Subject: NUREG/CR-4840 and NUREG/CR-6365

*release*

Linda and Tom

NUREG/CR-4840-Procedures for the External Event Core Damage Frequency Analyses for NUREG-1150, this document is contained generic scenarios and components without the detailed information in NUREG-1150. It is a technical tool to setup procedures for analyses. Tom told me all seven volumes of NUREG-1150 have been pulled off from PDR. Without NUREG-1150 information, NUREG-4840 will be O.K. to release.

NUREG/CR-6365-Steam Generator Tube Failures, it is a technical evaluation on steam generator tubing failures and its impact to plant safety. It doesn't contain any site specific information. Although the topics in this NUREG are covered PWR (US), CANDU (Canadian), and VVER (Russian), there are generic issues in common. It is o.k. for the release.
