Subject: Annual Radiological Environmental Operating Report - 2003 Waterford Steam Electric Station, Unit 3 (Waterford 3) Docket No. 50-382 License No. NPF-38

Dear Sir or Madam:

Attached is the Annual Radiological Environmental Operating Report for the period of January 1 through December 31, 2003. This report is submitted pursuant to the requirements of Waterford 3 Technical Specification Section 6.9.1.7.

If there are any questions please contact T.M. Manzella at (504) 739-6882.

There are no new commitments contained in this submittal.

Sincerely, yandam Un

G. Sen Licensing Manager

Summary

The Annual Radiological Environmental Operating Report presents data obtained through analyses of environmental samples collected for Waterford 3's (W3) Radiological Environmental Monitoring Program (REMP) for the period January 1 through December 31, 2003. This report fulfills the requirements of W3 Technical Specification 6.9.1.7.

During 2003, gross beta radioactivity was detected in air and drinking water/surface water locations. Results obtained at the indicator locations were similar to those obtained at the control location. Therefore, levels continue to remain at background.

Tritium was detected in one sample at location SWK-1. Tritium was routinely released as measured in effluent sampling analysis via this pathway until March 2003. Tritium is no longer released via this pathway.

Radiological Environmental Monitoring Program

W3 established the REMP prior to the station becoming operational (1985) to provide data on background radiation and radioactivity normally present in the area. W3 has continued to monitor the environment by sampling air, water, sediment, milk, fish and broadleaf vegetation, as well as measuring radiation directly.

The REMP includes sampling indicator and control locations within a 40-mile radius of the plant. The REMP utilizes indicator locations near the site to show any increases or buildup of radioactivity that might occur due to station operation, and control locations farther away from the site to indicate the presence of only naturally occurring radioactivity. W3 compares indicator results with control, preoperational, and previous years operational results to assess any impact W3 might have on the surrounding environment.

In 2003, W3 collected environmental samples for radiological analysis. Based on the comparison results of indicator locations with control locations and previous studies, it was concluded that overall W3 operations had no significant impact on plant environs with the exception of surface water tritium where a direct correlation from plant operations exists below the reporting level. The review of 2003 data, in many cases, showed undetectable radiation levels in the environment and near background level in significant pathways associated with W3.

Harmful Effects or Irreversible Damage

The REMP did not detect any harmful effects or evidence of irreversible damage in 2003. Therefore, no analysis or planned course of action to alleviate problems was necessary.

Reporting Levels

W3's review indicates that no samples equaled or exceeded reporting levels for radioactivity concentration in environmental samples, as outlined in Technical Requirements Manual (TRM) Table 3.12-2 when averaged over any calendar quarter, due to W3 effluents. Therefore, 2003 results did not trigger any Radiological Monitoring Program Special Reports.

Radioactivity Not Attributable to W3

The W3 REMP detected radioactivity attributable to other sources twice. These include the 25th Chinese nuclear test explosion in 1980, and the radioactivity plume release due to reactor core degradation at the Chernobyl Nuclear Power Plant in 1986.

Comparison to State Program

W3 compared REMP data to the monitoring program of the Environmental Radiological Laboratory – Department of Environmental Quality Laboratory Services Division (ERL-DEQLSD). The ERL-DEQLSD and the W3 REMP entail similar radiological environmental monitoring program requirements. Both programs have obtained similar results over previous years.

Sample Deviations

Milk Samples

Four milk samples were unavailable from indicator location MKQ-5 due to owner selling cows. Four milk samples were unavailable from indicator location MKE-3 due to cows not producing enough milk. With the absence of milk samples at these locations, broadleaf vegetation sampling was performed as required by TRM Table 3.12-1.

Air Samples

The air sample locations listed below failed to meet the requirement for sample continuity. As described in footnote (1) of TRM Table 3.12-1, deviations are permitted from the required sampling schedule due to malfunction of sampling equipment and other legitimate reasons.

Location	Sample period	Explanation of Deviation
APE-30	12/30/02 – 01/14/03	GFI breaker trip
APF-1	04/21/03 - 05/05/03	Failed cal check and flow rate
APE-30	04/21/03 – 05/05/03	Loss of power
APQ-1	08/11/03 – 08/25/03	Sample pump tripped
APE-30	12/01/03 — 12/15/03	Failed cal check and flow rate

Water Samples

The drinking/surface water sample location listed below failed to meet the requirement for sample continuity. However, required LLDs were achieved. As described in footnote (1) of TRM Table 3.12-1, deviations are permitted from the required sampling schedule due to malfunction of sampling equipment and other legitimate reasons.

Location	Sample period	Explanation of Deviation
SWK-1	02/25/03 — 03/24/03	Low water in canal
SWK-1	05/19/03 — 06/16/03	Leak in hose
SWK-1	10/06/03 — 11/03/03	Replaced power converter

TLDs

Station Q-1 was missing one TLD during the first quarter. The remaining TLD was left in place and read at the end of the quarter. Station B-4 TLDs were missing during the fourth quarter TLD inspection. Another set of TLDs were placed at this location and read at the end of the quarter.

Missed Samples

TLDs located at station G-4 were missing at the time of the third quarter TLD exchange. TLDs located at station H-8 were missing at the time of the fourth quarter exchange.

• Required Lower Limit of Detection (LLD) Values

LLDs for Ba-140 for milk and water samples were not met for quarters 2, 3 and 4 of 2003. Background fluctuation in samples rendered these LLDs unachieveable. However, it should be recognized that the LLD, <u>a priori</u> limit, representing the capability of a measurement system, did achieve the required LLDs. All other LLDs during this reporting period were within the acceptable limits required by the W3 TRM.

Unavailable Results

W3 received analytical results in adequate time for inclusion in this report. In addition, W3's review identified no missing results.

Program Modifications

The following changes were made to the TRM in accordance with NUREG 1301/Branch Technical Position during 2003:

- The reporting level for tritium was changed from 20,000 pCi/l to 30,000 pCi/l if no drinking water pathway exists.
- The reporting level for I-131 in water was changed from 2 pCi/l to 20 pCi/l if no drinking water pathway exists.
- The LLD for tritium was changed from 2,000 pCi/l to 3,000 pCi/l if no drinking water pathway exists.
- The LLD for I-131 in water was changed from 1 pCi/l to 15 pCi/l if no drinking water pathway exists.
- The LLD for Zr-95 was changed from 30 pCi/l to 15 pCi/l.
- The LLD for Ba-140 was changed from 60 pCi/l in water and milk to 15 pCi/l in water and milk.

Copies of the affected TRM tables are included in this report in Attachment 3.

Attachments

Attachment 1 contains results of air, TLD, water, sediment, milk, fish and broadleaf vegetation collected in 2003. TLDs were analyzed by Waterford-3 Dosimetry. All remaining samples were analyzed by the River Bend (RBS) Environmental Laboratory. Attachment 1 also contains River Bend's participation in the interlaboratory comparison program during 2003.

Attachment 2 contains statistical comparisons of:

- TLD measurements from stations grouped by distance
- TLD radiation dose to historical data by location
- Gross beta activity measurements on air particulate filters
- Gross beta activity measurements in surface/drinking water samples

Attachment 3 contains 2003 revised TRM tables.

1.0 Introduction

1.1 Radiological Environmental Monitoring Program

W3 established the REMP to ensure that plant operating controls properly function to minimize any associated radiation endangerment to human health or the environment. The REMP is designed for:

- Analyzing important pathways for anticipated types and quantities of radionuclides released into the environment.
- Considering the possibility of a buildup of long-lived radionuclides in the environment and identifying physical and biological accumulations that may contribute to human exposures.
- Considering the potential radiation exposure to plant and animal life in the environment surrounding W3.
- Correlating levels of radiation and radioactivity in the environment with radioactive releases from station operation.

1.2 Pathways Monitored

The airborne, direct radiation, waterborne and ingestion pathways are monitored as required by W3 TRM Table 3.12-1. A description of the W3 REMP utilized to monitor the exposure pathways is described in Table 1.1 and shown in Figures 1-1, 1-2 and 1-3.

Section 2.0 of this report provides a discussion of 2003 sampling results with Section 3.0 providing a summary of results for the monitored exposure pathways.

1.3 Land Use Census

W3 conducts a land use census biannually, as required by Section 3.12.2 of the TRM. The purpose of this census is to identify changes in uses of land within five miles of W3 that would require modifications to the REMP and the Offsite Dose Calculation Manual (ODCM). The most important criteria during this census are to determine the location in each sector of the nearest:

- 1) Residence
- 2) Animal milked for human consumption
- 3) Garden of greater than 50 m² (500 ft²) producing broadleaf vegetation.

W3 conducts the land use census by:

- Field surveys in each meteorological sector out to five miles in order to confirm:
 - > Nearest permanent residence
 - Nearest garden and approximate size
 - Nearest beef cow
 - Nearest food product
 - > Nearest milking animal.
- Identifying locations on maps, measuring distances to W3 and recording results on data sheets.
- Comparing current census results to previous results.

FIGURE 1-2

FIGURE 1-3

2.0 Interpretation and Trends of Results

2.1 Air Particulate and Radioiodine Sample Results

Samples of airborne particulate and radioiodine were collected at four indicator locations and one control location and analyzed for gross beta radionuclides, lodine-131 and gamma radionuclides (quarterly air particulate filter composites only). W3 did not detect any gamma radionuclides in the quarterly air particulate composites or lodine-131 in the radioiodine cartridges during the reporting period, as has been the case in previous years. Indicator gross beta air particulate results for 2003 were similar to those background levels obtained in previous years of the operational REMP and well below preoperational levels as seen below. Results are reported as annual average pCi/m³.

Monitoring Period	<u>Result</u>
Preoperational	0.080
1983 – 2002	0.019
2003	0.020

Table 3.1, which includes gross beta concentrations for 2003, provides a comparison of the indicator and control means further emphasizes that the airborne pathway continues to remain at background levels. In addition, as shown in Attachment 2, the standard "t" test was used to compare average gross beta activity from each indicator station to the average gross beta activity at the control station. The results from this test show the average activity detected at all indicator stations is statistically the same as the average activity detected at the control station. Therefore, W3 concluded that plant operations had no significant impact on this pathway during 2003.

2.2 Thermoluminescent Dosimetry Sample Results

The average exposure rates during 2003 are consistent with those from the preoperational program and the previous five years of operation as seen in Figure 2-1. In particular, the preoperational survey indicates that exposure rates ranged between 11 and 33 mrem/standard quarter with an average of 20 mrem/standard quarter. The range during the previous five years of operation was 9 to 15 mrem/standard quarter with an average exposure rate of 12 mrem/standard quarter.

A comparison of the indicator results to the control results, as seen in Table 3.1, shows that the average indicator is slightly higher than that of the control. As shown in Attachment 1, Table 2.1, several indicator locations are higher than the control by a few mrem with a maximum difference of five mrem at one location (G-2).

As shown in Attachment 2, Table 2.1, the standard "t" test was used to compare average exposure rates for TLD stations located in groups 0-2 miles and 2-5 miles from the plant to those > 5 miles. The results indicate that the average exposure rates 0-2 miles and 2-5 miles from the plant are statistically the same as those > 5 miles.

The differences between indicator locations and the control, and TLD stations grouped by distance from the plant are expected due to a variety of factors not related to W3 plant operations that can affect background radiation in the vicinity of each TLD station. Direct radiation measurements at each TLD station have remained statistically the same in 2003 as previous years of operation as evidenced on Attachment 2, Table 2.2. In addition, Radiological Gaseous Effluents for 2003 were only a small fraction of the limits as is typical in previous years of operation and are not expected to have any impact on environmental TLD measurements.

2.3 Water Sample Results

Analytical results for 2003 drinking/surface water samples were similar to those reported in previous years.

Drinking/Surface Water

Drinking water samples also serve as surface water samples for W3. Therefore, monthly and quarterly gamma spectroscopy and tritium analyses of drinking water also satisfy the surface water sampling requirement.

Composite drinking/surface water samples were collected from two indicator and one control location and analyzed for lodine-131, gamma radionuclides and tritium. Results indicate that all measurements were below the calculated LLDs.

Although gross beta was detected in the drinking/surface water samples, results for the indicator locations were below previous operational and preoperational years as seen below. Results are reported as annual average pCi/l.

Monitoring Period	<u>Result</u>
Preoperational	7.0
1983 – 2002	5.2
2003	3.0

Table 3.1, which includes gross beta concentrations for 2003, provides a comparison of the indicator and control means shows that the waterborne pathway continues to remain at background levels. In addition, as shown in Attachment 2, the standard "t" test was used to compare average gross beta activity from each indicator station to the average gross beta activity from the control station. The results from this test show average activity detected at all indicator stations is statistically the same as the average activity detected at the control station. Therefore, W3 concluded that plant operations had no significant impact on this pathway during 2003.

Surface Water

Surface water samples were collected from one indicator location and analyzed for gamma radionuclides and tritium. W3 did not detect any gamma radionuclides in surface water samples during the reporting period.

Tritium concentrations detected in 2003 are higher than those from the preoperational program as seen below. Results are reported as annual average pCi/l.

Monitoring Period	<u>Result</u>
Preoperational	121
1983 – 2002	1064
2003	21673

Tritium is expected due to liquid effluent releases from the Turbine Building Industrial Waste Sump (TBIWS) normally being directed to the 40 Arpent canal where samples are collected. Water from this pathway is typically discharged at a rate of approximately 20,000 gallons per day total with tritium concentration ranging from 1.81E-6 uCi/ml to 1.56E-4 uCi/ml. The plant effluent is diluted by adjoining canals and rain, which can vary significantly depending on weather conditions, prior to reaching the sample location. As a result, samples collected after periods of heavy rain can indicate concentrations below detection levels, while those collected during dry periods have the potential to approach concentrations discharged directly from the plant via the TBIWS. Minor primary to secondary leakage has resulted in a rising trend in TBIWS tritium levels. This was identified in the 4th quarter of 2002. Actions were taken to address the rise to prevent the approach of the reporting limit for SWK-1. Tritium is no longer released via this pathway as of March 2003. Modification was installed to divert this pathway to circ water.

2.4 Sediment Sample Results

Sediment samples were collected from two indicator locations and one control location and analyzed for gamma radionuclides. Results indicate that all measurements were below the calculated LLDs. Therefore, W3 concluded that plant operations had no significant impact on this pathway during 2003.

2.5 Milk Sample Results

Milk samples were collected from one indicator and one control location and analyzed for lodine-131 and gamma radionuclides. Results indicate that all measurements were below the calculated LLDs. Therefore, W3 concluded that plant operations had no significant impact on this pathway during 2003.

2.6 Fish Sample Results

Fish samples were collected from two indicator and one control location and analyzed for gamma radionuclides. Results indicate that all measurements were below the calculated LLDs. Therefore, W3 concluded that plant operations had no significant impact on this pathway during 2003.

2.7 Broadleaf Vegetation Sample Results

Broadleaf vegetation samples were collected from two indicator and one control location and analyzed for lodine-131 and gamma radionuclides. Results indicate that all measurements were below the calculated LLDs. Therefore, W3 concluded that plant operations had no significant impact on this pathway during 2003.

2.8 Land Use Census Results

In compliance with the Waterford 3 ODCM and TRM, the land use census was conducted on September 24, September 30 and October 8, 2002. The nearest residence, garden, beef cow, food product and milk animal in each sector within a five mile radius of the plant was located by visual inspection and verbal inquiry.

While garden and food product locations remained unchanged for 2002, one location of goats (sector E) and one location of milk cows (sector Q) were removed. One new resident location (sector Q), one new milk cow location (sector E) and one new beef cow location (sector E) was identified in 2002. Based upon the locations identified in this survey, the locations identified in previous surveys and the locations currently being used to calculate dose commitments from liquid and gaseous effluents released from W3, no REMP sampling location changes are necessary. Results of the 2002 biannual census are shown in Table 2.1.

2.9 Interlaboratory Comparison Results

The River Bend Station Environmental Laboratory analyzed interlaboratory comparison samples for W3 to fulfill the requirements of Section 5.7.2 of the ODCM. Attachment 1 contains these results. For the sample result outside the acceptable control limit, W3 and RBS's review indicated no impact on previously reported data. Attachment 1 also provides additional discussion regarding the sample result outside the acceptable control limit.

3.0 Radiological Environmental Monitoring Program Summary

3.1 2003 Program Results Summary

Table 3.1 summarizes the 2003 REMP results. W3 did not use values reported as less than the lower limit of detection (<LLD) when determining ranges and means for indicator and control locations.

^a GB = Gross beta; I-131 = Iodine-131; H-3 = Tritium; GS = Gamma scan.

b LLD = required lower limit of detection based on Waterford 3 TRM.

c Mean and range based upon detectable measurements only. Fraction of detectable measurements at specified locations is indicated in parenthesis (F).

d Locations are specified (1) by name and (2) degrees relative to reactor site.

• Non-routine results are those which exceed ten times the control station value. If no control station value is available, the result is considered non-routine if it exceeds ten times the preoperational value for the location.

f LLD is not defined in Waterford 3 TRM.

NOTES:

- (a) The "known" values are listed with a range reflecting control (3 sigma) limits.
 (b) The normalized deviation from the "known" value is computed from the deviation and the standard error of the mean; ±2.000 is the warning limit and ±3.000 is the control limit. This is a measure of accuracy of the analytical methods.
- (c) The normalized range is computed from the mean range, the control limit, and the standard error of the range;
 +2.000 is the warning limit and +3.000 is the control limit. This is a measure of precision of the analytical (d) The results reported were out of the control limits.

Interlaboratory Comparison Program Exceptions

There was one result outside the control limits for accuracy in the 2003 cross check program participation studies. This result was in a gamma isotopic analysis of a water sample.

The result outside the control limits for accuracy was in the analysis of the nuclide I-131 in sample study E3755-125 of 6/12/2003. RBS normalized-deviation for the analysis was +3.06 with control limits of ± 3.00 . This high bias result is considered conservative and is considered as having no impact on past results of the program. I-131 results were all within control limits in other cross check samples for the year 2003.

Statistical Analyses

• Calculation of the Mean and Standard Deviation

The mean and standard deviation for different groups of analyses are calculated using the following equations:

$$\overline{X} = \sum_{i=1}^{n} \frac{X_i}{n}$$

and

$$S = \left(\frac{\sum_{i=1}^{n} (X_i - \overline{X})^2}{(n-1)}\right)^{0.5}$$

where:

X = mean of sample population,

S = standard deviation of sample population,

n = number of samples in sample population, and

 X_i = value of the i'th sample.

Comparing Two Sample Population Means

The means of two sample populations are compared for statistical difference using the standard "t" test. The use of the test requires the assumption that the data within the populations are normally distributed and that the true standard deviations of the mean are equal for both populations. The standard "t" test tests the hypothesis that the true means of both populations are equal. The "t" value can be calculated from the equation below (obtained from the <u>CRC Standard Mathematical Tables</u>, 26th Edition (1981)):

$$t = \frac{\overline{X} - \overline{Y}}{\left(\frac{(n_x - 1)s_x^2 + (n_y - 1)s_y^2}{n_x + n_y - 2}\right)^{0.5} \left(\frac{1}{n_x} + \frac{1}{n_y}\right)^{0.5}}$$

where:

t = calculated "t" value,

- X = mean of first data set,
- Y = mean of second data set,
- η_x = number of variables in first data set,

 S_x = standard deviation of first data set,

- $\eta_{\rm v}$ = number of variables in second data set, and
- S_{y} = standard deviation of second data set.
- The calculated "t" value is used to test the hypothesis that the true mean of the first population (m $_x$) is equal to the true mean of the second population (m $_y$) assuming that the true standard deviation of both populations are equal

 $(m_x = m_y)$. The calculated "t" value is compared to a tabular "t" value such that:

- a if $t > t \mu_{n}$ then reject the hypothesis when $m_x > m_y$,
- b. if $t < -t \mu_{n}$ then reject the hypothesis when $m_x < m_y$,
- c. if t > t $\mu_{/2,n}$ then reject the hypothesis when m $_x = m_y$,

where t $\mu_{2,n}$ and t μ_{n} are the tabular "t" values, with a preselected error (5%), confidence level (1 - μ) or (1- $\mu/2$), and degrees of freedom $n = n_x + n_y - 2$. Tabular values of the "t" were obtained from the <u>CRC</u> <u>Standard Mathematical Tables</u>, 26th Edition (1981).
