR) for NaI gamma scans for a class 1 survey unit can be no greater than the a priori DCGL_w converted to counts per minute for a shielded NaI detector. Table 3.9 demonstrates compliance with this requirement.
- 3.7.3. The MDCR for NaI gamma scans for a Class 2 SU should be no greater than the DCGL_w. Table 3.9 demonstrates compliance with this requirement.
- 3.7.4. The MDC for beta measurements and scans on fixed equipment is compared with the corresponding MDC requirements in Table 3.10.
- 3.7.5. Typical MDC and MDCR values for instruments used in the KMTC FSS meet all the requirements as shown in Table 3.8 through 3.10.
- 3.7.6. Characterization Samples that were not remediated were included as FSS data. Characterization samples that were collected on the surface at grid locations were changed from measurement type CH (characterization) to RG (regular grid) as required to complete the grid. All FSS data not located on the grid is considered bias data although it may appear with codes CH, BI (bias), or PR (post remediation).

¹⁰ See NEXTEP Tech Memo 0209, *Technical Support Document for KMTC Final Status Surveys*, A.H. Thatcher, CHP. (Appendix 5) for derivations.

Table 3.8
MDC for Soil Counts Gamma Spectroscopy

	Natural Thorium (pCi/g)	Total Uranium (pCi/g)	Radium 226 (pCi/g)	Count Time (min.)
Required MDC	2.7	114^a	1.7	
KMTC Soil Counter (typ)	0.1	0.8	0.1	2

^a 82 for the Uranium Test Pit (SU 1)

Table 3.9
MDCR for Outdoor Shielded 3" X 0.5" NaI Gamma Scans¹¹

	Class 1 (cpm)^b	Class 2 (cpm)^b
Required MDCR¹²	5,300 – 16,200^a	2,940
Shielded 3" X 0.5" NaI ⁷	1,200	1,200

^a The required MDCR for Class 1 SU's is the required MDCR for Class 2 SU's modified by the area factor and listed in Table 3.5.

^b The required MDCR relates to the counts per minute attributable to Ra-226 at the DCGL_w, net of background. Ra-226 is used since it has the most restrictive count conversion rate.

Table 3.10
MDC for Fixed Equipment¹³

	MDC for Beta Direct^a		MDC for Beta Scans^a
	Activity (βpm /100 cm ²)	Count Time (min.)	(βpm/100cm²)
Required MDC	6,250		12,500
L2224/43-89 ^b	740	1	4,350

^a The MDC relates to the counts attributed to Th-232 and progeny expressed in total beta per minute over 100 cm².

^b Also applies to 2360/43-89.

¹¹ KMTC D Plan, Appendix E contains the MDCR calculation for a shielded NaI detector.

¹³ NEXTEP Tech Memo 0209 (Appendix 5), *ibid*.

4. FINAL STATUS SURVEY METHODS

4.1. The purpose of this section is to discuss the methods used to collect the survey data presented in this report. The FSS data were used to show that all requirements of the D Plan were met. Any characterization data taken which met quality requirements for FSS have been included as FSS data. All characterization data points that have not been removed met the quality requirements for FSS and are included in this report.

4.2. Procedures

4.2.1. Procedures: The FSS conformed to the following procedures:

- KM-CI-RP-31: Personnel Monitoring and Decontamination
- KM-CI-RP-33: Decontamination of Tools, Equipment, Materials and Surfaces
- KM-CI-RP-39: Performance of Radiation and Contamination Surveys
- KM-CI-RP-40: Survey Documentation and Review
- KM-CI-RP-62: Cimarron Soil Counter Operation
- KM-CI-RP-49: NaI 3" Detector
- KM-CI-RP-52: Ludlum 2224 Alpha-Beta Detector
- KM-CI-RP-57: Ludlum 2220/2221 43-68 Beta Probe

4.3. Instrumentation

4.3.1. Survey and soil sampling data were collected using the instrumentation listed in Table 4.1.

4.3.2. 3" x 0.5" NaI Gamma Detector - The 3" x 0.5" detector uses a sodium iodide (NaI) crystal gamma detector. The NaI detector was paired with a portable scaler/ratemeter with single channel analyzer capability. This detector was used in two configurations; shielded and unshielded.

4.3.2.1. Shielded: The NaI detector was shielded with lead around the top socket and sides to improve the directional sensing capabilities of the equipment. All characterization and investigative scans were performed with a shielded NaI detector.

4.3.2.2. Unshielded: The NaI detector was used without the lead around the top socket and sides. The detector was used in this configuration only during post remediation scans. In the unshielded configuration, the detector was used to locate local maxima above 1.5 times ambient background. The maxima were then rescanned with a shielded 3" x 0.5" NaI detector.

4.3.3. Micro-R Meter - The Micro-R meter was used as a qualitative measure of the exposure rate in an area. This instrument was not used to determine release status, since the DCGLw values incorporate ambient dose rate.

4.3.4. Soil Counters (Gamma Spectroscopy) - Soil Counter #2 was the soil counter used for Cimarron decommissioning with modified software to meet the specific conditions at KMTC. It was used for early sample counts and was replaced by Soil Counter #3 (a deep well detector which utilized the same software as Soil Counter #2). Soil Counter #3 was fully operational by late 2001.

4.3.4.1. Cimarron Soil Counter #2 consisted of a 4" x 4" x 16" sodium iodide crystal housed in a shielded chamber which was computer linked to a multi-channel analyzer (MCA). The counting system determined concentrations of Total U, Total Th, and Ra-226. Soil Counter #2 was programmed to determine the total uranium present in the soil sample by calculating the U-234 activity based upon the U-235 activity measured in the soil sample. The U-234 and U-235 activities were summed with the detected U-238 activity to obtain the total uranium activity.

4.3.4.2. Soil Counter #3 consists of a 7.5" x 7" sodium iodide crystal well detector housed in a shielded chamber and computer linked to a multi-channel analyzer (MCA). Soil Counter #3 was setup, maintained and operated at the Technical Center during the period of Final Status Survey.

Table 4.1

^a or equivalent

4.3.5. Ludlum 43-89 Alpha/ Beta Detector

4.3.5.1. The L43-89 is a scintillation detector with capability to detect alpha or beta emissions. The L43-89 was used in the beta configuration, window open, on fixed equipment surfaces surveyed for release. It was used in both alpha and beta configurations for transportation vehicle and container surveys.

4.3.5.2. The L43-89 was paired with either the L2224 or L2360 ratemeter, each containing a single channel analyzer, energy discriminator, and digital, analog and audio outputs. The combined instruments were used to perform direct (integrated) measurements and scan surveys.

4.3.6. Tennelec LB-5100

4.3.6.1. The LB-5100 is a computer-based, low background alpha/beta counting system used for laboratory counting of air, water (dried), and smear samples. Smears were used to characterize fixed equipment and containers used for waste transport.

4.3.7. Portable Instrument Maintenance, Calibration, and Quality Control

4.3.7.1. The instrumentation utilized to generate the FSS data was maintained in accordance with the Cimarron Radiation Protection Program procedures, which were approved by the NRC. These procedures utilized the guidance contained in ANSI N323-1978, "Radiation Protection Instrumentation Test and Calibration". As specified by the Cimarron procedures for instrumentation, requirements included traceability of calibrations to NIST standards, field checks for operability, background radioactivity checks, operation of instruments within established environmental bounds, training of individuals, scheduled performance checks, calibration using isotopes of energies similar to those to be measured, quality assurance tests, data review, and record-keeping.

4.3.7.2. Portable survey instruments were calibrated on at least a semi-annual basis. Where applicable, activities of sources utilized for on-site calibration were corrected for decay. In addition to the periodic calibration requirements, source response checks were performed on a daily basis for all instruments being utilized during FSS work.

4.3.7.3. All calibration and source check records were completed, reviewed, signed-off and retained in accordance with the Cimarron Quality Assurance Program.

4.3.7.4. Established quality assurance measures for the soil counter included Cesium-137 centroid checks, Chi-square tests, background determinations, and the counting of soil standards. All of these quality assurance controls were recorded on control charts and were trended on a continuing basis.

4.3.8. Confirmation, Verification, Calibration and Quality Control for the Soil Counters

4.3.8.1. Standards used for calibration and quality assurance checks for the soil counter were analyzed by outside laboratories and are NIST traceable through these analyses. Comparisons were made between the standards as counted using the soil counter and two off-site laboratories. The

assigned values for the standards were the average of the results obtained from the off-site laboratories, when the standards were analyzed by more than one laboratory.

- 4.3.8.2. Total uranium, natural thorium, and Ra-226 activities in soil were determined based upon the evaluation of net counts from the soil counter. Activities were calculated through the use of efficiency and correction factors obtained using appropriate standards. Soil concentrations were calculated by dividing the net activity by the soil mass. Soil masses were determined on a laboratory scale which was checked on a daily basis (when in use) utilizing NIST traceable standards.
- 4.3.8.3. ORISE has been used by the NRC from time to time for verification of the soil counters at Cimarron and KMTC. Confirmation Surveys were taken and the results were reported as shown in Table 4.2. No significant discrepancies to date have been recorded between soil counters #2 and #3 and ORISE.

Table 4.2
Confirmation and Verification of Soil Counters

Counter #	Survey Date	Area Covered	NRC Inspection #	Results
#2	5/27/97	Cimarron Site	70 - 925/97 - 02	Agreement
#2 ¹⁴	7/9/99	Various Sites	70 - 925/99 - 01	Agreement
#3	5/9/01	UTP	40-8006/01-01	Agreement
#3	9/16/02	Neutralization Pit Sludge	40-8006/02-01	Agreement
#3	11/25/02	Remediated SU's other than SU-1	40-8006/02-02	Agreement

4.4. Use of Characterization Data

- 4.4.1. Characterization data in the form of scan data and soil samples were taken throughout all of the affected areas on the site. The characterization survey revealed areas of elevated radioactivity in several of the survey units. Where remediation was necessary, the elevated radioactive material was removed, the soil was re-sampled, and the entire survey unit was rescanned to ensure that the area met MARSSIM requirements. After remediation was completed, NRC confirmation surveys were requested and performed prior to backfill of excavated areas.

¹⁴ 130 Samples from other KMC sites were analyzed on counter #3 and submitted to NRC for confirmation as part of this report.

- 4.4.2. Characterization samples that were not remediated were included as FSS data. When they fell in the grid locations, the measurement type¹⁵ was changed from CH to RG. All other characterization data that remains is considered bias data although it may appear with codes indicating CH or BI.

4.5. Soil Samples

4.5.1. Systematic Sampling

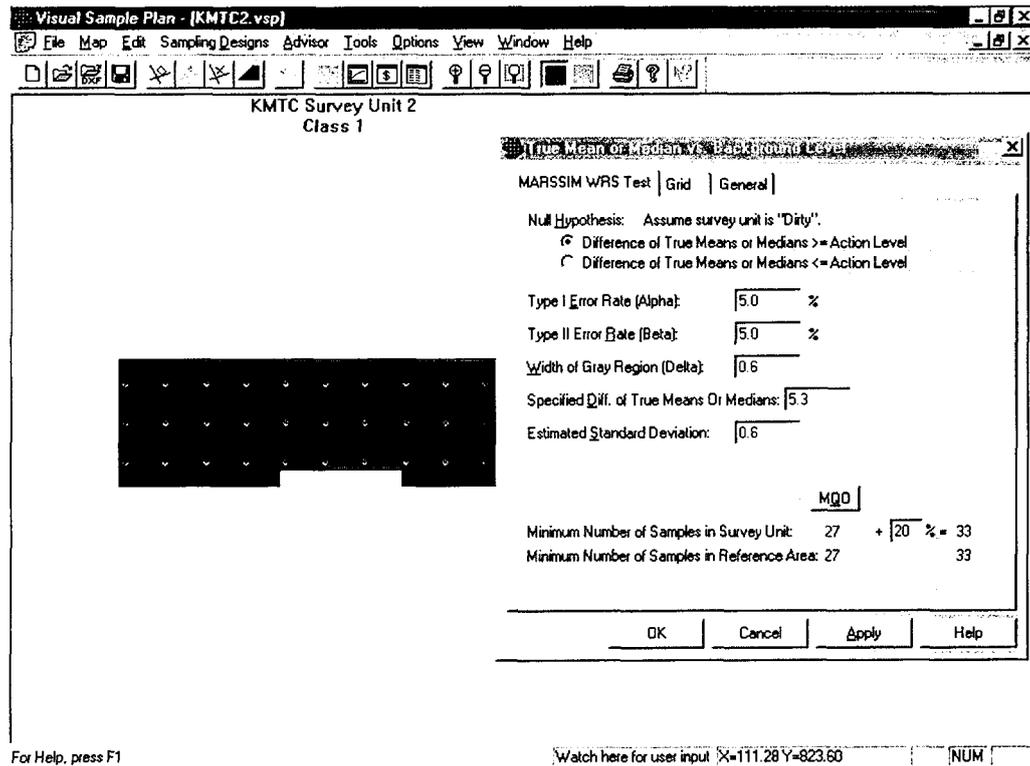

- 4.5.1.1. A systematic grid pattern of soil samples was collected in each survey unit. Grid samples were composites from the surface to a depth of 15 cm. The minimum number of points required and their spacing were calculated in accordance with the statistical guidance given in MARSSIM Sections 5.5.2.2 and 5.5.2.5. Samples taken at depths lower than 15 cm were defined to be bias samples.
- 4.5.1.2. Figure 4-1 depicts the screen input and output of Visual Sample Plan[®] (VSP)¹⁶, a program used to develop the grids for MARSSIM surveys which has been verified by NEXTEP in connection with other projects¹⁷. VSP contains the DQO input values and assumptions necessary to calculate the number of measurement points, N, required to satisfy MARSSIM statistical guidance. The calculations include 20% excess to allow for inaccessible locations. SU-2 is used here as an example because all survey units except SU-1 had the same input and output values in this program. A summary of all the input parameters used with VSP for this Plan is presented in Table 4.3¹⁸.

¹⁵ See Table 4.6 for measurement type codes.

¹⁶ VSP is a software package that supports the implementation of a DQO process and the development of a technically defensible sampling scheme. The software is developed by Pacific Northwest National Laboratory and sponsored by DOE and EPA.

¹⁷ NEXTEP Tech Memo 0008, *Verification and Validation of Applicable Portions of VSP Software*, A.H. Thatcher, CHP.

¹⁸ Although some characterization data is available and generally serves as the basis for the lower bound for the gray region (LBGR), the actual LBGR and standard deviation for the SU are biased in order to calculate a relative shift of 1 and conservatively estimate the number of required measurement points.

Example of Visual Sample Plan Data Entry and Output

Figure 4-1

Table 4.3
VSP Input

Parameter	SU-1	SU 2-24
Type I Error Rate (%)	5	5
Type II Error Rate (%)	5	5
Width of Gray Region (pCi/g)	2.7	0.6
Specified Differential of True Means (>= Action Level) (pCi/g)	165	5.3
Estimated Standard Deviation (pCi/g)	1.8	0.6
Excess Sample Points Over Minimum (%)	20	20

- 4.5.1.3. A rectangular grid was used for all survey units except SU-1, which had a triangular grid. For SU's 2 through 24, the grid interval spacing, L, was calculated from the area of the total survey unit and the required number of data points, N, according to the following equation:

$$L \leq \sqrt{\frac{A}{N}}$$

For SU-1, the grid interval spacing was calculated using the following equation:

$$L \leq \sqrt{\frac{A}{0.866 \cdot N}}$$

Table 4.4 presents the calculated values for L and N for each survey unit.

- 4.5.1.4. In practice the number of grid points included within a survey unit will vary due to geometric considerations, the random origin requirement specified by MARSSIM, and the existence of obstacles such as trees which preclude taking a sample. This variation is acceptable provided at least the minimum number of grid points is achieved (ie. $0.80 \cdot N$).

Table 4.4
Calculated Grid Point Separation

Survey Unit	Class	N, # Pts to be taken	A, Survey Unit Area (m ²)	L, Grid Spacing (m)
1	1	18	69	2.2
2	1	33	1,851	7.5
3	1	33	1,680	7.1
4	2	33	10,514	17.7
5	1	33	1,800	7.4
6	1	33	1,405	6.5
7	1	33	1,500	6.7
8	1	33	1,324	6.3
9	1	33	1,038	5.6
10	2	33	2,300	8.4
11	1	33	1,415	6.6
12	1	33	1,710	7.2
13	1	33	1,750	7.3
14	1	33	1,750	7.3
15	2	33	7,512	15.1
16	1	33	975	5.4
17	1	33	1,850	7.5
18	1	33	1,700	7.2
19	1	33	1,700	7.2
20	1	33	1,700	7.2
21	1	33	1,800	7.4
22	1	33	1,800	7.4
23	1	33	1,800	7.4
24	2	33	5,450	12.9

4.5.2. Elevated Material Concentration (EMC) Considerations

4.5.2.1. The grid spacing provided by VSP was reviewed as described in Section 3.6.1 to ensure that small areas of elevated radioactivity existing between the grid survey points which exceed the limits for EMC could be detected by scans using typical instruments and MDC's.

4.5.2.2. The KMTC D Plan¹⁹ provides the supporting analysis to show how the spacing of the grid measurements and the Scan MDCR can adequately identify locations that exceed the DCGLw.

¹⁹ KMTC D Plan Section 6.4.7.

4.5.3. Bias Sampling

4.5.3.1. In addition to the statistical surface samples, bias samples were taken at various locations and depths. Such samples were chosen based upon the likelihood of contamination (i.e., areas where radioactivity would be likely to accumulate due to surface topography or other factors), statistical methods, the judgment of the site RSO or senior HP technician, and according to best practices. Bias samples were also collected to examine and characterize areas with elevated levels of radioactivity in accordance with the Hot Spot Protocol presented in Appendix 6. When bias samples were taken below the surface they were usually taken as composite samples from 15 cm to 50 cm, and 50 cm to 1 m in depth from the local surface.

4.5.4. Asphalt Sample Locations

4.5.4.1. Asphalt paved surfaces were surveyed by taking composite samples from the top six inches of asphalt. The soil samples beneath the asphalt were classified as Bias (BI). Regular Grid (RG) points that fell on concrete areas were sometimes offset to the nearest soil or asphalt locations.

4.5.5. Sample Results

4.5.5.1. Figures 4-1 through 4-3 in Appendix 1, show soil sample results obtained during the Characterization phase. Appendix 1, Figures 5-2 and subsequent show the soil sample results after remediation and FSS were complete.

4.6. Scans

4.6.1. Each area to be scanned was divided into 100m² blocks which were scanned with a shielded 3" x 0.5" NaI detector. Shielded scan surveys were performed on 100% of all outdoor surfaces (ground surface, asphalt and concrete areas) for class 1 survey units and at least 10% of all outdoor surfaces for class 2 survey units. Characterization scan data was used for FSS in survey units where no remediation was required.

4.6.2. Scan surveys were performed utilizing both visual instrument readout and audible rate changes to provide indication of elevated areas. The action threshold for shielded NaI scan surveys is presented in Table 3.6. The results of the characterization (pre-remediation) scans are presented in Appendix 1, Figure 4-4.

4.6.3. When contaminated soils were excavated, shielded NaI scans were continuously performed to guide the excavation and, when the excavation was complete, soil samples were taken at the maximum scan value in each excavation for confirmation.

- 4.6.4. As an additional quality control measure, survey units which had been remediated and back-filled were scanned in their entirety with the unshielded NaI detector. Any areas that exceeded 1.5 times background were scanned again with the shielded detector using the thresholds in Table 3.6. If no unshielded readings were obtained above 1.5 times background, the area with the highest unshielded readings was re-scanned with the shielded detector for final confirmation.

4.7. Buried Piping and Other Affected Fixed Equipment

- 4.7.1. Bias survey measurements were obtained on all affected buried piping and other fixed equipment in specific survey units. To the extent practical, internal access points for pipes were surveyed by direct β measurement, or NaI scan to determine the potential for internal radioactivity. Sludge and removable materials at access points were collected and sent to the HP lab for analysis. Where removable contamination was measured in excess of 200 dpm/100cm² ²⁰, additional characterization data was collected or the surfaces were remediated.

- 4.7.1.1. The radioactivity on the interior surfaces of affected pipes or drain lines were determined by making measurements at access points, provided that contamination at these locations was likely to be representative of contamination on the interior.

- 4.7.1.2. Discharge piping was considered contaminated if:

- i.) Direct β measurements on accessible internal surfaces exceeded the DCGLw,
- ii.) Sludge taken from traps or access points and analyzed at the HP lab exceeded the DCGLw for soil,
- iii.) Removable contamination measured more than 200 β pm/100cm² above background, or
- iv.) Gamma scans/measurements on external surfaces exceeded 2x background.

4.8. Measurements Exceeding Limits

- 4.8.1. In the event that scan measurements exceeded the Table 3.6 Action Threshold, or if soil sample results were determined to have activity exceeding the release limits, the procedures described in the D Plan and the Hot Spot Evaluation Protocol (Appendix 6), were carried out.

4.9. Data Collection and Evaluation

- 4.9.1. All FSS data recorded in the field was submitted to the Quality Assurance Coordinator (QAC) for processing and review. The data collection forms and annotated drawings were signed by the technician collecting the data and reviewed

²⁰ FC-8323 limit for the Thorium series. In this case dpm refers to β emissions (see note, Table 3.7).

by the HP supervisor overseeing the survey. After data entry and review, the QAC approved the data sheets and filed them with the permanent KMTC records. The approved forms are listed in Table 4.5 below.

Table 4.5
Approved Data Collection Forms

Form Number	Title	Purpose
QATC-017	FSS Data Collection Sheet	Collection of Soil Samples
QATC-018	FSS Outdoor Scan Measurement Survey Form	Recording data from Scans and investigation of hot spots
QATC-019	Remediation and Supplemental Data Request	Request and authorize remediation and/or supplemental data collection

- 4.9.2. Where post remediation or supplemental data were required, the analyst reviewing the data generated a request form with instructions for remediation (where required) and for the collection of additional data. The soil samples taken were filled out on the request. Before work proceeded to perform the remediation or collect additional samples, the request form was signed by either the RSO (Cimarron) or the RSO (Technical Center) authorizing the work.
- 4.9.3. The QAC was responsible for initial screening of the incoming data to ensure that SOP and FSSP requirements had been fulfilled and that the data had been legibly and accurately recorded. This process was carried out by qualified staff personnel selected by the QAC and included the following:
- Evaluating the completeness of the forms and data tables
 - Verifying instrument calibration.
 - Verifying survey technician training qualifications
 - Making a judgment about the overall quality of the data. This was a check to identify gross errors in data recording
 - Determining if data were reported in the appropriate Standard Units.
 - Verifying that all the requested samples were obtained according to the FSSP.
- 4.9.4. The QAC was also responsible for the accurate transcription of the survey data from paper records into the project's database. Some of the checks required (such as calibration of equipment or training of the surveyor) were performed automatically within the database.
- 4.9.5. The QAC maintained the permanent archive files of all survey data taken in connection with the project and provided for its security, organization, and availability to authorized reviewers including the NRC.

- 4.9.6. Once the survey data set was complete, verified, transcribed and filed by the QAC, it was examined by an analyst and several tests were applied to the data as described in the D Plan²¹.

4.10. Reports

4.10.1. All the required tests were performed on each survey unit as a part of the Threshold Comparison Test Report (TCTR) generated by the KMTC Radiation Database. All required tests have been combined into this standard database report and the calculations have been verified²². The output of the TCTR was used for analysis of the data in each survey unit and the results are presented in Appendix 3, Tabs 1 through 24. The TCTR was run for each individual radionuclide and for FMPC on all survey units. All four versions of the TCTR (U, Th, Ra, and FMPC) are included for SU-1. For all other survey units only the version which failed the most tests was included²³. The TCTR is divided into sections as follows:

- General: date, survey unit number, class, and grid information.
- Survey Unit Table: survey unit coordinates and surface area of survey unit.
- Initialization Data: On startup of the analysis report program, the analyst must tell the program which parameters to use while running the tests described in this section. The *Initialization Data* section of the report output displays the options that were chosen for the run. The measurement types listed are those chosen by the analyst to be included in the report. Those types are described in Table 4.6 below. The date range chosen is also listed (the default value is "All"). The thresholds applicable to the specified nuclides are also listed. The thresholds were identified in the D Plan. The nuclides tested in the report are also listed. Usually, only the FMPC report will be included. When one of the individual nuclides fails a test other than background, the report for that nuclide is included as well.
- Survey Unit Test Status: Lists Pass/Fail status of all tests and gives a high level summary of key activity levels in the survey unit.
- Points that failed tests: Lists all points that failed each specified test.
- Points that passed Background, DCGLw, and EMC tests.

²¹ KMTC D Plan Section 6.3.

²² NEXTEP Tech Memo 0227, *Verification of KMTC Radiation Database, Soils Portion*, B. Anderson. (Appendix 2).

²³ Each TCTR contains all the results for every data point in the data set. The nuclide selected (or FMPC) only determines the parameter on which the sort and the tests are performed.

- Wilcoxon Rank Sum (WRS) Test Results: This page lists the results of the WRS Test on the survey unit. If the Test Status line reads Pass then the survey unit passes the WRS Test, and thus may be released if all other criteria have been met. The Data Summary section lists the number of background points used on the data set, and the number of points measured in the WRS Test. Also listed are the referential value (W_r) required by the WRS Test and the critical value (W_c) representing the survey unit. The WRS Test is passed when (W_r) exceeds (W_c). If (W_c) exceeds (W_r) then the survey unit fails the WRS Test, and the survey unit requires remediation prior to release.

Table 4.6
Measurement Types

Measurement Type	Description
RG	Regular Grid
BI	Bias
PR	Post Remediation Bias
PG	Post Remediation Grid
BK	Background
CH	Characterization
QC	Quality Control

- 4.10.2. An abbreviated description of the tests performed on the data is presented in Table 4.7. Details of the mathematical implementation of these tests are presented in Appendix 2.

Table 4.7
MARSSIM Statistical Tests for Soil Data

Test	Test Criteria for Pass
Min/Max	Difference between minimum background measurement and maximum survey value less than DCGL _w
Background	All samples must be less than the background threshold ^a
DCGL _w	All samples must be no more than DCGL _w + the background threshold ^a
DCGL _{avg}	The average of all net survey values must be less than DCGL _w
EMC	All samples must be less than DCGL _{EMC} + the background threshold ^a
WRS	The Wilcoxon Rank Sum Test is described in detail in Chapter 8 of MARSSIM

^a The background threshold (T_{bk}) is equal to the mean background value plus twice the standard deviation of the background data set (σ_{BK}). (See Appendix 2).

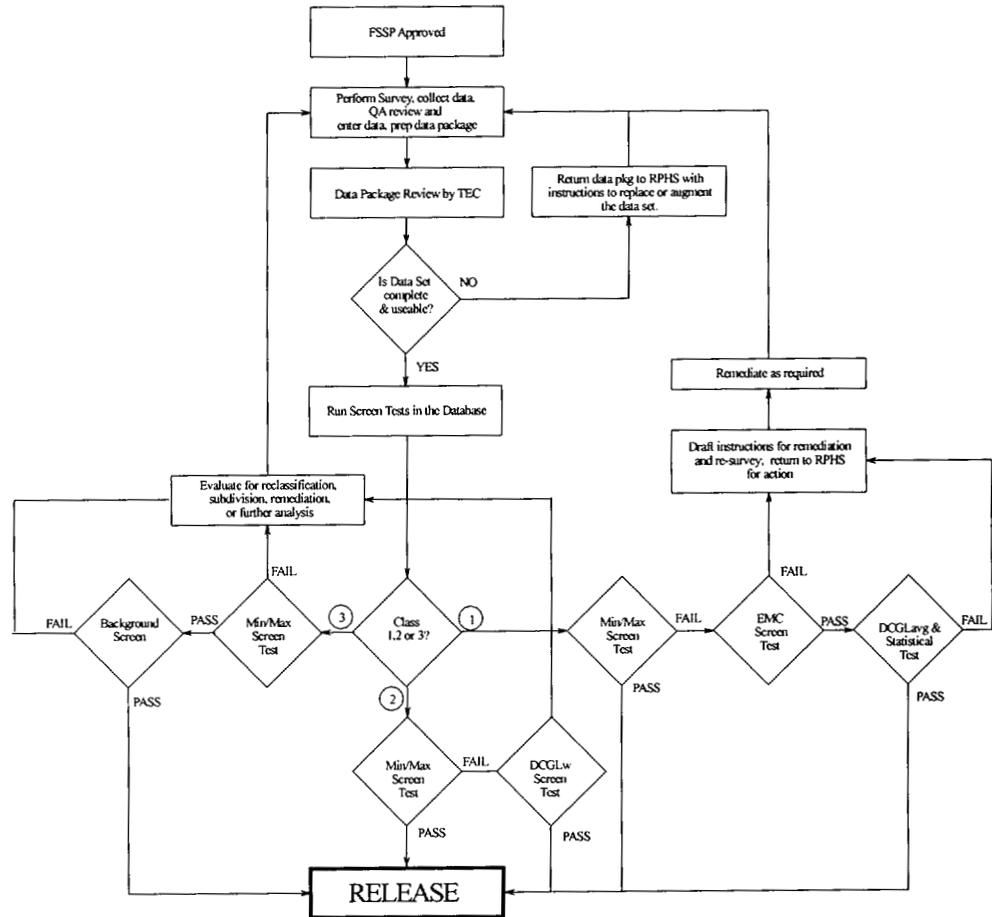

4.10.3. Provided all additional considerations such as scan data, sampling of removable contamination or sludge from traps, etc. indicate that the survey unit is clean, the release of the survey unit can be determined from the test report according to Table 4.8. If a survey unit is Class 2 and fails the min/max test, it must pass the DCGL_w test to be released from the license without reclassification to Class 1 or remediation.

Table 4.8
Requirements for Survey Unit Release

Test	Class 1	Class 2	Class 3
Min/Max	not required ^a	not required ^a	PASS
Background	not required	not required	PASS
DCGL _w	not required	PASS	PASS
DCGL _{avg}	PASS	PASS	PASS
EMC	PASS	PASS	PASS
WRS	PASS	PASS	PASS

^a Class 1 or 2 survey units which pass the Min/Max Test may be released without further consideration.

4.10.4. The flow diagram from the D Plan which depicts the decision tree for release of survey units is reproduced in Figure 4-5.

FSS Data Evaluation Process

Figure 4-5

5. RESULTS AND DISCUSSION

5.1. Survey Unit 1

5.1.1. SU-1 is a Class 1 survey unit. The survey unit is located in the northwest corner of the Kerr-McGee Technical Center site. The survey unit contains the area where the Uranium Test Pits (UTP) were located. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. This survey unit was excavated to enable extraction of the tin horns that were in the UTP.

5.1.2. SU-1 is located in the plane of the bottom of the excavation at a depth of approximately 12 feet from surface grade²⁴. This level corresponds to the bottom of the tin horns as they were installed. The area included in SU-1 is 69 m².

5.1.3. Remediation

5.1.3.1. The tin horns and the surrounding impacted soil were removed from this survey unit in 2000, and shipped off site for disposal. Post Remediation (PR) soil samples were taken from the bottom and sides of the excavation to ensure that no areas of elevated activity remained in the soil within the excavation both inside and outside of the boundaries of SU-1. A contour map of the UTP excavation is presented in Figure 5-1 of Appendix 1.

5.1.4. Groundwater

5.1.4.1. After removal of the tin horns, a groundwater survey was conducted within the UTP excavation area. Uranium levels in a seep area located at the western end of the excavation initially showed elevated levels of total uranium. General area composites, however, were below the release criteria.

5.1.4.2. The excavation initially generated an average of greater than 0.0007 gpm (1,000 gallons/day). This decreased to 0.00007 gpm (100 gallons/day) or less in August 2001.

5.1.4.3. Groundwater from the UTP excavation was analyzed for residual radioactivity both onsite and offsite. Onsite measurements using a Tennelec low-background alpha/beta proportional counter were used for qualitative field results while offsite measurements used alpha spectroscopy and/or KPA methods.

²⁴ All other survey units are located at ground level.

- 5.1.4.4. A graph showing total uranium versus time for the UTP groundwater plus a tabular listing of the independent laboratory²⁵ data are presented in Appendix 4.
- 5.1.4.5. Uranium concentrations in the seep located in the West end of the excavation continued to show a general decline until the excavation was closed.
- 5.1.4.6. Just prior to backfilling the excavation, independent laboratory analysis of three samples by General Engineering Laboratories and two samples by Severn Trent Labs (approximately 80 pCi/L total U) indicated concentrations well below the DCGL.
- 5.1.4.7. The removal of approximately 440,000 gallons of water from the UTP excavation area is believed to have effectively de-watered the area around the excavation and remediated the site, as evidenced by the reduction in both water removal volumes and total U concentration measurements. The combination of decreasing concentration and volume of water entering the excavation suggests that the remaining residual activity in the interstitial pore spaces of soils surrounding the UTP area has been substantially reduced and is below the DCGL.

5.1.5. Final Status Survey Data

- 5.1.5.1. **Soil Samples** - 66 soil samples were taken from the survey unit in the remediated excavation area. 21 of those samples were regular grid (RG) samples or post remediation grid (PG) samples that were collected at the bottom of the excavation (the base of the tin horns). Other locations were sampled on the pit sides and bottom. 9 locations were sampled to depth below the bottom surface of the pit. Of those, 2 locations were taken to bedrock at less than 1 meter depth and the other 7 locations were taken to a maximum depth of 1 meter from the local surface. All samples measured less than 1.0 FMPC. The data are summarized in Table 5.1.3 and mapped in Appendix 1, Figure 5-2.

²⁵ General Engineering Laboratories, STL and NRC

Table 5.1.3
FSS Soil Sample Data Summary^a

Measurement Type	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)
Grid	-0.1	21	3.0	15	-0.2	0.3	0.0	0.2
Bias	0.0	45	5.5	41.5	-0.5	0.1	0.1	0.5

^a Activity values are net of mean background. FMPC was calculated net of mean background plus 2 sigma as described in Appendix 2.

5.1.5.2. Some soil was also removed from SU-2 and SU-3 as part of the remediation of the tin horns and surrounding impacted soil. The data gathered from the parts of this excavation that are within SU-2 and SU-3 are not included in this section except that they are summarized in Table 5.1.4. All data from this excavation that is not included in this section is evaluated and addressed in section 5.1.2 or 5.1.3 of this report.

Table 5.1.4
FSS Soil Sample Data in Other Survey Units^a

Survey Unit	Measurement Type	# Points	Max FMPC	Uranium (pCi/g)		Natural Th (pCi/g)		Ra-226 (pCi/g)	
				Mean	Max	Mean	Max	Mean	Max
2	Bias	86	0.0	1.7	14.2	-0.4	0.3	0.1	0.8

^a Activity values are net of mean background. FMPC was calculated net of mean background plus 2 sigma as described in Appendix 2.

5.1.5.3. All tests required by the D Plan were performed for this survey unit and all required tests passed. A summary of test results is presented in Table 5.1.5. Each Threshold Comparison Test Report (TCTR) for this survey unit includes a tabular listing of all the soil samples used for the FSS. The results of each screening test and the Wilcoxon Rank Sum test are included in four TCTRs²⁶ presented in Tab 1 of Appendix 3. Analysis of the soil samples in SU-1 showed that the survey unit met the criteria for release.

5.1.5.4. On May 9, 2001, representatives of NRC Region IV collected confirmation samples from the UTP under NRC inspection number 40-8006/02-02. Analysis performed by ORISE was in agreement with the data produced on site (see Table 4.2 for other confirmatory surveys).

²⁶ All four versions of the TCTR are included for this survey unit as described in Section 4.10.

Table 5.1.5
Threshold Comparison Test Report Results for SU-1

Test Performed	FMPC	U	Th	Ra	Must Pass
Min/Max	P	P	P	P	
Background	P	F	P	F	
DCGL _w	P	P	P	P	
DCGL _{avg}	P	P	P	P	X
EMC	P	P	P	P	X
Wilcoxon Rank Sum	P	P	P	P	X

5.1.5.5. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

Table 5.1.6
UTP Area Scan Results^{a, b}

Matrix	Investigation Threshold^b	Maximum Scan^b	Average Scan
Remediated Pit	2,500 cpm	1,880 cpm	1,190 cpm
Grass	2,500 cpm	1,270 cpm	150 cpm

^a includes 100% of the backfilled area that was excavated during removal of the tin horns.

^b net of mean background.

5.1.6. Conclusions

5.1.6.1. All shielded NaI scans taken on the surface of SU-1 were below the investigation threshold.

5.1.6.2. After remediation, no soil samples from SU-1 exceeded the DCGL_w.

5.1.6.3. After remediation, no groundwater tested within SU-1 exceeded the DCGL for groundwater.

5.1.6.4. SU-1 passed all required screening tests.

5.1.6.5. SU-1 passed the statistical WRS test.

5.1.6.6. SU-1 meets all license criteria for release of a Class 1 survey unit.

5.1.7. Recommendations

5.1.7.1. SU-1 should be released from the license.

5.2. Survey Unit 2

5.2.1. SU-2 is a Class 1 survey unit. The survey unit is located in the northwest corner of the Kerr-McGee Technical Center site. The survey unit borders the north side of the area where the Uranium Test Pits (UTP) were located. Since the excavation discussed in Section 5.1 of this report extended into this survey unit, some data covered by this section is due to that excavation. The soil samples collected as a result of that excavation are summarized in Table 5.1.4. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. The area included in the survey unit is 1,851 m².

5.2.2. Remediation

5.2.2.1. Prior to excavation of the UTP, two elevated soil samples on the surface of SU-2 were remediated to avoid mixing with the debris from the UTP excavation. The locations of these samples are shown in Appendix 1, Figure 4-1. Removal of less than one cubic foot of soil was sufficient to eliminate the contamination in each case.

5.2.2.2. During the removal of the tin horns from SU-1, contaminated sand, ore, and soil were excavated from the UTP and disposed.

5.2.3. Final Status Survey Data

5.2.3.1. **Soil Samples** - 125 FSS soil samples were collected from this survey unit. 33 of those samples were part of the grid, and the other 92 were bias samples. All samples were less than 1.0 FMPC. The data are summarized in Table 5.2.1 and mapped in Appendix 1, Figure 5-3.

Table 5.2.1
FSS Data^{a,b}

Measurement Type	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)
Grid	-0.1	33	0.3	2.0	-0.7	-0.1	0.0	0.3
Bias	0.0	92	1.3	12.9	-0.4	0.4	0.1	0.8

^a FSS data includes characterization data

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.2.3.2. All tests required by the D Plan passed except the Background Test. All tests required for release of a Class 1 survey unit were passed as shown in 5.2.2. The Threshold Comparison Test Report (TCTR) lists all the FSS soil samples in the data set and is presented in Tab 2 of Appendix 3.

Table 5.2.2
Screen Data and Statistical Test Report

Test Performed	FMPC	Must Pass
Min/Max	Pass	
Background	Fail	
DCGLw	Pass	
DCGLavg	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.2.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.2.4. Conclusions

5.2.4.1. NaI scans taken on the surface of SU-2 after remediation revealed no elevated soil concentrations.

5.2.4.2. No FSS soil samples tested from SU-2 exceeded the DCGL_w.

5.2.4.3. SU-2 passed all screening tests except background.

5.2.4.4. SU-2 passed the statistical WRS test.

5.2.4.5. SU-2 meets all license criteria for release of a Class 1 survey unit.

5.2.5. Recommendations

5.2.5.1. SU-2 should be released from the license.

5.3. Survey Unit 3

5.3.1. SU-3 is a Class 1 survey unit. The survey unit is located in the northwest corner of the Kerr-McGee Technical Center Site. The survey unit represents the southern boundary of the Uranium Test Pit (SU-1). Since the excavation discussed in Section 5.1 of this report extended into this survey unit, some data covered by this section is due to that excavation. The soil samples collected as a result of that excavation are summarized in Table 5.1.4. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. The area included in the survey unit is 1,680 m².

5.3.2. Remediation

5.3.2.1. During the removal of the tin horns from SU-1, soil was excavated from this survey unit as part of the pit. The entire excavated area is presented in Appendix 1, Figure 5-3.

5.3.2.2. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.3.3. Final Status Survey Data

5.3.3.1. **Soil Samples** – 45 FSS soil samples were collected from this survey unit. 32 of those samples were part of the grid, and the other 13 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.3.1 and mapped in Appendix 1, Figure 5-3.

Table 5.3.1
FSS Data^{a,b}

Measurement Type	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226

DCGL _w	Pass	
DCGL _{avg}	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.3.4. Conclusions

- 5.3.4.1. All NaI scans taken on the surface of SU-3 revealed no elevated soil concentrations.
- 5.3.4.2. No FSS soil samples tested from SU-3 exceeded the DCGL_w.
- 5.3.4.3. SU-3 passed all screening tests except background.
- 5.3.4.4. SU-3 passed the statistical WRS test.
- 5.3.4.5. SU-3 meets all license criteria for release of a Class 1 survey unit.

5.3.5. Recommendations

- 5.3.5.1. SU-3 should be released from the license.

5.4. Survey Unit 4

5.4.1. SU-4 is a Class 2 survey unit. The survey unit is located in the northwest corner of the Kerr-McGee Technical Center Site. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. The survey unit borders SU-2, SU-3, SU-5, SU-6, SU-7, SU-8, part of the north border of the site and the south side of the TSSL building. The area included in the survey unit is 10,514 m².

5.4.2. Final Status Survey Data

5.4.2.1. **Soil Samples** – 59 FSS soil samples were collected from this survey unit. 35 of those samples were part of the grid, and the other 24 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.4.1 and mapped in Appendix 1, Figure 5-5.

Table 5.4.1
FSS Data^{a,b}

Measurement Type	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226

^a FSS data includes characterization data

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.4.2.2. All tests required by the D Plan were passed except the Background Test. All tests required for release of a Class 2 survey unit were passed as shown in 5.4.2. The TCTR lists all the FSS soil samples in the data set and is presented in Tab 4 of Appendix 3.

Table 5.4.2
Screen Data and Statistical Test Report

Test Performed	FMPC	Must Pass
Min/Max	Pass	
Background	Fail	
DCGLw	Pass	X
DCGLavg	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.4.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure

4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.4.3. Conclusions

5.4.3.1. NaI scans taken on the surface of SU-4 revealed no elevated soil concentrations.

5.4.3.2. No FSS soil samples tested from SU-4 exceeded the DCGL_w.

5.4.3.3. SU-4 passed all screening tests except background.

5.4.3.4. SU-4 passed the statistical WRS test.

5.4.3.5. SU-4 meets all license criteria for release of a Class 2 survey unit.

5.4.4. Recommendations

5.4.4.1. SU-4 should be released from the license.

5.5. Survey Unit 5

5.5.1. SU-5 is a Class 1 survey unit. The survey unit is located in the southwest side of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-6 to the east and by SU-4 on all other sides. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. The area included in the survey unit is 1,800 m².

5.5.2. Final Status Survey Data

5.5.2.1. **Soil Samples** - 63 FSS soil samples were collected from this survey unit. 33 of those samples were part of the grid, and the other 30 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.5.1 and mapped in Appendix 1, Figure 5-6.

Table 5.5.1
FSS Data^{a,b}

Measurement Type	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)

^a FSS data includes characterization data.

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.5.2.2. The outfall area at the end of the buried pipe running westward from the TSSL building is located in SU-5. 5 BI soil samples were collected at the location of the outfall and the area was scanned with NaI. All of the soil samples were below 1.0 FMPC and the scan results were less than 600 cpm. The soil data are presented in Table 5.5.2, and the location of the outfall is mapped in Appendix 1, Figure 5-6.

Table 5.5.2
Pipe Outfall Soil Results – SU5

5.5.2.4. **Scans** – A NaI scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure 4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.5.3. Conclusions

5.5.3.1. NaI scans taken on the surface of SU-5 revealed no elevated soil concentrations.

5.5.3.2. No FSS soil samples tested from SU-5 exceeded the DCGL_w.

5.5.3.3. No soil data associated with buried pipe exceeded the DCGL_w.

5.5.3.4. NaI scans taken on the buried pipe revealed no elevated soil or removable concentrations.

5.5.3.5. SU-5 passed all screening tests except background.

5.5.3.6. SU-5 passed the statistical WRS test.

5.5.3.7. SU-5 meets all license criteria for release of a Class 1 survey unit.

5.5.4. **Recommendations**

5.5.4.1. SU-5 should be released from the license.

5.6. Survey Unit 6

5.6.1. SU-6 is a Class 1 survey unit. The survey unit is located in the southwest side of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-5 to the west, the TSSL building to the south, and by SU-4 on all other sides. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. The area included in the survey unit is 1,405 m².

5.6.2. Remediation

5.6.2.1. Three areas were excavated north and northwest of the TSSL building to a maximum depth of 1.0 meter. The entire excavated area is presented in Appendix 1, Figure 5-7.

5.6.3. Final Status Survey Data

5.6.3.1. **Soil Samples** – 68 FSS samples were collected from this survey unit. 32 of those samples were part of the grid and the other 36 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.6.1 and mapped in Appendix 1, Figure 5-7.

Table 5.6.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226

5.6.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.6.4. **Conclusions**

5.6.4.1. NaI scans taken on the surface of SU-6 after remediation revealed no elevated soil concentrations.

5.6.4.2. No FSS soil samples tested from SU-6 exceeded the DCGL_w.

5.6.4.3. SU-6 passed all required screening tests.

5.6.4.4. SU-6 passed the statistical WRS test.

5.6.4.5. SU-6 meets all license criteria for release of a Class 1 survey unit.

5.6.5. **Recommendations**

5.6.5.1. SU-6 should be released from the license.

5.7. Survey Unit 7

5.7.1. SU-7 is a Class 1 survey unit. The survey unit is located at the north edge of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-10 to the east and by SU-4 on all other sides. Figure 1-1 in Appendix 1 shows the survey unit and its location at the site. The area included in the survey unit is 1,500 m².

5.7.2. Remediation

5.7.2.1. An area in the haul road was excavated to a maximum depth of 0.2 meters. The entire excavated area is presented in Appendix 1, Figure 5-8.

5.7.3. Final Status Survey Data

5.7.3.1. **Soil Samples** - 64 samples were collected from this survey unit. 39 of those samples were part of the grid and the other 25 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.7.1 and are mapped in Appendix 1, Figure 5-8.

Table 5.7.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226

5.7.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.7.4. Conclusions

5.7.4.1. NaI scans on the surface of SU-7 after remediation revealed no elevated soil concentrations.

5.7.4.2. No FSS soil samples tested from SU-7 exceeded the DCGL_w.

5.7.4.3. SU-7 passed all screening tests except background.

5.7.4.4. SU-7 passed the statistical WRS test.

5.7.4.5. SU-7 meets all license criteria for release of a Class 1 survey unit.

5.7.5. Recommendations

5.7.5.1. SU-7 should be released from the license.

5.8. Survey Unit 8

5.8.1. SU-8 is a Class 1 survey unit. The survey unit is located in the north side of the Kerr-McGee Technical Center Site. The survey unit borders the northwest corner of the main building and is bordered by SU-7 and SU-10 on the north, and by SU-9 on the east. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 1,324 m².

5.8.2. Final Status Survey Data

5.8.2.1. **Soil Samples** – 60 FSS soil samples were collected from this survey unit. 33 of those samples were part of the grid, and the other 27 were bias samples. All samples were less than 1.0 FMPC. The data are summarized in Table 5.8.1 and mapped in Appendix 1, Figure 5-9.

5.8.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure 4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.8.3. **Conclusions**

5.8.3.1. NaI scans taken on the surface of SU-8 revealed no elevated soil concentrations.

5.8.3.2. No FSS soil samples tested from SU-8 exceeded the DCGL_w.

5.8.3.3. SU-8 passed all screening tests.

5.8.3.4. SU-8 passed the statistical WRS test.

5.8.3.5. SU-8 meets all license criteria for release of a Class 1 survey unit.

5.8.4. **Recommendations**

5.8.4.1. SU-8 should be released from the license.

5.9. Survey Unit 9

5.9.1. SU-9 is a Class 1 survey unit. The survey unit is located in the north side of the Kerr-McGee Technical Center Site. The survey unit borders a portion of the north side of the main building and is bordered on the west by SU-8, on the north by SU-10 and SU-11, and on the east by SU-15. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 1,038 m².

5.9.2. Final Status Survey Data

5.9.2.1. **Soil Samples** – 59 FSS soil samples were collected from this survey unit. 33 of those samples were part of the grid, and the other 26 were bias samples. All samples were less than 1.0 FMPC. The data are summarized in Table 5.9.1 and mapped in Appendix 1, Figure 5-10.

Table 5.9.1

5.9.2.3. Scans – A scan of this survey unit was performed in October 2000 and August 2002 as part of the site characterization. 100% of the survey unit was scanned with a shielded NaI detector. No scans above the

investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.9.3. Conclusions

5.9.3.1. NaI scans taken on the surface of SU-9 revealed no elevated soil concentrations.

5.9.3.2. No FSS soil samples tested from SU-9 exceeded the DCGL_w.

5.9.3.3. SU-9 passed all screening tests.

5.9.3.4. SU-9 passed the statistical WRS test.

5.9.3.5. SU-9 meets all license criteria for release of a Class 1 survey unit.

5.9.4. Recommendations

5.9.4.1. SU-9 should be released from the license.

5.10. Survey Unit 10

5.10.1. SU-10 is a Class 2 survey unit. The survey unit is located in the north side of the Kerr-McGee Technical Center Site. The survey unit is bordered on the west by SU-7, on the east by SU-11, and on the south by SU-8 and SU-9. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 2,300 m².

5.10.2. Final Status Survey Data

5.10.2.1. **Soil Samples** – 41 FSS soil samples were taken in this survey unit. 33 of those samples were part of the grid, and the other 8 were bias samples. All samples were less than 1.0 FMPC. The data are summarized in Table 5.10.1 and mapped in Appendix 1, Figure 5-11.

Table 5.10.1
FSS Data^{a,b}

Measurement Type	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)
Grid	-0.2	33	0.7	2.1	-0.4	-0.1	0.1	0.3
Bias	-0.2	8	0.2	1	-0.4	-0.2	0.0	0.1

^a FSS data includes characterization data

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.10.2.2. All tests required by the D Plan were passed except the Background Test. All tests required for release of a Class 2 survey unit were passed as shown in Table 5.10.2. The TCTR lists all the FSS soil samples in the data set and is presented in Tab 10 of Appendix 3.

Table 5.10.2
Screen Data and Statistical Test Report

Test Performed	FMPC	Must Pass
Min/Max	Pass	
Background	Fail	
DCGLw	Pass	X
DCGLavg	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.10.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure

4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.10.3. Conclusions

5.10.3.1. NaI scans taken on the surface of SU-10 revealed no elevated soil concentrations.

5.10.3.2. No FSS soil samples tested from SU-10 exceeded the DCGL_w.

5.10.3.3. SU-10 passed all screening tests except background.

5.10.3.4. SU-10 passed the statistical WRS test.

5.10.3.5. SU-10 meets all license criteria for release of a Class 2 survey unit.

5.10.4. Recommendations

5.10.4.1. SU-10 should be released from the license.

5.11. Survey Unit 11

5.11.1. SU-11 is a Class 1 survey unit. The survey unit is located at the north edge of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-12 to the east, SU-10 to the west and by the Storage Building to the south. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 1,415 m².

5.11.2. Remediation

5.11.2.1. Two areas were excavated to the north of the Storage Building to a maximum depth of 0.25 meters. The entire excavated area is presented in Appendix 1, Figure 5-12.

5.11.3. Final Status Survey Data

5.11.3.1. **Soil Samples** - 76 samples were collected from this survey unit. 30 of those samples were part of the grid and the other 46 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.11.1 and mapped in Appendix 1, Figure 5-12.

Table 5.11.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)

EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.11.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.11.4. Conclusions

5.11.4.1. NaI scans taken on the surface of SU-11 after remediation revealed no elevated soil concentrations.

5.11.4.2. No FSS soil samples tested from SU-11 exceeded the DCGL_w.

5.11.4.3. SU-11 passed all screening tests except background and min/max.

5.11.4.4. SU-11 passed the statistical WRS test.

5.11.4.5. SU-11 meets all license criteria for release of a Class 1 survey unit.

5.11.5. Recommendations

5.11.5.1. SU-11 should be released from the license.

5.12. Survey Unit 12

5.12.1. SU-12 is a Class 1 survey unit. The survey unit is located at the north edge of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-13 to the east, SU-11 to the west and by Unit 400 to the south. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 1,710 m².

5.12.2. Remediation

5.12.2.1. Two areas were excavated to the north and to the east of Unit 400 to a maximum depth of 0.25 meters. The entire excavated area is presented in Appendix 1, Figure 5-13.

5.12.3. Final Status Survey Data

5.12.3.1. **Soil Samples** - 93 samples were collected from this survey unit. 32 of those samples were part of the grid, and the other 61 were bias samples. All samples were less than 1.0 FMPC. The data are summarized in Table 5.12.1 and mapped in Appendix 1, Figure 5-13.

Table 5.12.1

DCGLavg	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.12.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.12.4. Conclusions

5.12.4.1. NaI scans taken on the surface of SU-12 after remediation revealed no elevated soil concentrations.

5.12.4.2. No FSS soil samples tested from SU-12 exceeded the DCGL_w.

5.12.4.3. SU-12 passed all screening tests except background.

5.12.4.4. SU-12 passed the statistical WRS test.

5.12.4.5. SU-12 meets all license criteria for release of a Class 1 survey unit.

5.12.5. Recommendations

5.12.5.1. SU-12 should be released from the license.

5.13. Survey Unit 13

5.13.1. SU-13 is a Class 1 survey unit. The survey unit is located in the northeastern portion of the Kerr-McGee Technical Center Site. The survey unit is east of Unit 400, is bounded by SU-12 to the east, by SU-14 to the west, and by SU-15 to the south. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 1,750 m².

5.13.2. Final Status Survey Data

5.13.2.1. **Soil Samples** - 48 soil samples were collected from in this survey unit. 35 of those samples were part of the grid samples, and the other 13 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.13.1 and mapped in Appendix 1, Figure 5-14.

Table 5.13.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)

5.13.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure

4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.13.3. Conclusions

5.13.3.1. NaI scans taken on the surface of SU-13 revealed no elevated soil concentrations.

5.13.3.2. No FSS soil samples tested from SU-13 exceeded the DCGL_w.

5.13.3.3. SU-13 passed all screening tests except background.

5.13.3.4. SU-13 passed the statistical WRS test.

5.13.3.5. SU-13 meets all license criteria for release of a Class 1 survey unit.

5.13.4. Recommendations

5.13.4.1. SU-13 should be released from the license.

5.14. Survey Unit 14

5.14.1. SU-14 is a Class 1 survey unit. The survey unit is located in the northeastern portion of the Kerr-McGee Technical Center Site. The survey unit is east of Unit 400, is bounded by SU-13 to the east, by SU-24 to the west, and by SU-16 to the south. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 1,750 m².

5.14.2. Final Status Survey Data

5.14.2.1. **Soil Samples** - 43 soil samples were collected from this survey unit. 35 of those samples were part of the grid, and the other 8 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.14.1 and mapped in Appendix 1, Figure 5-15.

Table 5.14.1
FSS Data^{a,b}

5.14.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure

4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.14.3. Conclusions

5.14.3.1. NaI scans taken on the surface of SU-14 revealed no elevated soil concentrations.

5.14.3.2. No FSS soil samples tested from SU-14 exceeded the DCGL_w.

5.14.3.3. SU-14 passed all screening tests except background.

5.14.3.4. SU-14 passed the statistical WRS test.

5.14.3.5. SU-14 meets all license criteria for release of a Class 1 survey unit.

5.14.4. Recommendations

5.14.4.1. SU-14 should be released from the license.

5.15. Survey Unit 15

5.15.1. SU-15 is a Class 2 survey unit. The survey unit is located in the east area of the Kerr-McGee Technical Center Site. The survey unit borders the north and east sides of the main building, is bordered by SU-9 to the west, SU-11, 12, 13, 14, the Storage building and Unit 400 to the north and by SU-16, 17, 18, 19, and 20 to the east. Appendix 1, Figure 1-2 shows the survey unit and its location at the site. The area included in the survey unit is 7,512 m².

5.15.2. Final Status Survey Data

5.15.2.1. **Soil Samples** - 71 soil samples were taken in this survey unit. 35 of those samples were regular grid samples, and the other 36 were bias samples. All samples were less than 1.0 FMPC. The soil data are summarized in Table 5.15.1 and graphically represented in Appendix 1, Figure 5-16.

Table 5.15.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)
Grid	-0.2	35	0.4	2.0	-1.1	-0.4	0.0	0.3
Bias	0.2	36	0.5	3.9	-0.9	2.0	-0.1	0.2

^a FSS data includes characterization data

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.15.2.2. **Fixed Equipment** – Manhole access to affected piping exists in two locations in this survey unit. The accessible piping near the manholes was scanned internally with NaI along with the brick housing where accessible. BI sludge samples were taken within the access points under the manholes. The sludge samples were less than 1.0 FMPC. No scan above the threshold was detected. A summary of the data taken is presented in Table 5.15.1 and a map showing the location of the manholes is presented as Appendix 1, Figure 5-16.

Table 5.15.2
SU 15 Data from Two Manholes

X (meters)	Y (meters)	Average Scan^a	Maximum Scan^a	Sludge FMPC
425	708	1935	7210	-0.2
452	731	988	1390	-0.4

^a net of background

5.15.2.3. All tests required by the D Plan were passed except the Background Test. All tests required for release of a Class 2 survey unit were passed as shown in Table 5.15.3. The TCTR is presented in Tab 15 of Appendix 3.

Table 5.15.3
Screen Data and Statistical Test Report

Test Performed	FMPC	Must Pass
Min/Max	Pass	
Background	Fail	
DCGL _w	Pass	X
DCGL _{avg}	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.15.2.4. **Scans** –100% of the survey unit was scanned during characterization with a shielded detector as described in Section 4.6. One single location that exceeded the scan threshold was sampled²⁷ in accordance with Appendix 6. No elevated soil samples resulted from the scan survey. Since no other scans exceeded the investigative threshold and no remediation was performed in the survey unit, no further scans were performed.

5.15.3. Conclusions

5.15.3.1. The single NaI scan taken on the surface of SU-15 that was above the shielded scan survey threshold of 2500 cpm net of background corresponded to a soil sample that was below 1.0 FMPC.

5.15.3.2. No soil samples tested in SU-15 exceeded the DCGL_w.

5.15.3.3. SU-15 passed all screening tests except background.

5.15.3.4. SU-15 passed the statistical WRS test.

²⁷ Scan maximum of 3370cpm corresponded to Sample ID 765 which measured 0.2 FMPC.

5.15.3.5. SU-15 meets all license criteria for release of a Class 2 survey unit.

5.15.4. **Recommendations**

5.15.4.1. SU-15 should be released from the license.

5.16. Survey Unit 16

5.16.1. SU-16 is a Class 1 survey unit. The survey unit is located in the east area of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-14 and SU-24 to the north, SU-24 to the east, SU-15 to the west and by SU-17 to the south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 975 m².

5.16.2. Remediation

5.16.2.1. The excavated area in SU-16 is part of a larger excavation extending from SU-17, and is discussed in section 5.17 of this report. The area is shown in Appendix 1, Figure 5-17.

5.16.3. Final Status Survey Data

5.16.3.1. **Soil Samples** – 54 FSS samples were collected from this survey unit. 37 of those samples were part of the grid samples and the other 17 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.16.1 and mapped in Appendix 1, Figure 5-17.

Table 5.16.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)

5.16.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.16.4. **Conclusions**

5.16.4.1. NaI scans taken on the surface of SU-16 after remediation revealed no elevated soil concentrations.

5.16.4.2. No FSS soil samples tested from SU-16 exceeded the DCGL_w.

5.16.4.3. SU-16 passed all screening tests except background.

5.16.4.4. SU-16 passed the statistical WRS test.

5.16.4.5. SU-16 meets all license criteria for release of a Class 1 survey unit.

5.16.5. **Recommendations**

5.16.5.1. SU-16 should be released from the license.

5.17. Survey Unit 17

5.17.1. SU-17 is a Class 1 survey unit. The survey unit is located in the east area of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-24 to the east, SU-15 to the west, SU-16 to the north and by SU-18 to the south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,850 m².

5.17.2. Remediation

5.17.2.1. An area was excavated toward the western side of this SU to a maximum depth of 1.0 meters. The entire excavated area is presented in Appendix 1, Figure 5-17.

5.17.3. Final Status Survey Data

5.17.3.1. **Soil Samples** - 110 FSS samples were collected from this survey unit. 38 of those samples were part of the grid and the other 72 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.17.1 and mapped in Appendix 1, Figure 5-17.

Table 5.17.1

DCGL _{avg}	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.17.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.17.4. Conclusions

5.17.4.1. NaI scans taken on the surface of SU-17 after remediation revealed no elevated soil concentrations.

5.17.4.2. No FSS soil samples tested from SU-17 exceeded the DCGL_w.

5.17.4.3. SU-17 passed all screening tests except background and min/max.

5.17.4.4. SU-17 passed the statistical WRS test.

5.17.4.5. SU-17 meets all license criteria for release of a Class 1 survey unit.

5.17.5. Recommendations

5.17.5.1. SU-17 should be released from the license.

5.18. Survey Unit 18

5.18.1. SU-18 is a Class 1 survey unit. The survey unit is located in the east area of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-21 to the east, SU-15 to the west, SU-17 to the north and by SU-19 to the south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,700 m².

5.18.2. Remediation

5.18.2.1. An area of toward the eastern side of the survey unit was excavated to a maximum depth of 0.3 meters. The excavated area is shown in Appendix 1, Figure 5-18.

5.18.3. Final Status Survey Data

5.18.3.1. **Soil Samples** - 63 FSS samples were collected from this survey unit. 33 of those samples were part of the grid and the other 30 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.18.1 and mapped in Appendix 1, Figure 5-18.

Test Performed	FMPC	Must Pass
Min/Max	Pass	
Background	Fail	
DCGLw	Pass	
DCGLavg	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.18.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.18.4. Conclusions

5.18.4.1. NaI scans taken on the surface of SU-18 after remediation revealed no elevated soil concentrations.

5.18.4.2. No FSS soil samples tested from SU-18 exceeded the DCGL_w.

5.18.4.3. SU-18 passed all screening tests except background.

5.18.4.4. SU-18 passed the statistical WRS test.

5.18.4.5. SU-18 meets all license criteria for release of a Class 1 survey unit.

5.18.5. Recommendations

5.18.5.1. SU-18 should be released from the license.

5.19. Survey Unit 19

5.19.1. SU-19 is a Class 1 survey unit. The survey unit is located in the east area of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-15 to the east, SU-21 to the west, SU-18 to the north and by SU-20 to the south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,700 m².

5.19.2. Remediation

5.19.2.1. Four areas were excavated toward the center and west portions of the survey unit to a maximum depth of 0.25 meters. The entire excavated area is presented in Appendix 1, Figure 5-18.

5.19.3. Final Status Survey Data

5.19.3.1. **Soil Samples** – 190 FSS samples were collected from this survey unit. 33 of those samples were part of the grid, and the other 157 were bias samples. The FSS soil data are summarized in Table 5.19.1 and mapped in Appendix 1, Figure 5-18.

Table 5.19.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226	
			Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)	Mean (pCi/g)	Max (pCi/g)
Grid	0.3	33	2.1	24.0	-0.2	1.9	0.1	0.5

^a FSS data includes characterization data

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.19.3.2. **Elevated Samples** – A single area with elevated soil concentrations remained after remediation. 1 meter offset samples were collected to a depth of 1.0 m at the location. All offsets and depth samples were less than 1.0 FMPC. The Area Factor rule was applied and the results are listed in Table 5.19.2. This sample was not excavated.

Table 5.19.2
Area Factor for Elevated Area in SU-19

TCN	FMPC	Area (m ²)	Area Factor ²⁸ Allowable EMC ²⁹
2544	1.4	1.0	12.7

5.19.3.3. The Aggregate Elevated Area Test (AEAT)³⁰ was also applied using the following equation. The AEAT passed and the results are presented in Table 5.19.3.

$$\frac{\delta}{DCGL_w} + \frac{(\bar{X}_{EMC} - \delta)}{AF * DCGL_w} < 0.95$$

Where:

δ = Average of the systematic measurements in the survey unit excluding those measurements within the area of elevated activity

\bar{X}_{EMC} = Average concentration in elevated area (only the samples greater than DCGL_w)

AF = The area factor that corresponds to the area of elevated activity

Table 5.19.3
Aggregate Elevated Area Test (AEAT)

δ	DCGL _w	\bar{X}_{EMC}	AF	AEAT Result
-0.2	1	1.4	12.7	-0.1

5.19.3.4. All tests required by the D Plan were passed except the Min/max and Background Tests. All tests required for release of a Class 1 survey unit were passed as shown in Table 5.19.4. The TCTR lists all the FSS soil samples in the data set and is presented in Tab 19 of Appendix 3.

²⁸ NEXTEP Tech Memo 0201, *Derivation of Surface Soil DCGLs for KMTC: Table 4*. A.H. Thatcher, CHP.

²⁹ With application of the unity rule, the allowable EMC is equal to the Area Factor.

³⁰ MARSSIM, Section 8.5.2

Test Performed	FMPC	Must Pass
Min/Max	Fail	
Background	Fail	
DCGLw	Pass	
DCGLavg	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.19.3.5. **Fixed Equipment** – The limestone pit water treatment system is located in the western portion of SU-19 and consists of the sediment collection tank and the limestone filtration pit as shown in Figure 5-21.

5.19.3.6. Four sediment samples were taken from the bottom of the pit liner and 2 sediment samples were taken from the sedimentation tank. The results varied between -0.6 and 2.6 FMPC. All sediment was removed from the limestone pit and the sedimentation tank and disposed of at a LLRW facility.

5.19.3.7. The limestone from the pit was removed and surveyed with a shielded NaI detector and smear samples. The maximum NaI reading on the limestone was 1170 cpm gross and the maximum smear was 5 β pm/100 cm^2 . Since all measurements were below the release criteria, the old limestone was released and disposed of on site after the analysis was complete

5.19.3.8. Removable contamination measurements were taken on accessible points in the sedimentation tank, and on the bottom of the limestone pit. The wall of the pit liner were surveyed with β direct, NaI scans and removable contamination measurements. The maximum direct measurement was 384 β pm/100 cm^2 , which is much lower than the most conservative DCGLw for building surfaces (2,150 β pm/100 cm^2). The maximum removable measurement was 7 β pm/100 cm^2 , much lower than the release limit of 200 β pm/100 cm^2 .³¹ The results are summarized in Table 5.19.5.

³¹ D Plan Section 3.2.4.

Table 5.19.5

Limestone Pit Water Treatment System Survey Measurements

	# Measurements	Average	Maximum
3.5" NaI (cpm)	14	1559	2100
Beta Direct (β pm/100 cm ²)	8	201	384
Removable (β pm)	23	2	7
Sediment (FMPC)	6	0.5	2.6

5.19.3.9. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. One soil sample above the release limit resulted from the post remediation scans and was left in place.

5.19.4. Conclusions

5.19.4.1. NaI scans taken on the surface of SU-19 after remediation revealed a single area of elevated soil concentration. The area was small enough to be left undisturbed.

5.19.4.2. A single post-remediation FSS soil sample exceeded the DCGL_w. This sample is located in an area of no more than 1 m², and was left in place, as the area passed the tests required for release.

5.19.4.3. SU-19 passed all screening tests except min/max and background.

5.19.4.4. Final Survey measurements, (removable, direct, and shielded NaI scans) performed on the fixed equipment in SU-19 revealed no elevated concentrations.

5.19.4.5. SU-19 passed the statistical WRS test.

5.19.4.6. SU-19 passed the AEAT.

5.19.4.7. SU-19 meets all license criteria for release of a Class 1 survey unit.

5.19.5. Recommendations

5.19.5.1. SU-19 should be released from the license.

5.20. Survey Unit 20

5.20.1. SU-20 is a Class 1 survey unit. The survey unit is located in the southeast area of the Kerr-McGee Technical Center Site. The survey unit is bordered by SU-19 to the north, SU-21 to the east, SU-15 to the west, and SU-24 to the south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,700 m².

5.20.2. Remediation

5.20.2.1. Two areas were excavated to a maximum depth of 0.15 meters. The excavated areas are shown in Appendix 1, Figure 5-18. Another excavation area extending from SU-19 is discussed in section 5.19 of this report and will not be discussed here.

5.20.3. Final Status Survey Data

5.20.3.1. **Soil Samples** - 122 samples were taken in the soil that remained after remediation in the excavation area. 33 of those samples were part of the grid, and 89 were bias samples. The data are summarized in Table 5.20.1 and mapped in Appendix 1, Figure 5-18.

Table 5.20.1

Wilcoxon Rank Sum	Pass	X

5.20.3.3. **Scans** – A final scan of the survey unit was performed in January 2003. 100% of the survey unit was scanned after remediation was completed as described in Section 4.6. No elevated readings resulted from the scans.

5.20.3.4. **Fixed Equipment** – The water treatment system which extends into this survey unit is discussed in Section 5.19 of this report.

5.20.4. **Conclusions**

5.20.4.1. NaI scans taken on the surface of SU-20 after remediation revealed no elevated soil concentrations.

5.20.4.2. No FSS soil samples tested from SU-20 exceeded the DCGL_w.

5.20.4.3. SU-20 passed all screening tests except background and min/max.

5.20.4.4. SU-20 passed the statistical WRS test.

5.20.4.5. SU-20 meets all license criteria for release of a Class 1 survey unit.

5.20.5. **Recommendations**

5.20.5.1. SU-20 should be released from the license.

5.21. Survey Unit 21

5.21.1. SU-21 is a Class 1 survey unit. The survey unit is located in the eastern portion of the Kerr-McGee Technical Center Site. The survey unit is east of the water treatment system, is bounded by SU-22 to the east, by SU-16, SU-17, SU-18, SU-19, and SU-20 to the west, and by SU-24 to the north and south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,800 m².

5.21.2. Final Status Survey Data

5.21.2.1. **Soil Samples** - 56 soil samples were collected from this survey unit. 40 of those samples were part of the grid, and the other 16 were bias samples. All samples were less than 1.0 FMPC. The data are summarized in Table 5.21.1 and mapped in Appendix 1, Figure 5-19.

Table 5.21.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226

^b Nuclide values are net of mean background. FMPC is net of mean background plus 2 sigma.

5.21.2.2. All tests required by the D Plan were passed except the Background Test. All tests required for release of a Class 1 survey unit were passed as shown in Table 5.21.2. The TCTR lists all the FSS soil samples in the data set and is presented in Tab 21 of Appendix 3.

5.21.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure 4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.21.3. Conclusions

5.21.3.1. NaI scans taken on the surface of SU-21 revealed no elevated soil concentrations.

5.21.3.2. No FSS soil samples tested from SU-21 exceeded the DCGL_w.

5.21.3.3. SU-21 passed all screening tests except background.

5.21.3.4. SU-21 passed the statistical WRS test.

5.21.3.5. SU-21 meets all license criteria for release of a Class 1 survey unit.

5.21.4. Recommendations

5.21.4.1. SU-21 should be released from the license.

5.22. Survey Unit 22

5.22.1. SU-22 is a Class 1 survey unit. The survey unit is located in the eastern portion of the Kerr-McGee Technical Center Site. The survey unit is east of the water treatment system, is bounded by SU-23 to the east, by SU-21 to the west, and by SU-24 to the north and south. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,800 m².

5.22.2. Final Status Survey Data

5.22.2.1. **Soil Samples** - 56 soil samples were taken in this survey unit. 40 of those samples were part of the grid, and the other 16 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.22.1 and mapped in Appendix 1, Figure 5-19.

Table 5.22.1

Wilcoxon Rank Sum	Pass	X

5.22.3. Conclusions

5.22.3.1. NaI scans taken on the surface of SU-22 revealed no elevated soil concentrations.

5.22.3.2. No FSS soil samples tested from SU-22 exceeded the DCGL_w.

5.22.3.3. SU-22 passed all screening tests except background.

5.22.3.4. SU-22 passed the statistical WRS test.

5.22.3.5. SU-22 meets all license criteria for release of a Class 1 survey unit.

5.22.4. Recommendations

5.22.4.1. SU-22 should be released from the license.

5.23. Survey Unit 23

5.23.1. SU-23 is a Class 1 survey unit. The survey unit is located in the eastern portion of the Kerr-McGee Technical Center Site. The survey unit is east of the water treatment system, is bounded by SU-22 to the west, and by SU-24 on all other sides. This survey unit encompasses the area that contains lowland areas which occasionally fill with rain water or drainage water. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The area included in the survey unit is 1,800 m².

5.23.2. Final Status Survey Data

5.23.2.1. **Soil Samples** - 44 soil samples were collected from this survey unit. 36 of those samples were part of the grid, and the other 8 were samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.23.1 and mapped in Appendix 1, Figure 5-19.

Table 5.23.1

5.23.2.3. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure 4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.23.3. **Conclusions**

5.23.3.1. NaI scans taken on the surface of SU-23 revealed no elevated soil concentrations.

5.23.3.2. No FSS soil samples tested in SU-23 exceeded the DCGL_w.

5.23.3.3. SU-23 passed all screening tests except background.

5.23.3.4. SU-23 passed the statistical WRS test.

5.23.3.5. SU-23 meets all license criteria for release of a Class 1 survey unit.

5.23.4. **Recommendations**

5.23.4.1. SU-23 should be released from the license.

5.24. Survey Unit 24

5.24.1. SU-24 is a Class 2 survey unit. The survey unit is located in the eastern portion of the Kerr-McGee Technical Center Site. Appendix 1, Figure 1-3 shows the survey unit and its location at the site. The survey unit served as a buffer area to ensure that there were no areas of elevated radioactivity outside of the Class 1 areas nearby. The area included in the survey unit is 5,450 m².

5.24.2. Final Status Survey Data

5.24.2.1. **Scans** – A scan of this survey unit was performed in August 2002 as part of the site characterization. 10% of the survey unit was scanned with a shielded NaI detector. No scans above the threshold of 2500 cpm (net of background) were detected in this survey unit.

5.24.2.2. **Soil Samples** - 59 soil samples were taken in this survey unit. 49 of those samples were part of the grid, and the other 10 were bias samples. All FSS samples were less than 1.0 FMPC. The data are summarized in Table 5.24.1 and mapped in Appendix 1, Figure 5-20.

Table 5.24.1
FSS Data^{a,b}

Measurement Type (cm)	Max FMPC	Number of Survey Points	Uranium		Natural Th		Ra-226

Test Performed	FMPC	Must Pass
Min/Max	Pass	
Background	Fail	
DCGL _w	Pass	X
DCGL _{avg}	Pass	X
EMC	Pass	X
Wilcoxon Rank Sum	Pass	X

5.24.2.4. **Scans** – A final scan of the survey unit was performed in October 2000 as part of the site characterization. 100% of the survey unit was scanned with an unshielded NaI detector. The scan results are presented in Figure 4-4, Appendix 1. No scans above the investigative threshold of 2500 cpm (net of background) were detected in this survey unit.

5.24.3. Conclusions

5.24.3.1. NaI scans taken on the surface of SU-24 revealed no elevated soil concentrations.

5.24.3.2. No FSS soil samples tested in SU-24 exceeded the DCGL_w.

5.24.3.3. SU-24 passed all screening tests except background.

5.24.3.4. SU-24 passed the statistical WRS test.

5.24.3.5. SU-24 meets all license criteria for release of a Class 1 survey unit.

5.24.4. Recommendations

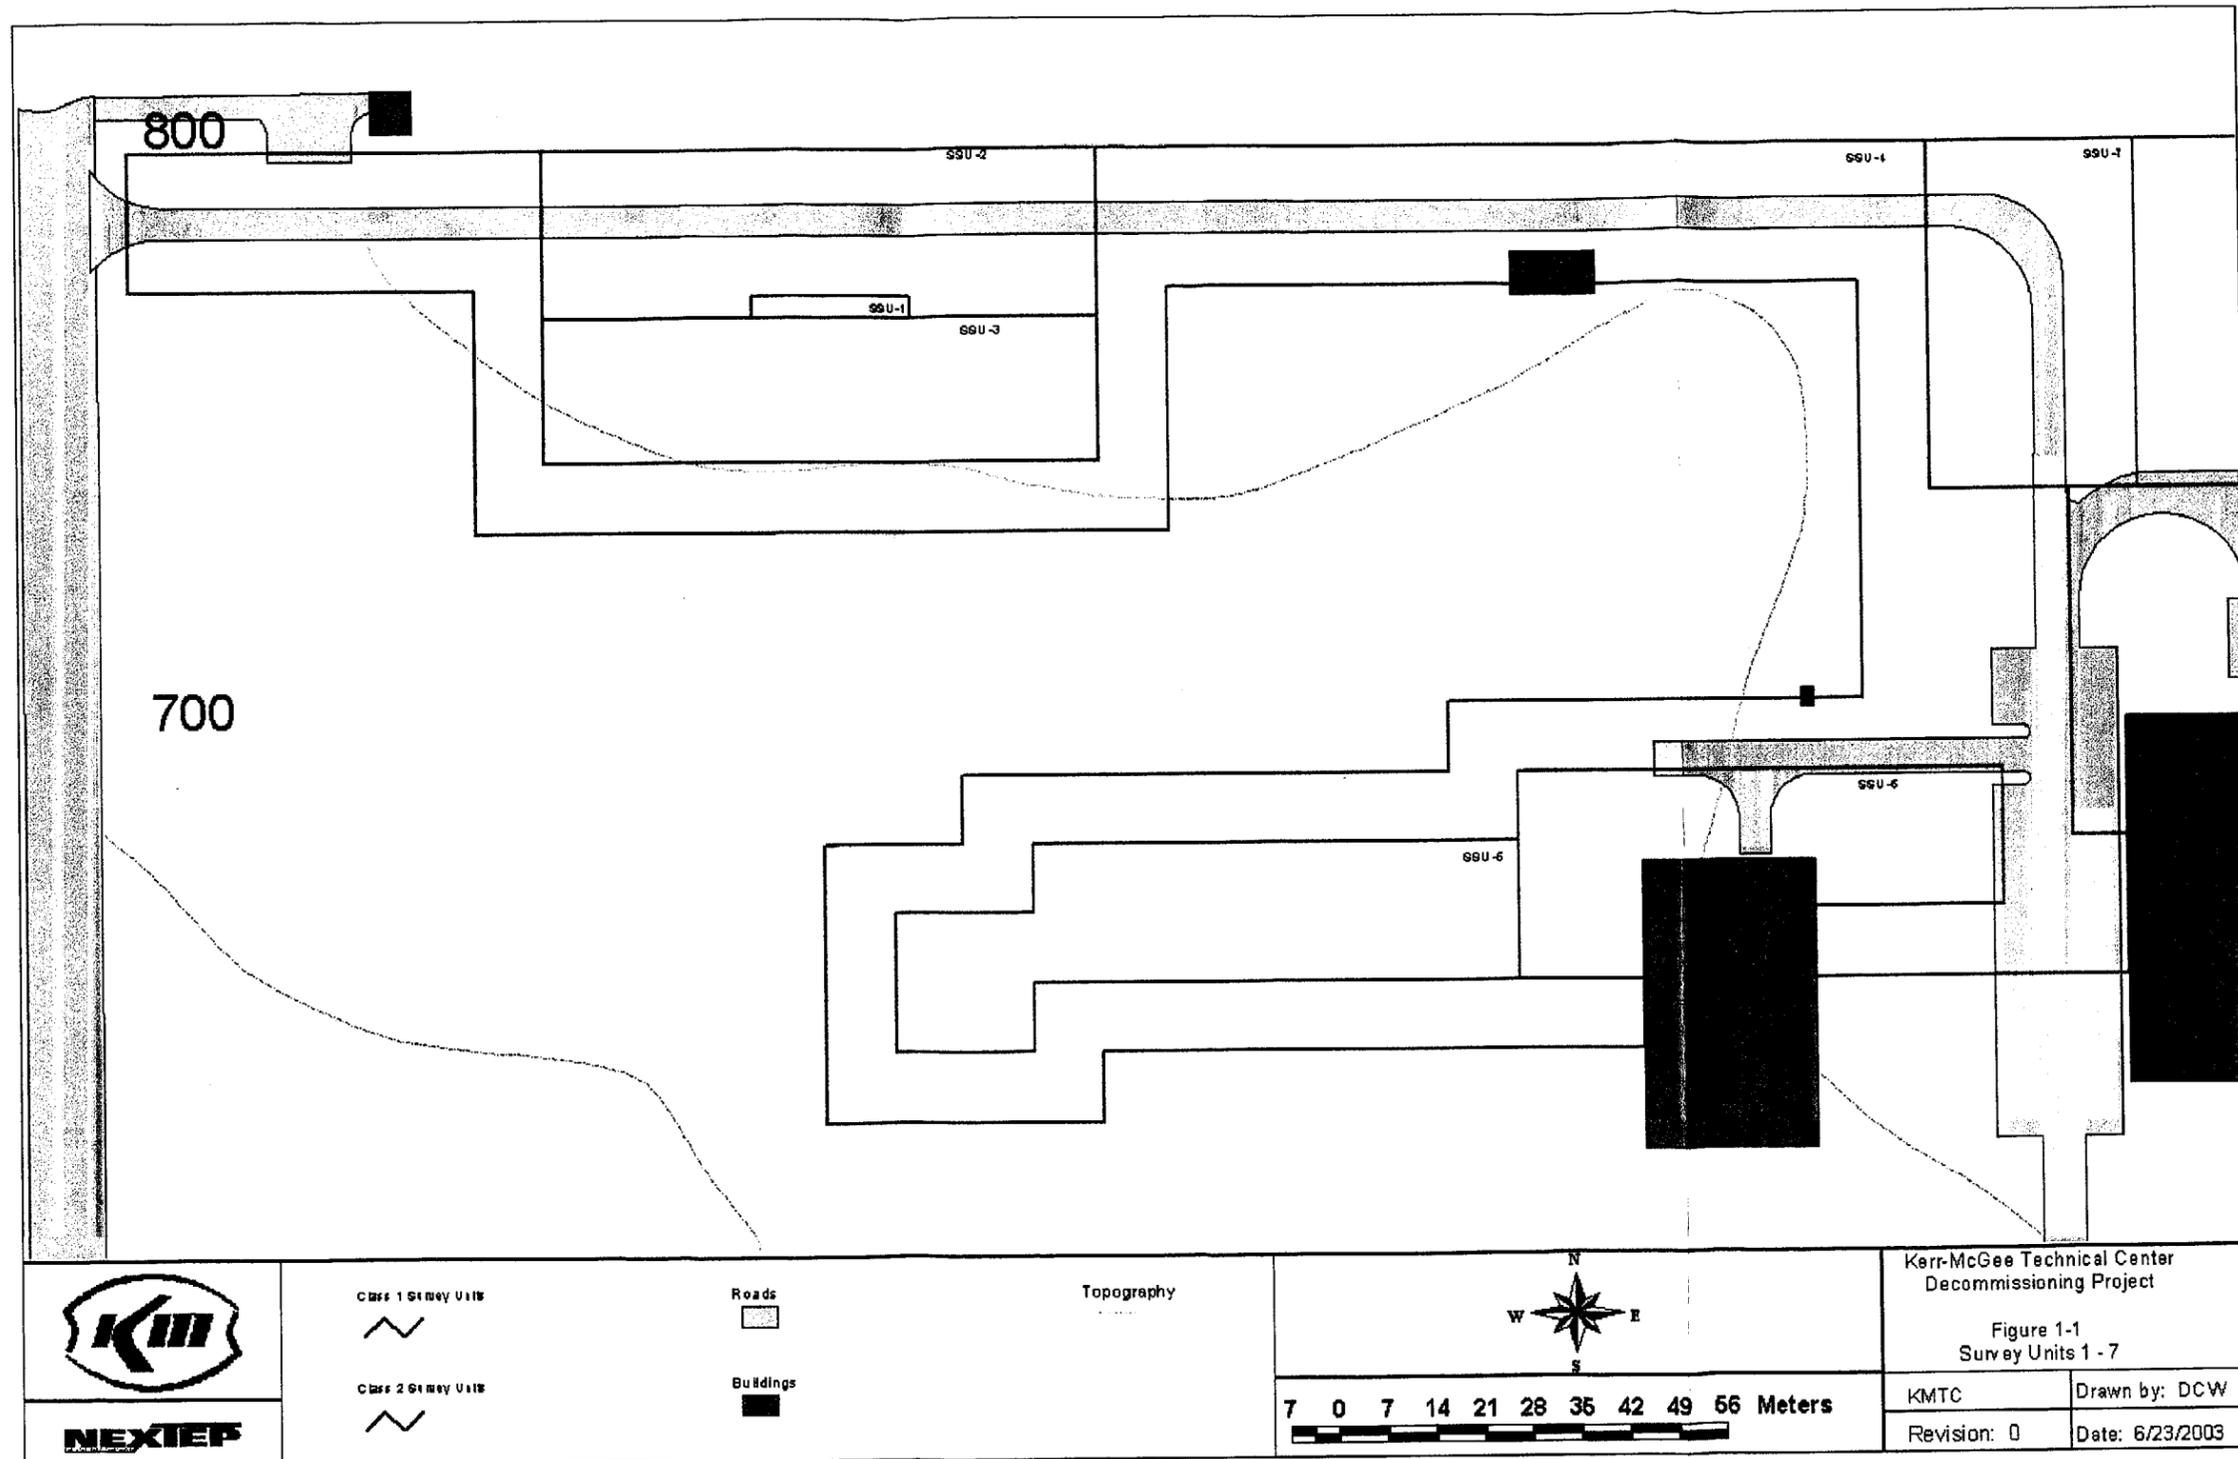

5.24.4.1. SU-24 should be released from the license.

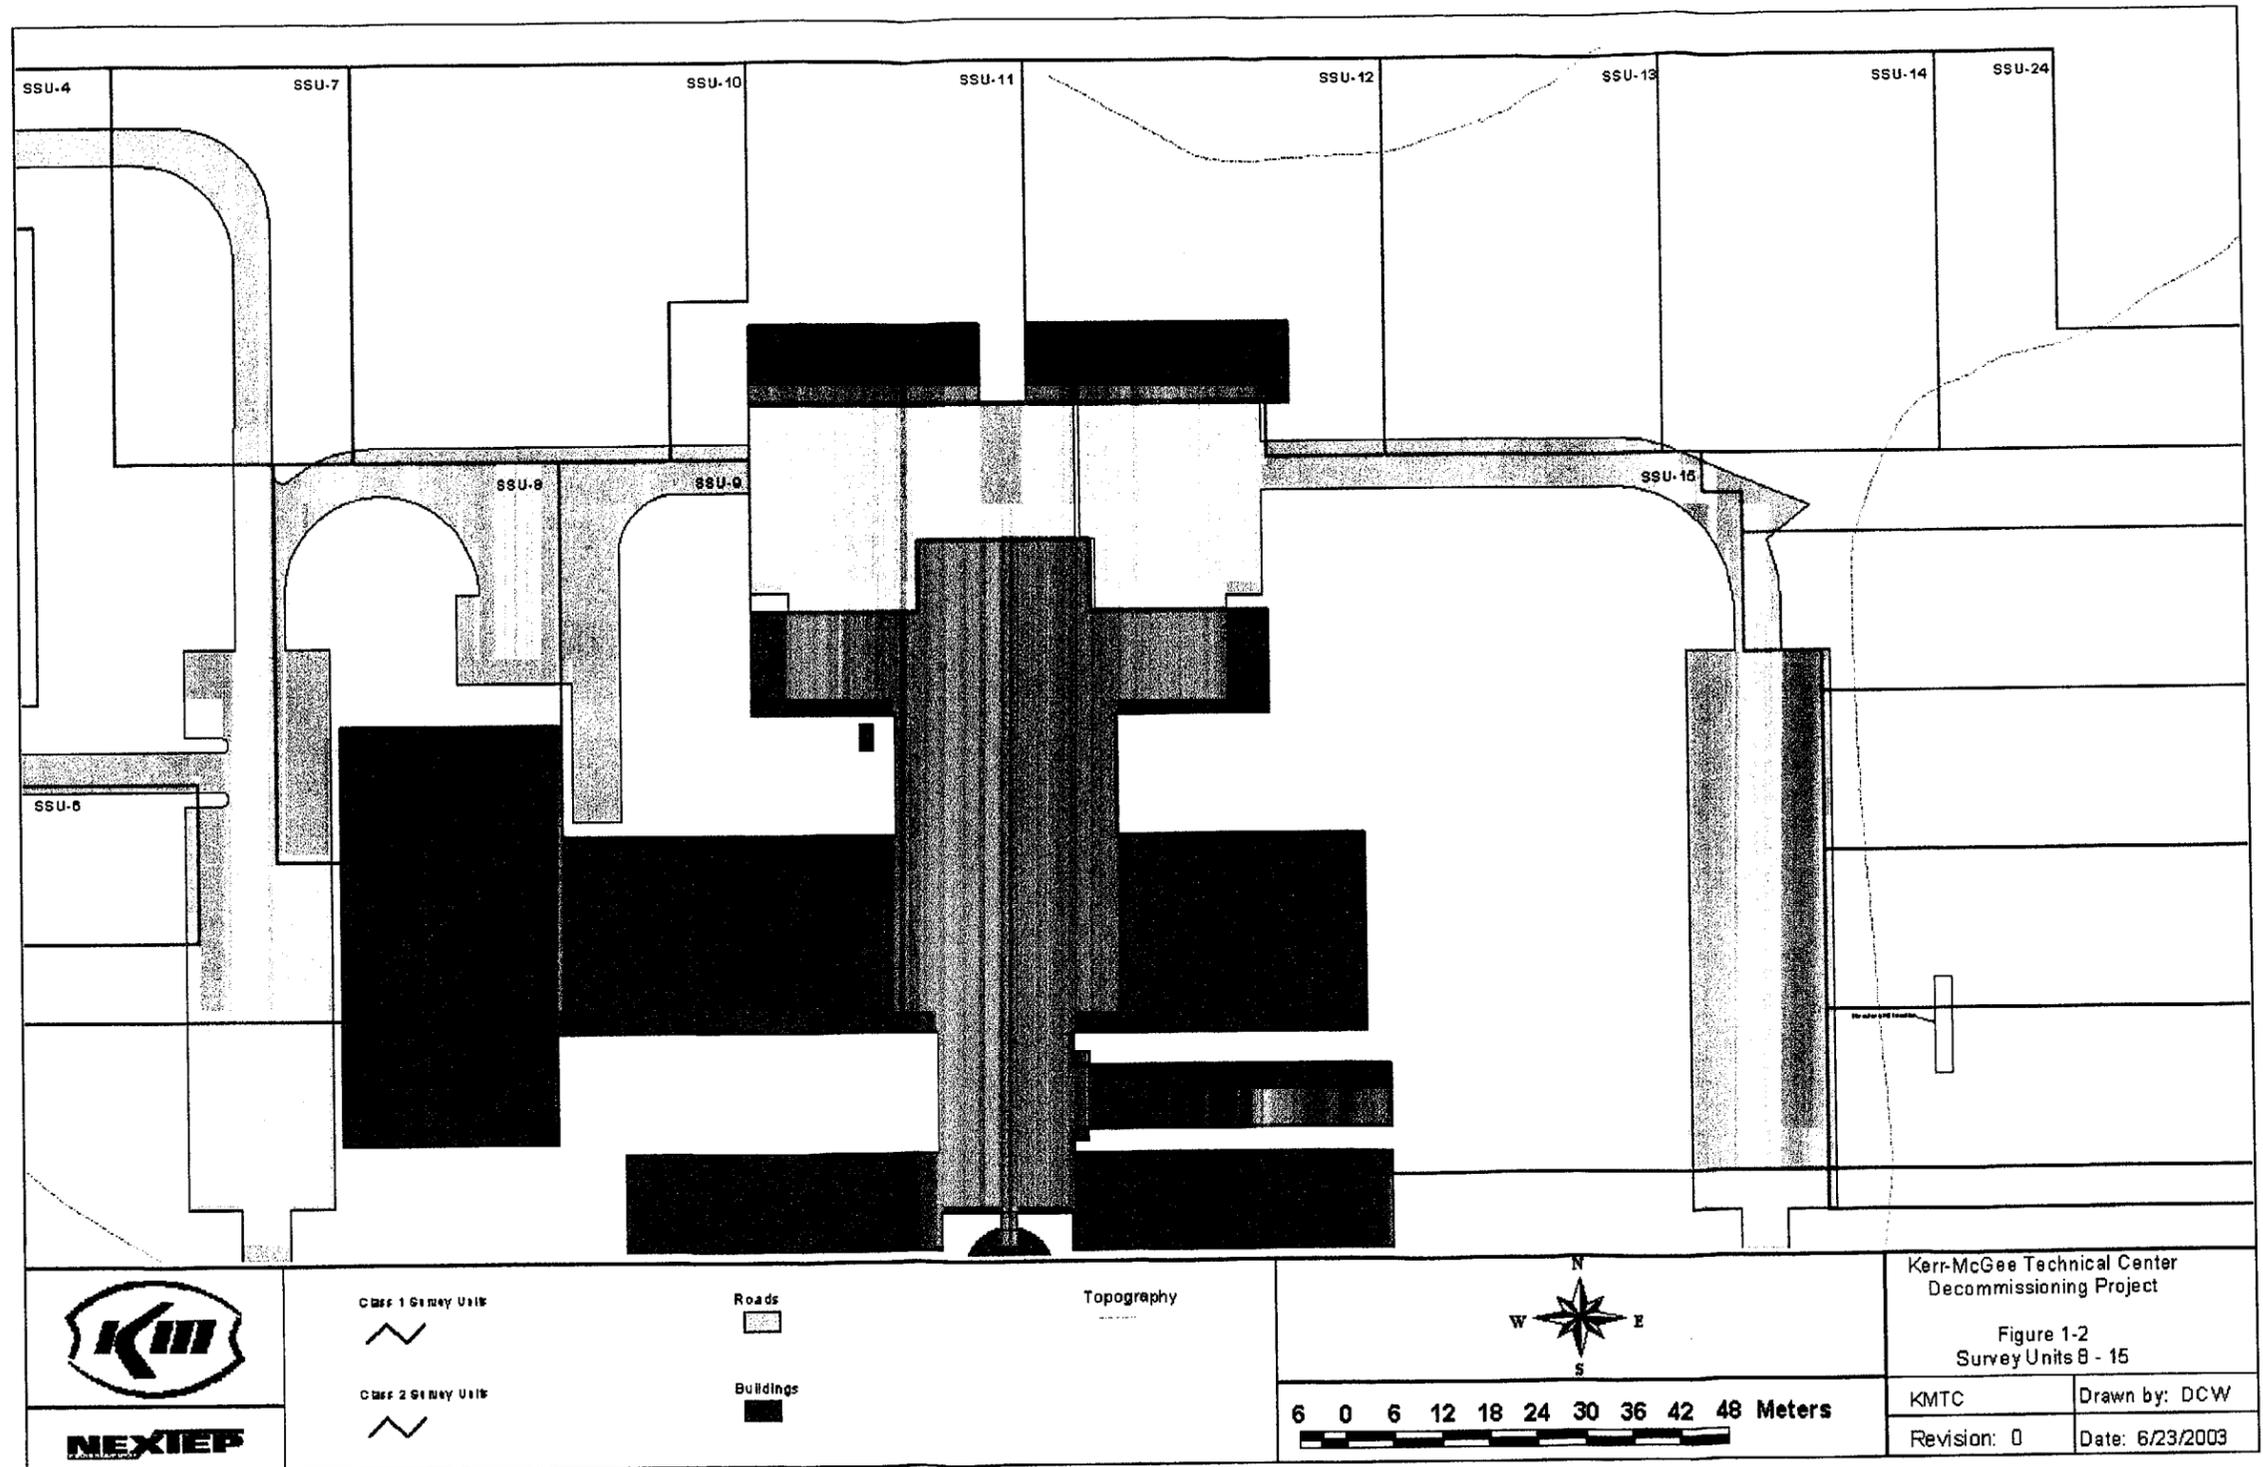

6. SUMMARY

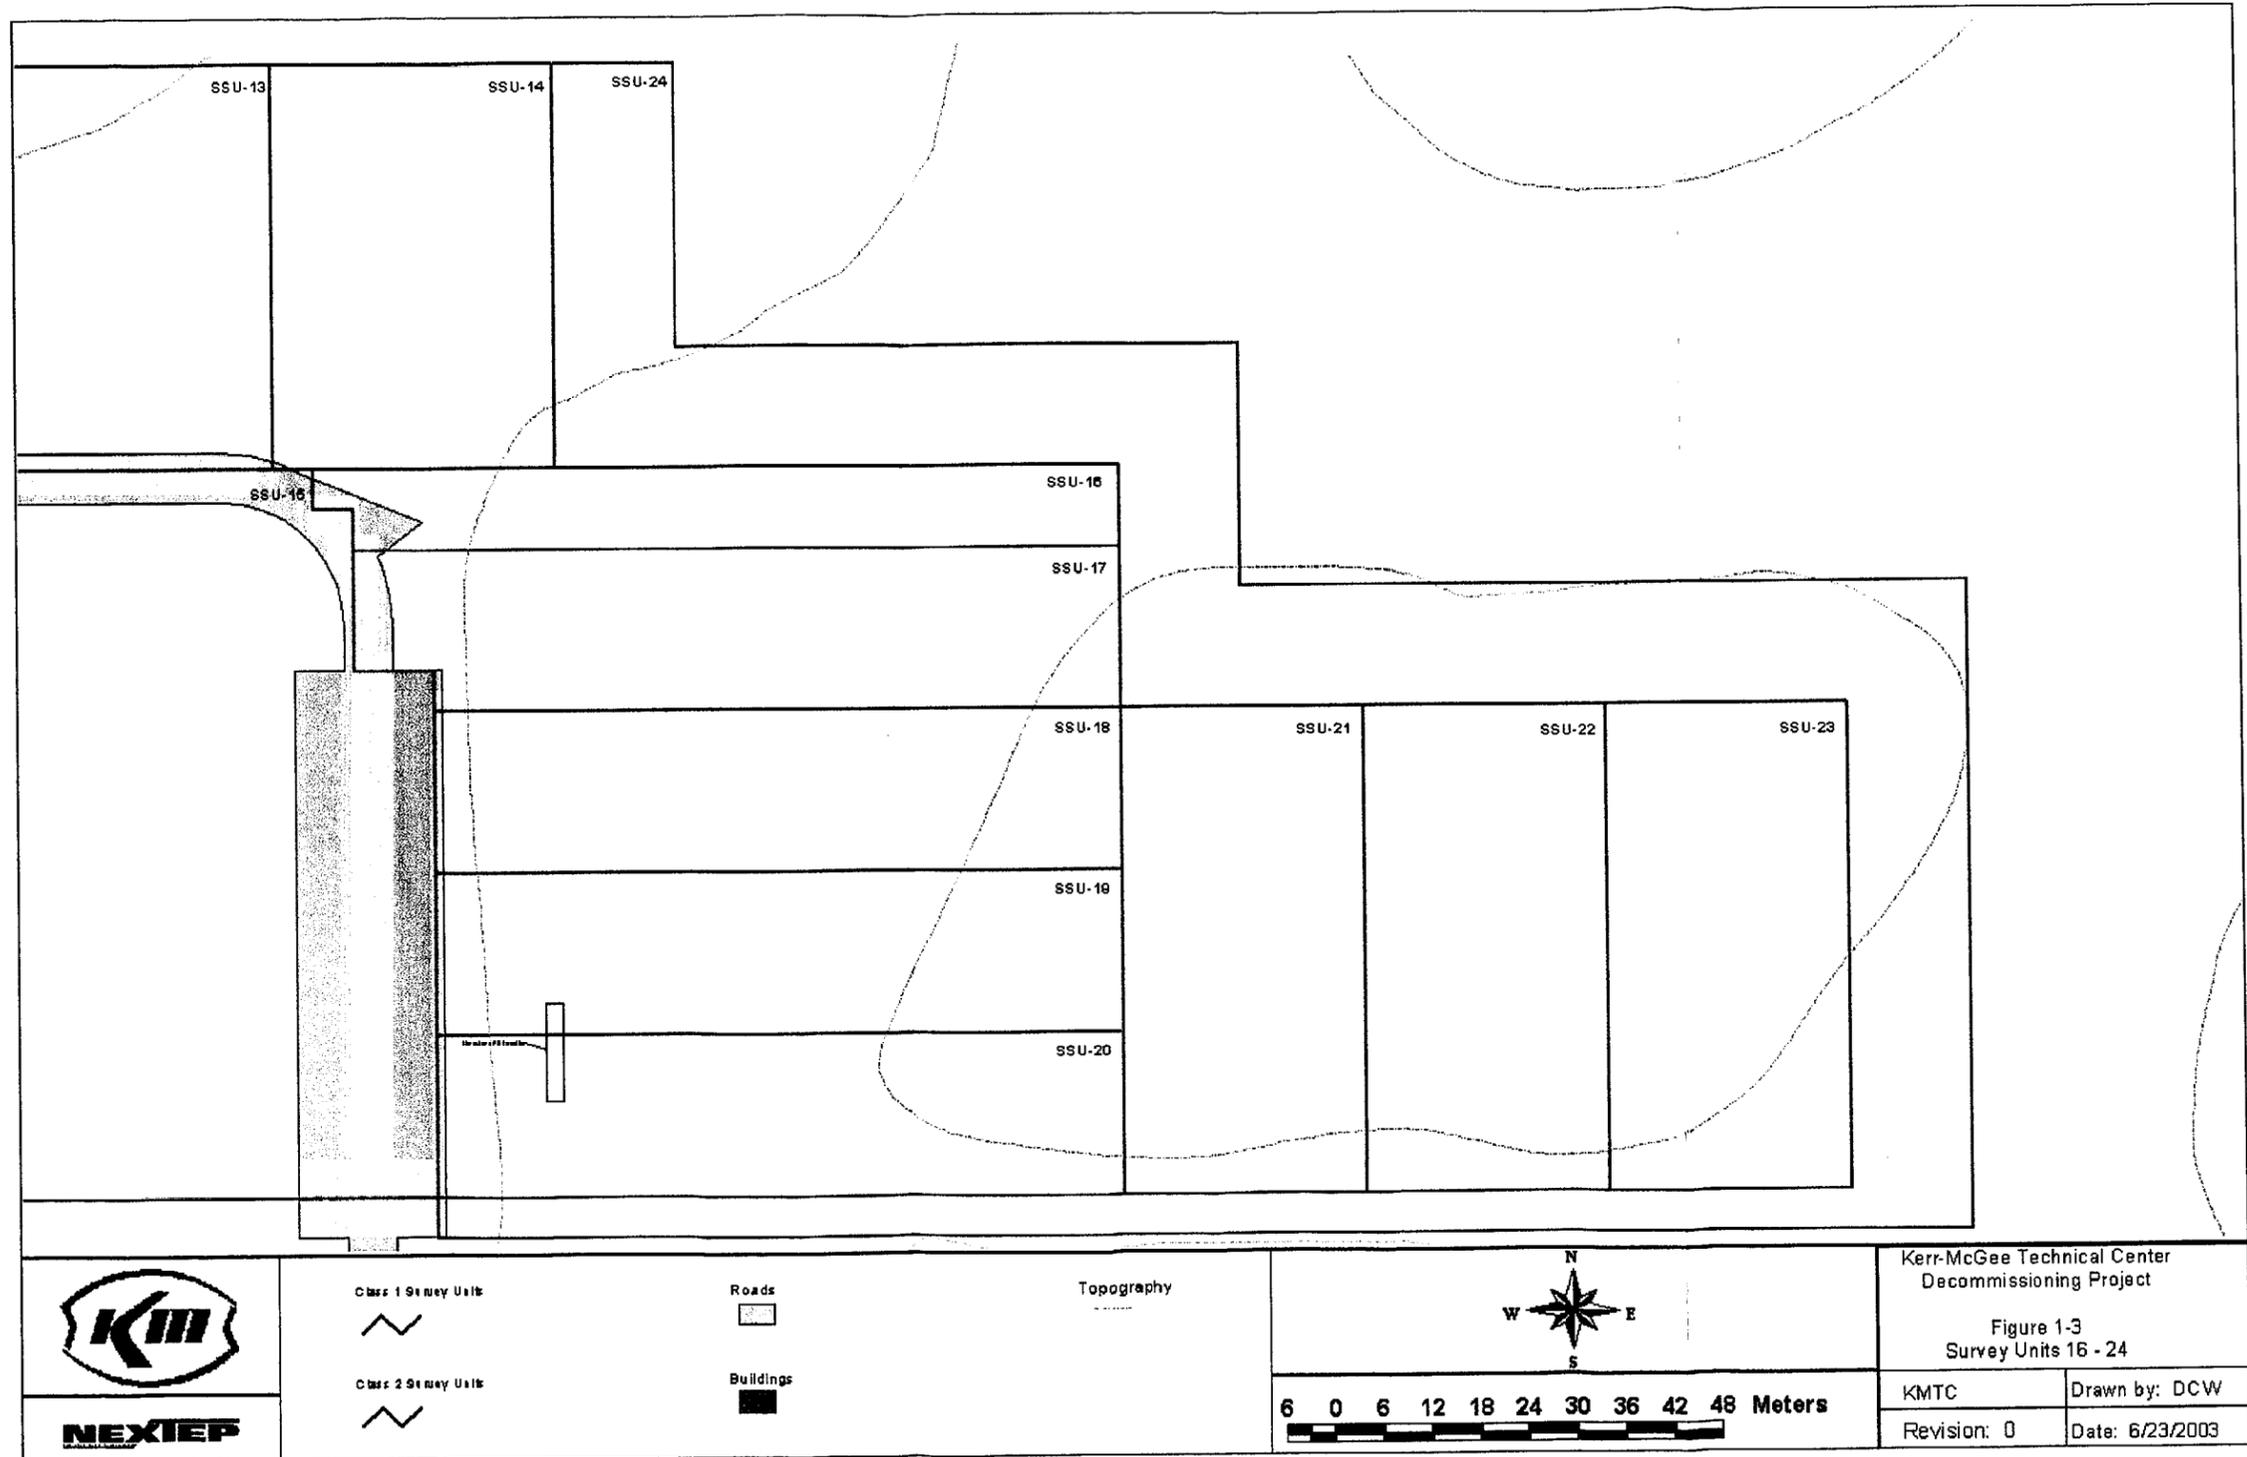

6.1. During the period between January 1999 and January 2003, the outdoor portions of the KMTC site were surveyed and remediated as described in the KMTC D Plan under License SUB-986. All necessary scans, surveys, and soil sample measurements were taken to ensure that no areas remaining on-site exceeded the NRC-approved decommissioning criteria. Kerr-McGee therefore requests that all of the outdoor areas of the KMTC site be released for unrestricted use from license SUB-986.

TECHNICAL MEMORANDUM 02-27

June 20, 2003

Originator: Barton P. Anderson
Subject: Verification of KMTC Radiation Database, Soils Portion
Revision: 0

ENDORSEMENT: This document contains the results of research and technical analysis which have been reviewed and approved for publication by the Technical Director, NEXTEP Environmental, Inc.

Harry J. Newman, CHP, Technical Director

Date

Introduction

The purpose of this paper is to document the results of verification testing of the Kerr-McGee Technical Center (KMTC) Radiation Database (RDB). The RDB has been developed for the storage, analysis and reporting of radiological survey data connected with the characterization and final status survey of various sites served by NEXTEP Environmental. It has been adapted and refined especially for the KMTC site.

The database covers both indoor surface radiation measurements and outdoor soil concentration measurements. The system was developed in Microsoft Access, a commonly available database prototyping tool, and is split into front and back ends. The back end consists of a single file, KMTC_Data.mdb, which resides on the web server at NEXTEP's headquarters and contains all of the data tables necessary for the storage and complete definition of the radiological survey data from KMTC. The front end consists of a single file, RDTS.mdb, which is the general Radiation Data Tracking System developed by NEXTEP and contains input/output forms, routines and queries plus the various standard reports used by the system. This allows the developer modify the front end without ever disturbing the data tables which contain the KMTC data.

The primary analysis tool is a detailed report developed and controlled within the database front end for the purpose of performing the tests and calculations required by the D Plan and MARSSIM as part of the FSS. One of these comprehensive reports exists for soil concentrations and one for indoor surface activity measurements.

Data are entered into the database tables via the Internet using the web interface scripts developed for KMTTC. This feature allows the data to be entered from any location having a browser and access to the internet. The web interface is limited only to data entry, quality control verification (QCV) reporting, and QC locking. However, the QCV report is versatile enough to enable anyone with a password to access the data and print out data sets based upon a wide variety of criteria. These data can be copied from the browser directly into a spreadsheet and manipulated further at the user's discretion. Only personnel with QC privileges may lock or unlock the records and, once locked, they may only be viewed, not changed, by other personnel accessing the files.

Verification tests of the web interface will be limited only to confirming the safety interlocks which are built into the system for data entry. The QCV reports which are produced for each survey data sheet entered into the system are a continual verification that the data entered from the original data sheet are correctly stored and returned by the system.

The rest of this verification report is concerned primarily with the analysis report for soils and will confirm that activity values are properly manipulated, screened and reported in accordance with the D Plan and MARSSIM requirements.

Methods

A test Soil Survey Unit (SU) was created which encompassed a rectangle defined by coordinates (10,600) and (50,550)³². Attachment A contains the last page of a report which defines all the survey units in the database. The portion within the box shows the boundaries of the test SU.

A test data set was created which was distributed across all the boundaries necessary to validate the software. These boundaries included NS and EW geographical boundaries of the test survey unit and measurements straddling the test values for background, DCGLw and EMC Thresholds for each nuclide. A spreadsheet containing all the data in this data set is presented in Attachment B. Elements of the data set which straddle the boundary conditions are highlighted in yellow.

Web Interface Evaluation

Data were entered on the web to confirm three safety interlocks.

³² All coordinates at KMTTC are referenced in meters east (x) and north (y) from the SW corner of the site. All KMTTC survey units are made up of rectangles defined by opposite corner coordinates. In the case of large, complex SUs a large number of adjacent rectangles are used. This design allows the system to pick out data points within each survey unit without going to a geographic information system (GIS) such as ArcView© to select the points within each polygon.

- No data point can be entered which used an instrument out of calibration.
- Duplicate data points may not be entered.
- Data may not be changed once they have been locked by QC.

Each of these interlocks have been demonstrated on the web and they have functioned correctly in normal use. This has been especially helpful in forcing careful consideration of instrument calibration status.

A sample of a QCV report is presented in Attachment C for a portion of the data in SU-22³³. Since the user logged in has a QC clearance, the buttons for locking and unlocking the dataset are shown in the Attachment. These are not present for non-QC users.

These tests plus the continual use of the QCV reports to review all data entry by QC confirms that the web interface is accurate and suitable for data entry, review and QC reporting.

Analysis Computations Evaluation

GENERAL

Attachment D contains the specification for calculation of nuclide fractional concentrations and performance of each of the tests specified in the D Plan. Each of these equations were programmed into the report scripts according to Attachment D.

Attachment E contains the output of the soil Threshold Comparison Test Report (TCTR) for the test data set. This report was run for SU-99 using selected data points of type RG (regular grid) and BI (bias). The output type selected was SOF (sum of the fractions³⁴) and the denominator concentrations used were the Derived Concentration Guideline (DCGLw) default values listed in Table 1.

Table 1
Default DCGLw Values³⁵

Nuclide	DCGLw (pCi/g)
U	228
Th	5.3
Ra	3.5

³³ The test data could not be shown since the web interface points to the live database file which does not contain the test data set.

³⁴ SOF is also referred to as FMPC: Fractional Material Permissible Concentration.

³⁵ Used in the denominator terms of the FMPC equations (see Attachment D). Obtained from Appendix C of the D Plan

A complete listing of all the data samples taken within the survey unit is produced by the report sorted by tests failed. The Wilcoxon rank sum test output can include all the data points used for the computation if requested by the user. However for this report, and most of the time, the complete data listing is suppressed and only the summary test results are shown.

Attachment F contains the output of the soil TCTR for the test data set with output selected based upon thorium concentrations. In this report the screening tests are performed only on the thorium concentrations although all three nuclides plus FMPC are listed.

By inspection of these reports all the essential computations and screening or statistical tests may be verified. The following paragraphs discuss each element of the verification.

SU DATA SELECTION

Comparison of the test data set provided in Attachment B with Attachment E shows that, at the western boundary of the survey unit, sample ID (SID) 9900 was excluded while SID 9901, which lay on the western boundary, was included. To the east, SID 9902 was included but SID 9903, which lay on the eastern boundary was excluded³⁶. Similarly for the northern and southern boundaries, SID's 9928, 9931, and 9932 were all excluded. The point on the southern boundary, SID 9929, was included while SID 9931, located on the northern boundary, was excluded. All the data points in the test data set except these 5 were included in the report (28 points selected).

Within the scope of these tests, the TCTR correctly identifies all survey data points that lie within a given survey unit's boundaries.

BACKGROUND CALCULATIONS AND THRESHOLD SUMMARY

Page 4 of Attachment E shows the summary of background data used for the report and the thresholds calculated for each nuclide. The average and standard deviation values were verified using the entire background data set of 291 soil measurements copied from the database into a spreadsheet. This data set is presented in Attachment G. The values were calculated using the Average and StDev functions within Excel and the results are presented in Table 2. The value for the background threshold (T_{BK}) is also calculated and shown in Table 2.

Table 2
Background Calculations

	U	Th	Ra
Average	1.760	2.289	0.644
Sigma	0.901	0.260	0.109
T_{BK}	3.562	2.809	0.862

³⁶ The software is written to include the western and southern boundaries within each survey unit. The other two boundaries belong to the adjacent survey units.

The DCGLw Threshold (T_d) is defined as the DCGLw value entered into the report setup screen plus T_{BK} . Similarly, the EMC threshold, (T_e) is obtained by adding the EMC value from the setup screen to T_{BK} .

The sigma multiplier was set to a value of 2.0 on the TCTR setup screen, DCGLw was set to 1, and EMC was set to 3. T_{BK} , T_d and T_e were calculated as shown in Attachment D. Inspection of page 4 of Attachment E shows that the values for average, sigma and all three thresholds are correct.³⁷

Within the scope of these tests, the KMTC RDB correctly calculates background mean and standard deviation and all associated thresholds needed for the threshold tests.

CALCULATION OF FMPC

Calculations of FMPC were verified manually. One example is provided as follows for SID 9927 (the first data point listed on page 2 of Attachment E).

$$FMPCs = \frac{690 - (3.562)}{228} + \frac{20 - (2.809)}{5.3} + \frac{15.7 - (0.862)}{3.5} = 10.494$$

Comparison with page 2 of Attachment E shows that the KMTC RDB calculates the values for FMPC correctly.

THRESHOLD SCREEN TESTS (Background, DCGLw, and EMC)

Attachment E shows the results of the analysis for the sum of the fractions, or FMPC. The background test is failed whenever a value for FMPC exceeds zero (i.e. the survey value lies above the background threshold).

The default value for DCGLw used in the FMPC version of the TCTR is always 1.0 since, by definition, $FMPC=1.0$ occurs when the combined residual contamination of all three nuclides is one DCGL above the background threshold. The default limit for EMC is set arbitrarily at 3.0.

Inspection of the TCTR in Attachment E shows that the system has sorted the values correctly for the FMPC version of the report.

On the boundary of each threshold manual calculations confirmed the computer sort. Manual calculations for SID 9913 yield a value for $FMPC=1.029$ which correctly shows as having failed the DCGLw Test. Similarly, SID 9909 calculated to 0.008 FMPC and therefore appears correctly in the list of points that failed background.

³⁷ The threshold calculations are carried out correctly to 10 decimal places in the computer. However, because each result is displayed to two decimal places, the results may appear to add incorrectly in some cases.

Attachment F shows the results of the analysis for the radionuclide, thorium. Using values for DCGLw and EMC of 5.3 and 15.9 respectively, the thresholds for thorium are calculated and presented in Table 3.

Table 3
Thorium Thresholds (pCi/g)

DCGLw	5.300
EMC	15.900
TBk	2.809
Td	8.109
Te	18.709

Inspection of the TCTR in Attachment F shows that it has correctly sorted the data points at each threshold. A similar inspection of the remaining two nuclides was conducted and the results were satisfactory. Within the scope of these tests, the TCTR correctly applied the screening tests to FMPC values and to each radionuclide's activity.

DCGL AVERAGE TEST

The DCGLavg test was examined for all three nuclides. The full data set of points included in SU-99 was copied to an Excel spreadsheet which is presented in Attachment J. All the necessary calculations were programmed into the spreadsheet and the results are presented in Table 4.

Table 4
DCGLavg Test Results

	U	Th	Ra	FMPCm
Average	174.40	6.05	5.88	2.96
Avg BK	1.76	2.289	0.644	NA
DCGLw	228.00	5.30	3.50	1.00
Sum	229.80	7.59	4.14	1.00
Test	P	P	F	F

The value for average activity in the summary page of Attachment F shows that the SU passed the DCGLavg test and that the average value of the survey measurements was 6.1 pCi/g. Both other nuclides were examined and showed similar agreement with Table 3 with radium being the only nuclide to fail the test.

For the FMPC report in Attachment E, the DCGLavg test is based upon FMPCm (see Attachment B) and the data in Table 4 show that the survey unit fails. Attachment E shows the average activity and fail status correctly.

Within the scope of these tests the KMTC RDB correctly computes the DCGLavg tests for all three radionuclides and the FMPC.

MIN/MAX TEST

The value for average activity on the summary page of Attachment F (Thorium TCTR) shows that the survey unit fails this test because the maximum survey value minus the minimum background value is greater than the DCGLw. An inspection of the data set in the report and Attachment G shows that the maximum and minimum values are stated correctly and that the fail status is correct. Similar comparisons were made for the remaining nuclides.

Attachment E shows that the survey unit fails based upon the values for maximum survey FMPCg and minimum background FMPCg. Manual calculations for these values are shown in Attachments G and J for comparison.

Within the scope of these tests the KMTC RDB correctly calculates and applies the Min/Max test as described in the D Plan and the specification (Attachment D).

OTHER SUMMARY VALUES

Additional summary data are displayed on the first page of the report. By inspection, the borders of the survey unit match those input into the system and the area calculated is correct.

The filters applied to the data by measurement type and date are faithfully represented and properly carried out in both Attachments E and F.

Each of the tests performed show the correct pass/fail status.

The maximum survey values, minimum background and difference are correctly shown as discussed under Min/Max test.

The average activity for the survey unit is correctly shown as discussed under DCGL-average test.

WILCOXON RANK SUM TEST

For soils at KMTC only the Wilcoxon test will be performed. This test is described in detail in chapter 8 of MARSSIM³⁸. The critical value for the test is given in tabular form in Appendix I of MARSSIM or it may be calculated using the following equation³⁹:

³⁸ NUREG-1575, Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM)

³⁹ MARSSIM Appendix I pg I-10

Where:

m = the number of background points

n = the number of survey points

z = 1.645 (corresponds to $\alpha = 0.05$)

In the examples shown in Attachments E and F there are 291 background points and 24 survey points. This can be confirmed by counting the points labeled RG in the report.⁴⁰ The number 291 is the count of all the background points in the database tested and is confirmed in both Attachment G and the background summary portion of the TCTR. Substituting these values into the above equation, a hand calculation yields a critical value of 46,683 which is confirmed at the end of both Attachments E and F.

By inspection it can be seen that the statistical test module correctly filters out only the regular grid data points for inclusion in the rank sum test.

All 313 data points used in this test are stored within the database in a temporary table for use in the computations. For the thorium TCTR (Attachment F), this table was copied onto an Excel spreadsheet. Then the ranks were calculated separately using the formula:

$$\text{Rank} = \text{RANK}(X, \text{Range}, 1) + ((\text{COUNTIF}(\text{Range}, X) - 1) / 2)$$

This formula ranks duplicate values in the way specified by MARSSIM.

The spreadsheet results were compared with those in the temporary Wilcoxon table produced by the database and the comparison is presented in Attachment H. The center portion of the spreadsheet is hidden for brevity. The columns shaded in green are those calculated by the spreadsheet and the others are from the temporary table in the database. Inspection of the table shows that the ranks calculated by the spreadsheet are the same as those produced by the report. Duplicates are handled in accordance with MARSSIM guidance.

The leftmost green column simply deletes all the ranks that do not correspond to background points and the sum of these ranks is shown at the bottom. This value, 46,508, is the same as the value calculated at the end of the report. The report correctly evaluates the comparison between the rank sum, W_r , and the critical value, W_c , and fails the test.

Within the scope of these tests, the KMTC RDB correctly applies the Wilcoxon Rank Sum Test to the data set and correctly reports Pass or Fail.

REMEDIATED DATA POINTS

When samples have been removed due to remediation, the letter R is applied to the field RESOLUTION and the report may be run excluding these data. This allows the user to keep all

⁴⁰ The Wilcoxon test applies only to systematic grid data points (RG or PG). The survey unit has only 24 such points.

the data intact and report on conditions before or after remediation at will. The data set for SU-99 was modified to remove all data points above FMPC = 1.0 and the FMPC report was run again. The results are presented in Attachment I.

Attachment I shows that all the points coded R have been removed and all tests except Min/Max and Background have passed. The screens are correctly applied and the Wilcoxon shows that the survey unit now passes.

Within the scope of these tests, the removal of remediated data points is correctly performed and reflected in the Threshold Comparison Test Report.

Conclusions

1. The KMTC Radiation Database System web interface has been shown to accurately record soil data from the KMTC decommissioning project and report the same data in accurate Quality Control Verification reports.
2. The calculations and tests called for in the D Plan and Attachment D are correctly performed including Min/Max, EMC, DCGLw, Background, DCGLavg, and Wilcoxon Rank Sum tests. All the supplementary data reported on the TCTR summary sheet are accurate and complete.

Recommendations

1. The KMTC RDB Soil Threshold Comparison Test Report should be used as the primary vehicle for analysis of KMTC soil data and Final Status Survey reporting and evaluation for release.

Distribution: NEXTEP; KMTC; Cimarron

MEMORANDUM

DATE: June 19, 2003
TO: Toni Steinhauer
FROM: Bart Anderson
RE: Specification for KMTC Database Threshold Comparison Screening Report (TCTR) - Revision 2
CC: Harry Newman; Drew Thatcher

This Specification Modification will clarify and document the calculations that go into the subject report which is generated by our Radiation Tracking Database System (RDTS) for the KMTC project. It will also specify certain minor changes to the output.

1. Fractional concentration data will be calculated in three ways according to the three following equations:

a.
$$FMPCs = \frac{U_s - (\bar{U}_b + 2 * \sigma_{U_b})}{228} + \frac{Th_s - (\bar{Th}_b + 2 * \sigma_{Th_b})}{5.3} + \frac{Ra_s - (\bar{Ra}_b + 2 * \sigma_{Ra_b})}{3.5}$$

b.
$$FMPCm = \frac{U_s - \bar{U}_b}{228} + \frac{Th_s - \bar{Th}_b}{5.3} + \frac{Ra_s - \bar{Ra}_b}{3.5}$$

c.
$$FMPCg = \frac{U_s}{228} + \frac{Th_s}{5.3} + \frac{Ra_s}{3.5}$$

2. The variables in the equations are defined as follows:

- a. FMPC is the Fractional Material Permissible Concentration. Subscript s means calculated including the 2σ term in the background. Subscript m means calculated using mean background only. Subscript g means no background data were included in the calculation (gross value).
 - b. U_s is the survey value for uranium in pCi/g. Likewise for Thorium and Radium.
 - c. \bar{U}_b refers to the mean value for the background uranium concentrations in the data set for the applicable matrix.
 - d. σ_{Ub} refers to the standard deviation of the background uranium concentrations in the data set for the applicable matrix.
 - e. Items b,c, and d apply similarly for thorium and radium.
 - f. The terms in parentheses in equation 1.a are the calculated background thresholds for each nuclide which are reported in the background report as Tbk_U , Tbk_{Th} , and Tbk_{Ra} .
 - g. The numbers in the denominators are the Derived Concentration Guidelines (DCGL's) for each nuclide as reported in the D Plan.
3. The screening tests which are conducted by the report software will be performed as follows:
- a. EMC Screen: Each data point will be tested. The data record and the survey unit fail if either of the following equations are true (Only U is shown for the single nuclide tests. The equation applies to the other nuclides as well).
 - i. $U_s > DCGL_{EMC} + Tbk_U$ (See par. 2.f.)
 - ii. $FMPC_s > FMPC_{EMC}$ where $FMPC_{EMC}$ is the a priori maximum FMPC established for EMC. (Default in the report setup will be 3).
 - b. DCGL_w Screen: Each data point will be tested. The data record and the survey unit fail if either of the following equations are true:
 - i. $U_s > DCGL_w + Tbk_U$
 - ii. $FMPC_s > DCGL_w$ Default DCGL_w for the FMPC report⁴¹ will be set to 1.0 but should be changeable.
 - c. Background Screen: Each data point will be tested. The data record and the survey unit fail if either of the following equations are true:
 - i. $U_s > Tbk_U$
 - ii. $FMPC_s > 0.0$
 - d. Min/Max Test: The survey unit fails the test if the following equation is true of the data set:
 - i. $Maximum(U_s) > DCGL_w + Minimum(U_b)$
 - ii. $Maximum(FMPC_g) > DCGL_w + Minimum(FMPC_{g_{BK}})$

⁴¹ Also referred to in the database as Sum of Fractions (SOF) Report.

Where $FMPC_{gBK}$ refers to the value for $FMPC_g$ calculated over the background data set applicable to the Survey Unit.

- e. $DCGL_{avg}$ Test: The survey unit fails the test if the following equation is true of the data set:
 - i. $\bar{U}_s > DCGL_w + \bar{U}_b$ where \bar{U}_s is the average of all the survey values in the data set.
 - ii. $FMPC_m > DCGL_w$ ⁴²
 - f. Wilcoxon Statistical Test: For the $FMPC$ report, this test will be performed on the survey unit data set selected using only grid points (RG,PG) and on all the background data points in the table for the applicable matrix (at present it is always soil). For both survey and background data points use $FMPC_g$. Create the "adjusted background" values by adding 1.0 ($DCGL_w$ value) to the value for background $FMPC_g$. The rest of the calculations are the same as for a single nuclide report.
4. **Report Setup.** In the report setup screen always set the three $DCGL_w$ values to the defaults shown in the denominators of equations 1a,1b, and 1c above but allow them to be changed by the user. Always open the report in the $FMPC$ mode (formerly SOF) and set $DCGL_w$ and EMC defaults to 1.0 and 3.0 respectively. Allow these also to be changed. When the radio button is pressed for any of the single nuclide reports, automatically load the $DCGL_w$ with the default value for the selected nuclide. Default the EMC to three times the $DCGL_w$ value. Allow these to be changed as well.
 5. Adjust the body of the report to show the values for $FMPC_s$ under the column heading $FMPC$. Add a footnote to the report which states, "All concentrations shown include background. $FMPC$ is calculated net of background plus 2 sigma."
 6. **Background Report.** Alter the format of the background report that prints at the end of each run. Include a line for each of the three nuclides listing the thresholds for each as well. Add a line for $FMPC$ and show the mean value of $FMPC_g$ and sigma only. Threshold values in this case would be meaningless. These four lines should be repeated for each matrix in the database. (For soil there will rarely, if ever, be more than one).

⁴² Default $DCGL_w$ for SOF report is 1.0.

Soil Threshold Comparison Test Report (Remediated)

KERR-MCGEE TECHNICAL CENTER
DECOMMISSIONING PROJECT

Threshold Comparison Test Report - Soils

Run Thursday, June 19, 2003

Survey Unit Number: 99 Class: 1 Data Points: FMPC Grid Type: R Spacing: 0 m.

SURVEY UNIT TABLE

Borders				Surface Area	Remarks
N	S	E	W	Included (sq. m)	
600.	550.	50.0	10.0	2000	
Total				2000	

INITIALIZATION DATA

Measurement Types Selected: RG, BI

Date Range: All

*** Report does not include Remediated data points ***

Thresholds:

EMC: 3.0 DCGLw 1.0 Nuclides Tested: FMPC

SURVEY UNIT TEST STATUS

Test Performed	Status		Mtx	FMPC
Min/Max	Fail	Maximum Survey	S	1.8
Background	Fail	<u>Minimum</u>	S	<u>0.3</u>
DCGLw	Pass	Difference		1.5
DCGLavg	Pass			
EMC	Pass			
		Average Activity	0.0	FMPC
		Wilcoxon Rank Sum	Pass	

Sign Test for Paired Data: N/A

*** PRELIMINARY DATA ONLY. These data have not been fully reviewed. ***

TECHNICAL MEMORANDUM 02-09

September 5, 2003

Originator: A.H. Thatcher, CHP, Senior HP Scientist

Subject: Technical Support Document for KMTC Outdoor Final Status Survey

Revision: 2

ENDORSEMENT: This document contains the results of research and technical analysis which have been reviewed and approved for publication by the Technical Director, NEXTEP Environmental, Inc.

Harry J. Newman, CHP, Technical Director

Date

INTRODUCTION:

This document provides the technical basis for calculations for the Final Status Survey Plan for Outdoor Survey Units (FSSP). This document specifically addresses the following issues:

- Scan MDC for outdoor gamma measurements
- Investigation level for gamma scans
- MDC for direct beta measurements
- Scan MDC for beta measurements

Scan MDC for Outdoor Gamma Measurements

The required scan MDC for Outdoor Gamma Measurements should be 100% of the release limit converted to counts per minute for a typical 3 inch NaI detector in the **shielded** configuration. For the three radionuclide groups of interest, uranium, thorium, and radium, Ra-226 provides the most conservative combination of release limit and counts per unit concentration conversion factor. The conversion factor is obtained from the D Plan⁴³.

⁴³ Appendix E of D Plan: Derivation of Outdoor Scan Thresholds and MDCR for KMTC.

The calculation of required MDCR for gamma scans is as follows:

$$\text{Required MDCR} = [(3.5 \text{ pCi/g}) * (840 \text{ cpm/pCi/g})]$$

Where: 3.5 pCi/g = DCGL_w for Ra-226
810 cpm/pCi/g = Conversion factor

Required MDCR = 2940 cpm above background.

The calculation of actual instrument MDCR for the same instrument is fully explained in Appendix E of the D Plan. The calculated value given by the D Plan is:

MDCR = 1200 cpm

Investigation Level for Gamma Scans (Shielded NaI detector)

Using the same conversion factor and the DCGL_w for Ra-226, the release limit is

$$\text{DCGL}_w (\text{Ra 226}) = 2940 \text{ cpm}$$

The investigation threshold for shielded NaI scans is set to 2500 cpm. This is below the DCGL_w yet sufficiently above the MDCR.

MDC for Direct Beta Measurements

The required MDC for direct beta measurements is one half of the DCGL_w, or 6,250 βpm/100 cm². The formula for calculating the MDC for a Ludlum 43-89 detector is given by equation 1:

$$\text{MDC} = \frac{3 + 4.65\sqrt{B_r}}{\varepsilon * t * \frac{A_c}{100\text{cm}^2}}$$

Equation 1

Where:

B_r = Background count = 700 counts⁴⁴

ε = Instrument efficiency = 0.17⁴⁵

t = count time (minutes) = 1 m

A_c = effective probe area (cm²) = 110 cm²

⁴⁴ Average of open window counts for brick matrix from the KMTC database.

⁴⁵ Efficiency for Ludlum 2224 for brick matrix taken on 11/9/2000.

The resulting MDC for beta measurements is 670 βpm/100 cm² and is less than the required MDC.

Scan MDC for Beta Measurements

The required MDC for beta scan measurements should be equal to the DCGL_w, or 12,500 βpm/100 cm². The formula for calculating the Scan MDC¹ for the same detector is given by equation 2:

$$ScanMDC = \frac{1.38 \sqrt{\frac{B_r}{60} * \frac{60}{i}}}{\sqrt{p * \epsilon_i * \epsilon_s} * \frac{A_e}{100cm^2}}$$

Equation 2

Where:

B_r = Background count rate (cpm) = 700 cpm

i = probe observation interval (seconds)

p = surveyor efficiency = 0.5

ε_i = Instrument efficiency = 0.17

ε_s = Surface efficiency = 0.3⁴⁶

A_e = effective probe area (cm²) = 110 cm²

Given a worst case probe observation interval of 1 second (representing a first pass scan), the corresponding Scan MDC equals 7,130 βpm/100cm² and is significantly less than the required Scan MDC of 12,500 βpm/100 cm².

Conclusions and Recommendations

The table summarizes the information calculated above. In all cases, the calculated value is less than the required for a given measurement as shown in Table 1.

⁴⁶ NUREG 1570 Table 5.3 for a distributed source on sealed concrete.

Table 1
Summary of Calculations

Measurement of Interest	Calculated Value^a	Required Value^a
MDCR for Outdoor Gamma Scans with shielded 3" x ½" NaI	1,200 cpm	2,940 cpm
Investigation Threshold for Outdoor Gamma Scans with shielded 3" x ½" NaI	2,500 cpm	2,940 cpm
MDC for Direct Beta Measurements	670 βpm/100 cm ²	6,250 βpm/100 cm ² .
MDC for Beta Scans	7,130 βpm/100 cm ²	12,500 βpm/100 cm ² .

^a All values are net above background.

Appendix 6

Hot Spot Evaluation Protocol

HOT SPOT EVALUATION PROTOCOL

1. There are four general conditions where a result will require further investigation to determine the depth, extent and character of the radioactivity present. They are:
 - a. A NaI scan survey discovers an area which exceeds the specified threshold for the survey.
 - b. An isolated soil sample location exceeds the release criteria and is surrounded by points which do not.
 - c. Several adjacent soil samples (separated by a distance less than or equal to the grid spacing) exceed the release criteria.
 - d. Elevated measurements are obtained on contaminated buried piping or equipment.
2. SCANS. When a scan survey encounters readings in excess of the survey threshold:
 - a. Conduct an investigation with the scan instrument to determine the extent of the elevated area and mark the locations where the reading falls off to the threshold or below.
 - b. Record the X and Y location of the peak value.
 - c. Record the maximum reading at the same peak location.
 - d. Record the maximum distance across the affected area in meters.
 - e. For soil locations:
 - i.) Take three soil samples at the location of the peak scan reading (depths 0-0.15, 0.15-0.50, and 0.50-1.00 meters).
 - ii.) If the area of elevated activity is less than one meter across, no further action is required.
 - iii.) If the area is more extensive, take surface soil samples to cover the entire elevated area on a rectangular grid oriented NSEW with spacing appropriate to cover the area. The outer samples of the pattern should all be beyond the elevated area marked off by scans.
 - f. For concrete, either obtain a core sample for analysis or remediate the concrete surface to eliminate the hot spot. Document the readings before and after remediating
3. SINGLE SOIL SAMPLE. When soil analysis results produce a single, isolated data point which exceeds the release limit:
 - a. Calculate the EMC limit using the area rule by inscribing the largest possible circle around the hot spot which does not intersect the neighboring points.
 - b. If the hot spot is acceptable according to MARSSIM criteria:
 - i.) Resample the same location at the same three depths mentioned above to determine the vertical extent of the contamination.
 - ii.) Scan the immediate area surrounding the hot spot and respond to other localized maxima as described in Section 2.
 - c. If the hot spot exceeds EMC criteria:
 - i.) Resample the location at three depths down to 1 meter.

- ii.) Take surface samples to the N, S, E, and W of the hot spot at a distance appropriate to the situation but not greater than half the grid spacing.
 - iii.) Scan the area surrounding the hot spot out to the offset points and respond to other localized maxima as described in par. 2.
4. SEVERAL ADJACENT SOIL SAMPLES (separated by a distance less than or equal to the grid spacing) exceed the release criteria.
- a. Calculate the EMC limit using the area rule by inscribing the largest possible polygon around the elevated area which does not intersect the neighboring points which are below the release criteria.
 - b. If the hot spot is acceptable according to MARSSIM criteria:
 - i.) Resample at least one of the elevated locations at the same three depths mentioned above to determine the vertical extent of the contamination. Resample other locations to depth if needed to cover the area adequately.
 - ii.) Scan the entire elevated area surrounding the hot spot and respond to other localized maxima as described in par. 2.
 - c. If the hot spot exceeds EMC criteria:
 - i.) Resample at least one of the elevated locations at the same three depths mentioned above to determine the vertical extent of the contamination. Resample more to depth needed to cover the area adequately.
 - ii.) Cover the entire area of elevated activity with a grid of surface soil samples oriented NSEW and spaced to provide a resolution adequate to characterize the area with a reasonable number of samples. Ensure that the entire perimeter of the grid contains samples outside of the elevated area.
 - iii.) Scan the area surrounding the hot spot out to the offset points and respond to other localized maxima as described in par. 2.
5. CONTAMINATED BURIED PIPING.
- a. Discharge piping will be considered contaminated if:
 - v.) Direct β measurements on accessible internal surfaces exceed the DCGLw, or
 - vi.) Sludge taken from traps or access points and analyzed at the HP lab exceeds the DCGLw
 - vii.) Removable contamination measures more than 200 dpm/100cm² above background, or
 - viii.) Gamma scans/measurements on external surfaces exceed 2x background.
 - b. In the event that an elevated location is identified, the RSO will decide whether to:
 - i.) Perform isotopic analysis to determine the specific radionuclide contributors and derive a specific release limit for the buried piping, or
 - ii.) Remove the contaminated piping.

6. GENERAL CONSIDERATIONS

- 6.1. Elevated scan readings will be investigated as they are obtained. The maximum and average scan readings will be recorded for each area scanned on the FSS Scan Measurement Form (see Attachment A). When a reading above the threshold is obtained, the details discussed in Paragraph 2 will be recorded in the section titled "Hot Spot Information" on the same form. The soil samples which are taken to characterize the spot will be recorded on the Sample Collection Form as Bias (BI) samples. In the remarks note that these samples are hot spot characterization and, on the scan form, list the sample ID numbers for the soil samples collected as part of the investigation.
- 6.2. Elevated soil sample results will not normally be investigated in the field during the collection process since laboratory analysis is first required. Once the soil results are entered into the database, the analyst assigned to the survey unit will evaluate the hot spots in accordance with Paragraphs 3 and 4 above and prepare a Supplemental Data Request using the form supplied in Attachment B. The locations and depths of the required data points will be filled in by the analyst and iSued to operations for collection. This form will also serve as the data collection form for the soil samples. Special instructions will be included at the bottom. Any required scans that are conducted will be recorded on copies of Attachment C and attached to the Supplemental Data Request.
- 6.3. The guidelines given in Paragraphs 3 and 4 may be varied as necessary by the analyst when requesting remediation or supplemental data. (It may, for example, be advisable to remediate on the basis of an initial scan reading when the area is very small rather than expending time and effort collecting additional samples to further characterize the spot. The post remediation data points will cover all the necessary characterization after the spot has been removed.) Where depth data already exists for a hot-spot, the measurements need not be repeated.
- 6.4. After remediation of an affected area, supplemental data will be taken to obtain replacement data points and confirmation that the area is clean. Before backfilling or re-paving, data points (i.e soil samples) will be taken at the bottom of the remediated area. The regular grid points will be replaced as a minimum. All of these data points will be of type PR (post remediation) or PG (post remediation grid).
- 6.5. The RSO will determine whether NRC should be notified before authorizing any backfilling operations. Bias measurements will be collected on top of backfill material unless that material has already been characterized elsewhere.
- 6.6. Any survey unit that contains elevated measurements will have a scan survey re-performed over the entire survey unit after all necessary remediation has been performed to ensure that no other areas of elevated activity were missed.

6.7. When the data forms are submitted to Quality Assurance for processing, the Quality Control Coordinator will ensure that they are fully reviewed and will confirm that all the requested data were obtained and that no scan levels exist above thresholds which have not been processed in accordance with this protocol.
