SOFTWARE RELEASE NOTICE

01. SRN Number: PA-SRN-024									
02. Project Titl PREFOR is commands h code portabi	Project No. 20-5702-723								
03. SRN Title: PREFOR									
04. Originator/	Requester: Thomas J. Ratchford		Date: 03/23/94						
05. Summary o	f Actions								
Release of new code admitted to CM System (R. Janetzke)									
	Release of modified code:								
	□ Enhancements made								
	Corrections made								
	Change of access code (R. Baca)								
	06. Persons Authorized Access								
	Name	RO/RW	A/C/D						
07. Element Ma	nager Approval:	Date:							
08. Remarks: A copy of the software package PREFOR, Ver. 1.1 was retained by the Principle Investigator for use in the CNWRA work center; therefore, a new release may not be necessary.

PREFOR Fortran Program Static and Dynamic Analysis

March 10, 1994

Earl S. Marwil John E. Tolli Scientific Computing Unit Idaho National Engineering Laboratory

1. Introduction

This analysis was performed on the Cray version of the software as provided by Southwest Research Institute (SwRI).

One sample problem was used along with the source code. The program was analyzed using the Craft (Cross Reference Analysis of Fortran) tool, FORWARN, the Fortran 77 analyzer, and PC-Metric. These tools provide static analysis, coverage analysis, and complexity analysis.

2. References

[1] N.H. Marshall and E.S. Marwil, <u>Cross Reference Analysis of Fortran (CRAFT)</u>, EG&G-CATT-9198, EG&G Idaho, Inc., July 1991.

[3] FORWARN User's Guide, Quibus Enterprises, Inc., July 1991.

[4] PC-Metric User's Guide, SET Laboratories, Inc., 1987.

3. Functions

The PREFOR program contains 7 Fortran routines.

There are no alternate entry points.

4. Common Block Irregularities

There are no common blocks in the PREFOR program.

5. Interface Irregularities

No Exceptions to report.

6. Local Variable Irregularities

Local variable exceptions are noted as follows:

Module	Variable	Exception
prefor writer	deckcd indent	Defined, Unused UNUSED
writer	lcmind	UNUSED
writer	lcomnt ltabin	UNUSED
writer	ltabrp	Undefined, Unused
writer	upcase	Undetined, Unused

7. Fortran Extensions

The following modules contain potential overlaps in character assignment statements:

```
prefor, tabfix, writer.
```

The following modules contain lowercase characters in their active Fortran:

```
prefor, cname, strail, tabfix, upcase, upstrg, writer.
```

8. Optimization

The following table summarizes the performance data gathered from execution of the sample problem. Only those routines exercised by the sample problem are shown (see "Coverage Analysis" for a list of routines not exercised by the sample problem, i.e., coverage = 0%). The table lists all program modules in descending order according to CPU time. To optimize code execution time, emphasis should be placed on those modules which appear highest in the listing.

In order to obtain meaningful statistics for performance evaluation, the program should execute for a reasonable amount of time. Note that the execution time for this sample problem is short (< 10 sec) and that the resulting statistics may therefore not accurately reflect program performance for more typical (possibly longer) runs.

The performance data show that a high percentage of the overall execution time (99.894%) is spent in the first 3 routines listed. This is due primarily to the following (applies to some or all of the 3 routines):

- 1) a low percentage of floating point operations which are performed in vector mode (%Vflops is small)
- 2) a high overhead factor for calls to the routines (IFact > 1)
- 3) a high rate of instruction buffer fetches (IBFR > 1).

A detailed optimization analysis effort should focus on these 3 areas.

PREFOR Analysis

ROUTINE NAME	Time	%ExTime	%AccumT	%Vflops	IFact	MC/MR	IBFR
WRITER PREFOR STRAIL CNAME UPCASE UPSTRG	5.802 1.976 0.741 0.007 0.002 0.001	68.034 23.175 8.685 0.081 0.019 0.006	68.034 91.209 99.894 99.975 99.994 100.000	0.00000 0.00000 0.00000 0.00000 0.00000 0.00000 0.00000	0.71 0.00 5.53 0.13 1.10 0.00	0.154 0.315 0.222 0.998 1.708 3.728	1.075 0.743 0.089 0.517 0.846 1.455

PERFORMANCE DATA FOR PREFOR

Key:

%AccumT •	accumulated percentage of total CPU time
%ExTime •	percentage of total CPU time
%Vflops	percentage of floating point operations due
	to vector floating point operations
IBFR •	Instruction Buffer Fetch Rate (megafetches/sec)
IFact •	Inline Factor (total calls to routine /
_	average time spent in routine for each call)
MC •	number of memory conflicts
MR •	number of memory references
Time '	= total CPU time (sec)

9. Coverage Analysis

A coverage analysis shows that the sample problem yielded a 58% segment coverage of PREFOR. Sample problems provided with simulation programs typically achieve only 35% to 50% coverage. A statement of software quality cannot be made for routines that have low coverage, i.e., large portions of the code are untested.

Note that 1 routine has 0% coverage. This routine is not tested with the supplied sample problem.

One routine achieves 20%-39% coverage, 2 routines achieve 60%-79% coverage, 2 routines achieve 85%-90% coverage, and 1 routine achieves 100% coverage.

Module	Number of	Number of	Percent
Name	Segments	Segments	Segment
	in module	Executed	Coverage
PREFOR	123	74	60.2
CNAME	29	26	89.7
STRAIL	7	6	85.7
TABFIX	16	0	0.0
UPCASE	4	4	100.0
UPSTRG	5	4	80.0
WRITER	41	16	39.0
Totals	225	130	57.8

	0.20	0.40	0.60	0.80	1.00
PREFOR CNAME STRAIL	 *****************************	-+ ******************************	-+ ****** ***********************	-+ ****************************	**
UPCASE UPSTRG	 ***********************************	 ********* **************************	 ********** ***********	 ********* ******* 	******
WITTEN	'	-+	-+	-+	-+i

	coverage = 0.	TABFIX	
0.20	<= coverage < 0.40	WRITER	
0.60	<= coverage < 0.80	PREFOR	UPSTRG
0.85	<= coverage < 0.90	CNAME	STRAIL
	coverage = 1.00	UPCASE	

Program coverage for this run =0.58

10. Complexity Analysis

Some key metrics are the number of executable statements (sloc), the number of non-blank comments (ncomt), McCabe's extended cyclomatic complexity (vg2), the number of branching statements (cgoto, ugoto, bIF, and IIF), and Halstead's predicted number of errors in (re)writing the code (bhat). Measures are normalized per 100 executable statements for ease of comparison and are listed in the table below.

The branching measures for this code (ugoto/sloc, lif/sloc) indicate moderately high values for some routines. This code may benefit from a restructuring effort aimed at reducing the number of unconditional GO TO and logical IF statements in these routines.

All routines show a good ratio of non-blank comments to source code.

McCabe's extended cyclomatic complexity (vg2), normalized per 100 lines of source code, indicates high values. Generally, the routines with the highest complexity are those most likely to have defects. As a guideline, normalized measures of 15 or greater should be considered complex. A software maintenance program should focus on those routines with the highest measures.

PREFOR Analysis
