Subject: RE: Safeguards Information

Patrick,

The information on NRC's website is already a matter of public record; however, I will pass your concerns on to NRC's safeguards staff. Take good care.

Rosetta, My concern is more with the media than the NRC. It appears to me that some of the information in recent news reports contains information that would be classified as safeguards on the site level. The NRC web page also gives enough information about plant schematics for a person knowledgeable of engineering to develop a list of target sets in order to hinder safe shut down. For example, link to: <http://www.nrc.gov/AEOD/pib/reactors/286/286toc.html>

Thank you, Patrick for your email and for sharing your concerns with NRC.

I'm not aware that NRC has highlighted nuclear plant and materials safeguards vulnerabilities. I do know, however, that NRC takes the protection of public health and safety very seriously and that we and our licensees remain at the highest level of security since the events of 9/11.

Why is the government allowing the proliferation of information about nuclear reactor safeguards, specifically the vulnerability of spent fuel pools and fuel storage buildings, as well as detailed information about containment structures? This is very irresponsible in light of what has happened, and the real threat posed to our nation's nuclear facilities.
