Document_Title: Good Practices for Implementing Human Reliability Analysis (HRA)

Comments: Comments:

1. Section 5.3.3.6: The good practice suggests that the total combined probability of all HFES in the same accident sequence not be lower than 1E-05. HFES associated with initiating event fault trees should not be included in this combination due to their general lack of correlation with other post-event human actions.
2. Section 5.4.3.1: The definition of recovery action is not clear and footnote #1 on page 53 is missing. Need to clear indicate difference between post-initiator human failures and recovery actions, and how this difference impacts the quantification. Recommend that recovery actions be defined as alarm driven actions and post-initiator actions be defined as procedure driven actions (not driven by alarm).
