Subject: Reactor fire prevention

12/24/03
RDB received
du

Proper systems are not in place at most reactors, and the utilities are relying instead on "operator actions," or plant workers manually operating the once-automated equipment by throwing a switch, pulling a circuit breaker, or turning a valve to shutdown the reactor in the event of fire--returning us to the pre-Browns Ferry days. To make matters worse, the NRC has now issued proposed new rules allowing this approach.

68FR66501

Please withdraw this approach in favor of a truly sound one.

Thank you.
