 Mindy,
 I think we have to refrain from going beyond the question of information presently accessible via public WEB access. We know, for example, that people have ADAMS access to publicly available correspondence. To search the external ADAMS database without clear guidance and legal bases for withdrawing/withholding info in accordance with 2.790 raises more issues than we are prepared to address on a short turnaround basis.
 David

 We have identified them, even though they are not located on the web (the PIBs apparently took much of their info from the FSARs). Obviously, this would be more extensive in terms of pulling back docs from the PDR, and other locations... NTIS, Federal Depository and LPDRs (or local libraries.) Dave, what are your thoughts on this?

 Mindy, most facility SARs for sites are very descriptive in location, site maps etc. Any consideration for pulling these from the PDR and other locations? Bill

 1. the Sealed Source and Device registry contains design details about sources and devices and is stand alone document on vulnerabilities of these devices. Remember this registry is also used extensively by agreement states.

2. PRM 73-10 "Nevada petition" about possible terrorist attacks related to spent fuel transportation submitted June 22, -1999

areas under review

We are evaluating issues related to license files and don't believe that they reach the threshold of stand alone documents such as PIB that Dave Matthews discussed. These files contain possession limits and contingency plans. Any thoughts?

What are we doing with incident reports and events databases as well as inspection reports. We believe they are beyond the scope of this sort. Agreed?
