Mr. William Brach, Director
Spent-Fuel Project Office
Office of Nuclear Material Safety and Safeguards (NMSS)
U.S. Nuclear Regulatory Commission
Washington, DC 20555

Dear Mr. Brach:

In accordance with the Memorandum of Understanding between our Agencies, I request that you review the attached Application for Exemption and supplemental material and provide your agency's recommendation to the DOT whether this application should be a candidate for a DOT exemption.

The applicant, the U.S. Department of Energy, is requesting an exemption from 49 CFR § 173.453(d) fissile materials - exception requirements to ship low enriched uranium oxide (UO₃), exceeding a maximum of 1 percent of uranium-235 by weight, in 55-gallon drums (227 total) qualified as IP-1 packages, by highway, from the Savannah River Site to the Nevada Test Site, for disposal.

To assist you in your review, I am providing two copies of the Application for Exemption and supplemental material as well as the following potential issues identified by us pertaining to the request.

- 1) Contradictory information is provided on the total number of drums (380, 381, and 382) originally generated during the campaign.
- 2) Whether there is no Type A fissile packaging that could be used to achieve full regulatory compliance.
- 3) The request for exemption from the fissile material - exception requirement in 49 CFR 173.453(d) that does not address all requirements of the subject paragraph, such as plutonium, uranium-233, beryllium, graphite, or hydrogenous material enriched in deuterium content.

Tracking Number: 2004100032

NMSS01

Letter

NOV 23 2004

- 4) The enclosed Safety Evaluation Report that references transport index rather than criticality safety index to demonstrate compliance with 10 CFR § 71.59(b).
- 5) Whether the applicant is proposing to ship exclusive use.

Since the applicant desires to use this exemption in upcoming shipments, we request you provide an estimate of the time needed to complete your review. If you have any questions or need any additional information, please contact Jim Williams at (202) 366-6177.

Sincerely,

Delmer F. Billings

Dear Associate Administrator:

The U.S. Department of Energy requests an exemption from the requirements of 49 CFR 173.453(d) to permit the one-time, one-way shipment of certain IP-1 drums containing low-enriched uranium oxide from the Savannah River Site to the Nevada Test Site **by highway**. Full details of our exemption request are included in the enclosed documents. Also enclosed is a copy of our Safety Evaluation Report detailing our independent review and evaluation of the Savannah River Site contractor's criticality safety analysis.

If you have any questions, please call Dr. James Shuler at 301-903-5513.

Dear Associate Administrator:

The U.S. Department of Energy requests an exemption from the requirements of 49 CFR 173.453(d) to permit the one-time, one-way shipment of certain IP-1 drums containing low-enriched uranium oxide from the Savannah River Site (SRS) to the Nevada Test Site. Full details of our exemption request are included in the enclosed documents. Also enclosed is a copy of our Safety Evaluation Report detailing our independent review and evaluation of the SRS contractor's criticality safety analysis.

If you have any questions, please call Dr. James Shuler at 301-903-5513.

memorandum

DATE: AUG 05 2004
REPLY TO:
ATTN OF: NMPD (Dawn Gillas, (803) 208-3976)

SUBJECT: Request for Exemption from the Department of Transportation (DOT) Requirement for Low Enriched Uranium (LEU) Shipments

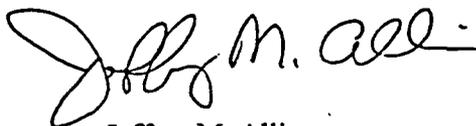

TO: Paul M. Golan, Acting Assistant Secretary for Environmental Management (EM-1), HQ

The Savannah River Site (SRS) has the opportunity to dispose of 382 drums of low enriched uranium oxide (LEUO) as low level waste at the Nevada Test Site. When determining the packaging requirements for this material, SRS determined that 227 drums contain uranium enriched to a level slightly higher than is allowed by DOT for material to be shipped in an Industrial Package. The 49 CFR 173.453 describes fissile material exceptions such that materials meeting these requirements are not required to be shipped in "fissile packages." Paragraph (c) of this section applies to LEU with a maximum enrichment of one percent. The 227 drums slightly exceed this limit (including uncertainty) to a maximum of 1.084 percent, which would require these drums to be shipped in Type A Fissile packages. No such packages are available for this material form and development of a compliant package would be a multi-million dollar, multi-year project. Allowing the exemption would allow all of the drums to be dispositioned within nine months of granting the exemption and at a cost of less than \$100K.

The attached Exemption Request follows all of the requirements of 49 CFR 107.105, Application for Exemption, and details the reasons SRS feels this is a safe and appropriate action. To summarize the major reasons: 1) this is a one-way, one-time shipment of a very limited amount of material, 2) the criticality analysis shows equivalent safety by limiting the amount of material in each shipment, and 3) the cost and time necessary to develop and implement an approved package is prohibitive. The only other option that is currently available is continued storage for an indefinite period, which is contrary to risk-managed accelerated cleanup.

We have communicated with your staff regarding the exemption request and have provided them with an advance copy of the nuclear criticality safety evaluation to support the justification. Please forward this request to the appropriate DOT office for approval. Two original request packages are attached since two originals are required to be submitted to DOT.

If you have any questions, please contact me or have your staff contact Dawn Gillas at (803) 208-3976.

REQUEST FOR DEPARTMENT OF TRANSPORTATION EXEMPTION

Savannah River Site (SRS) currently has an inventory of legacy low enriched uranium oxide (LEUO) packaged in 382 55-gallon galvanized steel (Excepted) drums. The material has been stored inside an SRS facility since 1982 and is destined for shipment to the Nevada Test Site (one-time, campaign) for permanent disposal. The LEUO material in 155 of the drums meets the 173.403 definition of LSA-II solid material with the 173.453(d) fissile materials exception (uranium-235 enrichment < 1%). The LEUO material in the remaining 227 drums has uranium-235 enrichments slightly above 1%; with the maximum being 1.084%. For each planned conveyance, a listing of the 227 drum ID numbers, corresponding uranium-235 enrichment, and UO₂ weight is given in Attachment 1. The uranium-235 enrichment values were determined by mass spectrometer measurements with an uncertainty of +/- 1.3% (or approximately 1.000 +/- 0.013) as described in Attachment 2.

SRS seeks relief from the 173.453(d) requirement that limits uranium-235 enrichment to a maximum of 1%; specifically, "Uranium enriched in U-235 to a maximum of 1 percent by weight" as stated in 49 CFR effective October 1, 2004. The exemption is sought so that the fissile materials exemption will still apply to shipments of a total of 227 drums containing low enriched uranium oxide (LEUO). The shipments will be transported by highway.

The consequence of not meeting the fissile materials exception for the 227 drums is that the packaging category increases from excepted package to Type A fissile. There is a limited number of approved Type A fissile package designs for materials other than non-irradiated fuel in the United States. WSRC reviewed certificates for the Type A fissile packages listed on RAMPAC and did not identify any viable options that could be readily used. WSRC also explored adding/mixing depleted uranium with the LEUO contents to reduce the enrichment below 1%. WSRC determined that mixing operations involve considerable radiological risk and costs; and the capability does not currently exist to carry out the mixing. Since alternative packagings were not identified and the capability to modify contents does not exist at SRS, WSRC has concluded that seeking a DOT exemption is the only viable option.

APPL

Proposed Alternative: WSRC will strictly limit the total content weight and corresponding number of drums in each conveyance so that criticality safety is ensured for a worst case accident scenario (total breach of drums where LEUO forms an optimally moderated sphere that is water reflected). Transport safety under normal conditions of transport is also demonstrated. The drums will be shipped from SRS to NTS for permanent disposal. When the 227 drums have been transported, there will be no additional shipments.

The LEUO (UO₂) is an oxide that is stable well above the 800°C fire conditions of 10 CFR 71 [see Attachment 3]. A criticality evaluation of the safe spherical mass of LEUO was completed and is provided in Attachment 4. The criticality evaluation considered a k_{eff} value of 0.948 and calculates $k_{eff} + 2\sigma < k_{crit}$. For this evaluation, σ is defined as the statistical uncertainty associated with the MCNP 4C calculations. Based on the evaluation, the weight of LEUO determined to be safe under any conditions was determined to be 7.5 MT or 16,534 lbs for an enrichment of 1.05% and 5.25 MT or 11,574 lbs for an enrichment of 1.084%. The content weight in each conveyance will be limited to these conservative weight limits. Normal condition of transportation safety was demonstrated by considering an array of undamaged packages in accordance with 10 CFR 71.59. This criticality evaluation is provided in Attachment 6. The conveyance loading plans for all of the drums are given in Attachment 1.

In Attachment 1, the drums listed in Group 1 loading plans were selected with U-235 wt% enrichments ranging from 0.987% to 1.036%. This considers the 1.3% uncertainty in the enrichment measurements (i.e. $1.00 - 0.013 = 0.987$ and $1.05 - 0.014 = 1.036$). The Group 2 loading plans were selected with enrichments from 1.037% to 1.084%.

The exemption is sought for the period of time required to ship the 227 drums from SRS to NTS. WSRC estimates the shipments will be completed within 9 months from the time the exemption is granted.

The basis for the exemption request is that the number of excepted LEUO drums with uranium-235 enrichments greater than 0.987% (1% minus uncertainty) will be limited on each conveyance to ensure sub-criticality. The safe spherical mass criticality evaluation provided in Attachment 4 establishes worst case, conservative, mass limits for the allowed LEUO. The Attachment 4 mass limits are used to limit the number of drums in each conveyance. If the drums were subjected to the hypothetical accident conditions in 10 CFR 71 (drop and fire), it is anticipated that the drums would fail and the contents would be distributed. Since the safe spherical mass evaluation considers a worst case geometry, any conceivable accident configuration should be bounded. In reality the forces in an accident (30 foot drop onto unyielding surface) will tend to distribute the material (not form it into a sphere) making it safer from a criticality perspective. The 800°C fire has no adverse effect on the LEUO material. Normal condition transport containment and shielding are provided by the excepted packaging (per 173.427(b)(4)) for LSA-II material meeting the fissile materials exception of 173.453(d). Criticality safety under normal conditions of transport is demonstrated in Attachment 6 which considers an array of packages in accordance with 10 CFR 71.59 (a)(1). The calculations in Attachment 6 demonstrate that more than five times the number of packages planned for shipment in each conveyance is safe. At the completion of the shipping campaign, WSRC will have no further shipments of this LEUO material.

The LEUO material meets the definition of LSA-II. Pending the approval of this exemption request, the shipping description of will be "RQ, Radioactive Material Low Specific Activity (LSA-II), 7, UN3321".

THE WSRC TEAM

Westinghouse Savannah River Company LLC • Bechtel Savannah River, Inc. • BNFL Savannah River Corporation
BWXT Savannah River Company • CH2 Savannah River Company • Polestar Savannah River Company

The packaging is an excepted drum-type packaging meeting the requirements of 49 CFR 173.24, 173.24a, and 173.410. The drum consists of a 16 gauge 55 gallon galvanized carbon steel drum with three rolling hoops, 16 gauge removable lid, 12 gauge closure ring with 5/8" diameter bolt and nut with locking nut, and an elastomer gasket. A compliance summary given in Attachment 5 demonstrates packages meet IP-1 and excepted package requirements.

WSRC is not aware of any shipping or incident experiences relative to this application. The LEUO contents and corresponding number of drums per conveyance will be limited so that there is no increased likelihood of criticality under normal or accident conditions during the shipments. Normal condition containment and shielding are provided by the excepted packaging which is DOT authorized for LSA-II materials.

Westinghouse Savannah River Company appreciates your assistance with this request.

Sincerely,

SAFETY EVALUATION REPORT

Request for Exemption from the Department of Transportation Requirement
for Low Enriched Uranium Shipments

Docket 04-10-0000

INTRODUCTION

The Department of Energy Savannah River Operations Office (DOE-SR) has submitted a request for exemption (Reference 1) from a Department of Transportation (DOT) requirement for low-enriched uranium oxide (LEUO) shipments in 227 of 382 fifty-five-gallon galvanized steel drums. The LEUO material in 155 of the drums meets the 49 CFR 173.403 definition of LSA-II solid material with the 173.453(d) fissile materials exception; i.e., U-235 enrichment less than 1%. The LEUO material in the remaining 227 drums has U-235 enrichment slightly above 1%, with the maximum being 1.084%. DOE is seeking relief from the 173.453(d) requirement that limits the U-235 enrichment to a maximum of 1%, specifically "Uranium enriched in U-235 to a maximum of one percent by weight" as stated in 49 CFR that will become effective on October 1, 2004. The exemption is sought for the period-of-time required to ship the 227 drums from the Savannah River Site (SRS) to the Nevada Test Site. It has been estimated that the shipments will be completed within nine months from the time the exemption is granted.

DOE-SR has considered options for shipment of this LEUO material with U-235 enrichment greater than 1 wt.% (but ≤ 1.084 wt.%), including developing a Type A fissile package, or mixing depleted uranium with LEUO to reduce the average U-235 enrichment in the drums. The cost and the additional radiological risk associated with these options, however, has been found difficult to justify, given the one-way, one-time-only shipment of the rather limited amount of the LEUO material. The continued indefinite storage of the material at the SRS is also contrary to the objective of a risk-managed accelerated cleanup.

A request for exemption from the DOT requirement appears to be the only viable option, and the proposed alternative by DOE-SR is one that will strictly limit the total content mass (weight) in the corresponding number of drums in each conveyance so that criticality safety is ensured for the worst-case accident scenario; i.e., total breach of drums where LEUO forms an optimally moderated sphere that is water reflected. Array analysis of drums has also been conducted to demonstrate criticality safety under normal conditions of transport (NCT) in accordance with the requirements in 10 CFR 71.59(a)(1). The criticality safety analyses performed by Westinghouse Savannah River Company (WSRC) are documented in Attachments 4 and 6 of Reference 2.

In its early interaction with DOE on the exemption request, DOT indicated that a separate, independent confirmatory review of the criticality safety analyses of the LEUO shipments is to be conducted by the DOE Office of Licensing (EM-24). This Safety Evaluation Report contains EM-24's technical evaluation of the approach and results of WSRC's criticality safety analyses, which is described in the following sections of the report.

TECHNICAL EVALUATION

Spherical safe mass values for the LEUO material

For a given amount of fissile material, the most reactive configuration is one that achieves optimal moderation, minimizes leakage, and attains full reflection of neutrons emitted from the fissile material, e.g., U-235, for subsequent chain reactions. A $\text{UO}_3/\text{H}_2\text{O}$ mixture in spherical geometry with water surrounding the sphere is generally regarded as the most reactive configuration that can be achieved at a certain intermediate ratio (H/U) of the moderator content in the mixture.

Monte Carlo calculations were performed using the MCNP-4C code to obtain the safe spherical mass of LEUO and the results are given in Attachment 4 of Reference 2. MCNP-4C is a general-purpose Monte Carlo radiation transport code developed and maintained by Los Alamos National Laboratory and used widely by members of the criticality safety community. $\text{UO}_3/\text{H}_2\text{O}$ mixtures in spherical geometry surrounded by 30-cm water were modeled in the MCNP calculations with the water content in the mixtures varying from 0 to 40 wt.% (to determine the optimum moderation), and with U-235 enrichments of 1.084, 1.05, 1.0, and 0.99 wt.%. The criticality safety criterion used is a k_{safe} value of 0.948 such that the calculated $k_{\text{eff}} + 2\sigma \leq k_{\text{safe}}$, where k_{eff} is the effective neutron multiplication factor and σ is the standard deviation associated with the statistical uncertainty of the MCNP-4C calculations. Table 1 below lists the values of the spherical safe mass thus obtained with optimum moderation and full reflection.

Table 1: MCNP-4C calculated spherical safe mass for $\text{UO}_3/\text{H}_2\text{O}$ mixtures with optimum moderation and full reflection by water

U-235 enrichment (wt%)	0.99	1.0	1.05	1.084
Spherical safe mass (metric tons, MT)	17.1	14.5	7.5	5.25

The spherical safe mass values of 7.5 and 5.25 metric tons in Table 1 are used to generate the conveyance loading plans for the LEUO drums listed in Attachment 1 of Reference 2. There are two groups of planned shipments. The drums listed in the Group 1 loading plan were selected with U-235 enrichments ranging from 0.987 to 1.036 wt.% that incorporated the 1.3% uncertainty in the enrichment measurements (i.e., $1.00 - 0.013 = 0.987$ and $1.05 - 0.014 = 1.036$, Attachment 2A, Reference 2). The drums listed in the Group 2 loading plan were selected with U-235 enrichments ranging from 1.037 to 1.084 wt.%.

There are seven shipments in Group 1 for drums of LEUO with U-235 enrichment less than 1.05 wt.%. Each shipment in Group 1 contains fewer than or equal to 21 drums with a total mass of $\text{UO}_3 < 7.5$ MT. There are six shipments in Group 2 for drums of LEUO with U-235 enrichment less than 1.08 wt.%. Each shipment in Group 2 contains either 15 or 14 drums with a total mass of $\text{UO}_3 < 5.25$ MT. The total UO_3 mass in each conveyance shipment limits the amount of fissile material to a value below that of the spherical safe mass, with a margin of safe mass varying from at least 3.4% for any of the Group 1 shipments to at least 1.1% for any of the Group 2 shipments listed in Attachment 1 of Reference 2.

EM-24 Evaluation - The spherical safe mass values in Table 1 for $\text{UO}_3/\text{H}_2\text{O}$ mixtures agree very well with the results of independent calculations documented in Reference 3 for $\text{UO}_2\text{-H}_2\text{O}$ homogeneous mixtures; the extra oxygen atom in UO_3 is not expected to have any significant effect on the criticality calculations. The use of a criticality safety criterion, $k_{\text{safe}} = 0.948$, is slightly more conservative than the usual value of 0.95 with a safety margin of 5%. The assumption of a $\text{UO}_3/\text{H}_2\text{O}$ mixture in spherical geometry with optimum moderation and full reflection is the most conservative case and, therefore, the limits placed on the number of LEUO drums in the shipment plan (Attachment 1 of Reference 2) should ensure criticality safety, even for the worst-case hypothetical accident.

Criticality analysis for arrays of UO_3 drums

10 CFR 71.59 defines standards for arrays of fissile material packages that are applicable to the LEUO drums. Part (a) of 71.59 states "... the designer of a fissile material package shall derive a number N based on all of the following conditions being satisfied, assuming packages are stacked together in any arrangement and with close full reflection on all sides of the stack by water:

- (1) Five times N undamaged packages with nothing between the packages would be subcritical;
- (2) Two times N damaged packages, if each package were subjected to the tests specified in §71.73 (Hypothetical accident conditions) would be subcritical with optimum interspersed homogeneous moderation; and
- (3) The value of N cannot be less than 0.5."

Criticality calculations were performed for arrays of UO_3 drums using the MCNP-4C code and the details of the models and results are given in Attachment 6 of Reference 2. Based on the drum-loading plan described above, two 3-D array configurations were modeled, one with five rows of 24 drums in each row and arranged with a triangular pitch (4-5-6-5-4), for a total of 120 drums; and the other a 5 x 5 x 5 square-pitch array for a total of 125 drums. The total number of drums in either configuration bounds the "5N" undamaged packages that vary from 80 to 105 (i.e., 16 to 21 drums) in the LEUO Group 1 shipments and 70 to 75 (i.e., 14 or 15 drums) in the LEUO Group 2 shipments.

In all of the array calculations, each drum was modeled as a cylinder (55.88-cm ID x 83.82-cm internal height) with wall, top and bottom treated as 16-gauge (0.1519-cm thickness) carbon steel. Each drum was assumed to contain 750 lb of UO₃ with a maximum U-235 enrichment of 1.084 wt.%, and with 3 to 24 wt.% H₂O. The fissile solution in each drum was modeled as a cylinder filling the internal radius of the drum; other parameters considered in the 3-D array models included the gap, i.e., surface-to-surface separation, between drums (0, 2, 4 cm), interstitial water density (0, 10, 20, and 100 wt.%), and full reflection on all sides of the arrays by water. The criticality safety criterion, $k_{\text{eff}} + 2\sigma \leq k_{\text{safe}}$, where $k_{\text{safe}} = 0.948$ and k_{eff} and σ are from the MCNP calculations for the arrays, is the same as that used for the determination of the spherical safe mass.

Altogether 48 MCNP-4C cases were studied covering the stated parameter space. The two cases that have the highest values of $k_{\text{eff}}(\sigma) = 0.9161$ (0.0005) and 0.9058 (0.0005) are, respectively, Problem #19 for a triangular-pitch array of 120 drums and Problem #37 for a square-pitch array of 125 drums, both with 18 wt.% H₂O in the UO₃/H₂O mixture inside each drum, zero gap, and no interstitial moderation between drums. In both cases, the values of $k_{\text{eff}} + 2\sigma$ are less than $k_{\text{safe}} = 0.948$.

EM-24 Evaluation - Highly conservative assumptions were employed in the MCNP-4C calculations for arrays of drums that exceeded the actual number of the LEUO drums in the shipment plan described in Attachment 1 of Reference 2. Even though water is not present inside an undamaged drum or outside between drums during normal conditions of transport, its presence was not only assumed, but also varied, along with other parameters (gap width and pitch) in the MCNP calculations to determine the most reactive configuration for the 3D array of the LEUO drums. The calculated $k_{\text{eff}} + 2\sigma$ for the most reactive array configuration is 0.91710, which is significantly less than $k_{\text{safe}} = 0.948$, thus ensuring criticality safety for the planned shipments of the LEUO drums under normal conditions of transport. EM-24 has performed independent MCNP calculations that confirmed the results for the most reactive, bounding configurations of the arrays shown in Table 2.

With regard to the requirements in 10 CFR 71.59(a), it should be noted that the array analysis only applies to 5N "undamaged" packages (or drums) where N is either 24 or 25 for the triangular or square pitch arrays, respectively. The 2N "damaged" package is not invoked here because the worst case damaged configuration, i.e., UO₃/H₂O mixture in spherical geometry with optimum moderation and full reflection, has already been assumed and analyzed to obtain the spherical safe mass for the LEUO shipments. Therefore, it is not necessary to perform criticality calculations for 2N "damaged" packages where N is either 24 or 25, which is greater than 0.5 in 10 CFR 71.59(a)(3).

The transport index (TI) for nuclear criticality control defined in 10 CFR 71.59(b), $TI = 50/N$, with N derived in the manner described in 10 CFR 71.59(a)(1), is $TI = 2$ for $N = 25$, and $TI = 2.1$ for $N = 24$, which means the drums may be shipped by any carrier, and that the carrier provides adequate criticality control by limiting the sum of TI to 50 in a non-exclusive use vehicle, and to

100 in an exclusive use vehicle, according to 10 CFR 71.59(c). For a non-exclusive use vehicle, the sum of TI of 50 limits the number of packages (drums) in a conveyance to 25 or 24, which bounds the number of the LEUO drums in any of the shipments listed in Attachment 1, Reference 2.

Table 2: Comparison of results in the MCNP calculations for the most reactive, bounding configurations of arrays of drums

	H ₂ O (mixture / interstitial, wt.%)	Gap (cm)	k _{eff} (σ)	k _{eff} + 2σ
<u>Triangular pitch</u>				
WSRC	(18 / 0)	0	0.9161 (0.0005)	0.91710

CONCLUSION

The basis for the exemption request is the number of excepted LEUO drums with uranium-235 enrichments greater than 0.987 wt.% (1% minus uncertainty) will be limited on each conveyance to ensure criticality safety. The safe spherical mass criticality analysis provided in Attachment 4 of Reference 2 established the most conservative mass limits for the allowed number of the LEUO drums in the shipments listed in Attachment 1 of Reference 2. If the drums were subjected to the hypothetical accident conditions in 10 CFR Part 71 (drop and fire), it is anticipated that the drums would breach and the LEUO contents disperse, rather than conglomerate into a sphere with optimum moderation and full reflection. The calculations for arrays containing up to 120-125 drums of LEUO material that bound the number of drums in the conveyance-loading plan (Attachment 1, Reference 2) have also demonstrated criticality safety conservatively for the most reactive array configurations under NCT. These statements and conclusions are confirmed in EM-24's independent confirmatory evaluation.

Sampling Plan for Low Enriched Uranium Trioxide (U)

SRS has 381 drums of low-enriched uranium trioxide (LEUO₃) drums stored in Building 221-21F. The LEUO₃ was produced by the Mark 15 campaign in the early 1980s. WSRC needs the LEUO₃ characterization data to perform a disposition alternatives study to fulfill our DOE commitment for a recommended disposition pathway by September 30, 2003.

SRTC will analyze the LEUO₃ for radionuclides, elemental impurities, organic compounds and physical properties as identified in Tables 2-6. The analytical requirements are based on 10 CFR 61.55, the applicable RCRA and DOT requirements, potential vendor waste acceptance criteria (WAC) and the TVA Low Enriched Uranyl Nitrate Specification.

The ²³⁵U content by drum is available from the analyses performed during the production campaign (D. R. Barton, Jr. to D. C. Bonfer, March 17, 1986). Analytical data for some radionuclides and chemical impurities based on 10-drum composites is available in the same document. The RCRA, DOT, WAC and TVA requirements necessitate lower levels of detection than were performed for this data to achieve the safest, most cost effective disposition pathway.

The available analytical data shows that the ²³⁵U content steadily increases during the production run. The ²³⁵U content exceeds the natural uranium concentration (0.711%) by the 33rd drum and the eversafe concentration (0.90% ²³⁵U) in the 78th drum. The ²³⁵U content remains above the eversafe concentration until the last 10 drums, but never drops under the natural uranium concentration. One drum is identified as LEUO₃ material from the secondary dust collector.

Based on our knowledge of the source material and the process, the LEUO₃ is considered homogeneous within each drum for radionuclide and chemical impurity content. WSRC is disposing other uranium materials via the same potential disposition vendors. These vendors accepted these materials with a minimal amount of analytical data with the WSRC assurance that the materials are homogeneous. Therefore, this sample plan assumes that each drum is a homogeneous mixture. Between drums, the ²³⁵U content will vary. The drums will be sampled by a scoop from the top of each drum. A statistically representative set of samples shall be pulled from the 381 drums.

The sample material will be obtained by removing 20 grams of oxide from the top of each drum. Operations will arrange the transportation of 1-gram samples from each drum to SRTC for the characterization analyses. The remaining sample material will be retained for possible recheck, and the RCRA-certified laboratory analyses. Each sample will be identified by drum number, and stored in a cool dry location away from sunlight until needed. The RCRA analyses will be held pending the outcome of the disposition alternatives study.

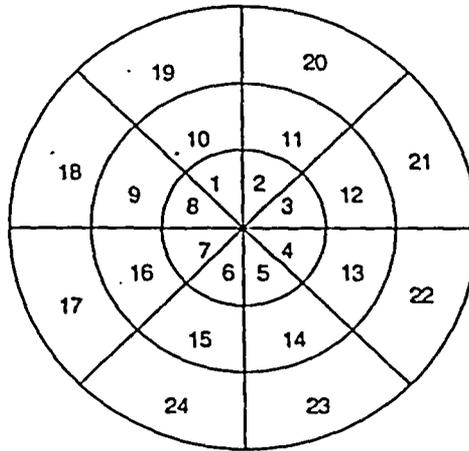

The sample material shall be taken from the drums identified in Table 1. The drum numbers for the entire LEUO inventory are 9092-9471, and 9514. In addition to the statistical sampling, the following drums will be sampled:

- Drum 9433 - previous results indicated 4.0% ²³⁵U content,
- Drums 9341 & 9462 - no recorded ²³⁵U content,
- Drums 9124, 9125, 9169 & 9170 - ²³⁵U content transitions, and
- Drum 9514 - contains material removed from the secondary dust collector.

Hafnium	≤ 100	Titanium	≤ 200
Iron	≤ 400	Tungsten	≤ 200
Lithium	≤ 100	Vanadium	≤ 200
Manganese	≤ 200	Zirconium	≤ 100

If the LEU₃ is disposed as waste, an independent, certified¹ laboratory may be required to analyze for these RCRA constituents.

Table 4
 RCRA Constituents

Constituent	RCRA Limit ,ppm ¹	Constituent	RCRA Limit ,ppm ¹
Arsenic	5.000	Hexachlorobenzene	0.130
Barium	100.000	Hexachlorobutadiene	0.500
Benzene	0.500	Hexachloroethane	3.000
Cadmium	1.000	Lead	5.000
Carbon tetrachloride	0.500	Lindane	0.400
Chlordane	0.030	Mercury	0.200
Chlorobenzene	100.000	Methoxychlor	10.000
Chloroform	6.000	Methyl ethyl ketone	200.000
Chromium	5.000	Nitrobenzene	2.000
o-Cresol ²	200.000	Pentachlorophenol	100.000
m-Cresol ²	200.000	Pyridine	5.000
p-Cresol ²	200.000	Selenium	1.000
Cresol ²	200.000	Silver	5.000
2,4-D	10.000	Tetrachloroethylene	0.700
1,4-Dichlorobenzene	7.500	Toxaphene	0.500
1,2-Dichloroethane	0.500	Trichloroethylene	0.500
1,1-Dichloroethylene	0.700	2,4,5-Trichlorophenol	400.000
2,4-Dinitrotoluene	0.130	2,4,6-Trichlorophenol	2.000
Endrin	0.020	2,4,5-TP (Silvex)	1.000
Heptachlor (and its epoxide)	0.008	Vinyl chloride	0.200

¹ Results reported as parts per million (ppm) are "mg/L" for liquids, and "mg/kg" for solids.

² If o-, m-, and p-Cresol concentrations cannot be differentiated, the total cresol concentration is used. The total cresol limit is 200 mg/L.

The following analytical requirements are included in the potential vendors' waste acceptance criteria:

Table 5
 Vendor Waste Acceptance Criteria Constituents

Constituent	Typical Vendor's WAC Limit
Copper	Not Applicable
Zinc	9000 mg/L
Cyanide	25 ppm
Hydrogen sulfide	25 ppm
Paint Filter Test	No Free Liquids
pH (soil pH-method 9045)	Not Applicable
Is it an oxidizer or reducer?	Not Applicable
Photo-ionizing sniffer (gross organic)	Not Applicable
Density	± 0.1 g/cc

Potential constituents identified in the previously noted regulatory documents and/or waste acceptance criteria were excluded from the characterization analysis based on the provided reasoning:

Table 6
 Excluded Analyses

Constituent	Exclusion Reasoning
Pesticides and herbicides	None used in the production process
Volatile organic compounds ¹	Removed by the production process
C-14	Process knowledge
Ni-59	Process knowledge
Radionuclides with less than 5-year half-lives ²	Process knowledge and isotope half-lives

Cf-251	Process knowledge

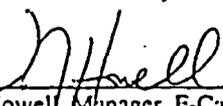

¹ The LEU stream was processed through 4 high-heat manufacturing steps that eliminated any volatile organic compounds.

² The Mark 15 campaign was conducted in the mid-1980s. Isotopes with less than a 5-year half-life will have been reduced by radioactive decay (+3 cycles) to less-than-detectable concentrations. In addition, the LEU stream was processed through 2 solvent extraction cycles that either entirely removed or initially reduced these radionuclide concentrations to trace levels.

Please sign in the designated space to acknowledge your approval of this sample plan to characterize the LEUO₃.

SUBJECT: RADIOCHEMISTRY DATA VALIDATION FOR LOW ENRICHED URANIUM OXIDE

Validation of the Low Enriched Uranium Oxide radiochemistry data analyzed by SRTC was completed with no anomalies noted. The process was performed to meet Nevada Test Site waste acceptance criteria to validate a portion of the chemical and radiological data for characterization purposes. Attached are copies of the case narrative report, completed validation checklist/summary sheet, and data validation worksheet.

Chemical analyses and subsequent validation of that data were performed by an independent source at General Engineering Laboratories, Inc.

If there are any questions regarding this information or process, please call me at 2-2271.

Calibration Information:

Calibration Information

All initial and continuing calibration requirements have been met.

Standards Information

Applicable standard solution(s) for analyses are traceable to NIST and used before the expiration date(s).

Sample Geometry

All counting sources were prepared in the same geometry as the calibration standards.

Quality Control (QC) Information:

Blank Information

Information fell within the acceptance criteria for method blanks.

QC Information

All of the QC samples (spikes, duplicates, and laboratory control samples) met the required acceptance limits for %R and RPD.

Technical Information:

Holding Time

All samples were analyzed within the required holding time.

Preparation Information

All preparation criteria have been met for these analyses.

Sample Re-prep/Re-analysis

Two samples did not agree with the historical record (9125 and 9198) during mass spectrometry for uranium. A second aliquot was dissolved and diluted and reanalyzed. The result of 9125 agreed with the initial preparation. The first result for 9198 was 0.24at% U-235 while the reanalysis resulted in 0.51at% U-235. A third aliquot for sample 9198 was therefore prepared, starting with 230 mg and diluting from there. The third result agreed with the first analysis giving 0.26at% U-235. After discussing this with the generator, another aliquot of each sample

was reanalyzed. Sample 9198 was still significantly depleted while the historical record indicates it should be very slightly enriched. The analysis of the resubmitted sample 9125 indicates that it is nearly natural in its U-235 content, agreeing with the historical record.

Miscellaneous Information:

NCR Documentation

No NCR was generated for the preparation and analysis of this sample set.

This validation was completed using *Environmental Geochemistry Group Operating Handbook Section 1.800 Analytical Data Qualification* and *LEHR Environmental Restoration/Waste Management Standard Operating Procedure SOP NO. 21.1*.

The following reviewer validated the information presented in this file sufficient.

VALIDATION OF RADIOCHEMISTRY DATA

Sample ID: 9234, 9258, 9282, 9306, 9330, 9342, 9366, 9390, 9414, 9438, 9450
9124, 9125, 9169, 9170, 9341, 9453, 9514, 9150, 9174, 9198, 9486
 Laboratory: Analytical Development Section of SRTC
 Analysis: gas flow proportional counting, liquid scintillation, gamma/mass/alpha spec
 Date: _____
 Review completed by: _____

HOLDING TIMES

Have all samples been analyzed within 180 days? Yes No N/A

If any sample fails this criterion, apply "J" qualifier to all sample results.

LABORATORY CONTROL SAMPLE

Are all laboratory control sample (LCS) recoveries (%R) within QC limits? Yes No N/A

If any LCS compound fails this criterion, apply qualifiers to the failed compound in all samples associated with that LCS, according to the following guidelines:

Condition	Positives	Non-Detects
Gross Alpha, Beta: $\pm 30\% < \%R \leq \pm 90\%$ Upper/Lower Limit	"J"	"UJ"
$\%R > \pm 90\%$ Upper/Lower Limit	"J"	"R"
All others: $\pm 25\% < \%R \leq \pm 75\%$ Upper/Lower Limit	"J"	"UJ"
$\%R > \pm 75\%$ Upper/Lower Limit	"J"	"R"

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Are all matrix spike (MS)/matrix spike duplicate (MSD) recoveries (%R) within QC limits? Yes No N/A

Review MS recoveries and apply qualifiers to failed compounds in all associated samples.

Condition	Positives	Non-Detects
Gross Alpha, Beta: $\pm 30\% < \%R \leq \pm 90\%$ Upper/Lower Limit	"J"	"UJ"
$\%R > \pm 90\%$ Upper/Lower Limit	"J"	"R"
All others: $\pm 25\% < \%R \leq \pm 75\%$ Upper/Lower Limit	"J"	"UJ"
$\%R > \pm 75\%$ Upper/Lower Limit	"J"	"R"

BLANKS

Are all blank results below Reporting Limits? Yes No N/A

only applies to 10-99, all others were below reporting limits. All 10-99 results should have a "J" code.

Are Field/Rinse Blanks, if present, below Reporting Limits? Yes No N/A

If the blank results fall outside the appropriate limits, qualify the results for all associated samples that are less than 10 times the blank value as estimated. "J" or "UJ".

CALIBRATIONS

Has the laboratory identified in the case narrative report that calibration was completed on the instrument prior to analysis? Yes No N/A

Discussed with laboratory personnel and was acceptable for methods that used calibration standards.

FIELD DUPLICATES (IF APPLICABLE)

Do field duplicate values generally look similar? Yes No N/A

Field duplicate samples may be taken and analyzed as an indication of overall precision. These analyses measure both field and lab precision; therefore, the results may have more variability than lab duplicates that measure only lab performance. It is expected that soil duplicate results will have a greater variance than water matrices due to difficulties associated with collecting identical field samples. Any evaluation of field duplicates shall be provided with the reviewer's comments.

Mr. D. C. Bonfer
Westinghouse Materials Company of Ohio
P. O. Box 398704
Cincinnati, Ohio 45239

Mr. Bonfer:

The recent enriched uranium (Mark 15) productivity campaign generated 380 drums of uranium trioxide (UO_3) that were packaged as slightly enriched uranium. The majority of our sample analyses for the Mark 15 campaign have been completed. Uranium trioxide analyses are contained in Table I (^{235}U isotopic by weight for individual drums) and Table II (ten drum composite sample analyses). The transuranic alpha activity and total beta activity analyses are not yet complete.

As you indicated, composite sample 9335-9344 was mistakenly not shipped to your site. If needed, we will send this sample with our first shipment of enriched UO_3 .

Please contact me at (803) 557-4263 (FTS 227-4263) if I can be of further assistance.

Very truly yours,

D. R. Barton, Jr., Engineer
Separations Technology Dept.

[Technical Links](#) > [Health Guidelines](#) > [Uranium & Insoluble Compounds](#)

Disclaimer: The information contained in these guidelines is intended for reference purposes only. It provides a summary of information about chemicals that workers may be exposed to in their workplaces. The information may be superseded by new developments in the field of industrial hygiene. Readers are therefore advised to regard these recommendations as general guidelines and to determine whether new information is available.

OCCUPATIONAL SAFETY AND HEALTH GUIDELINE FOR URANIUM AND INSOLUBLE COMPOUNDS

INTRODUCTION

This guideline summarizes pertinent information about uranium and insoluble uranium compounds (measured as uranium) for workers and employers as well as for physicians, industrial hygienists, and other occupational safety and health professionals who may need such information to conduct effective occupational safety and health programs. Recommendations may be superseded by new developments in these fields; readers are therefore advised to regard these recommendations as general guidelines and to determine periodically whether new information is available.

APPLICABILITY

This guideline applies to metallic uranium and all insoluble uranium compounds; examples of such compounds include triuranium octaoxide, uranium dioxide, uranium hydride, uranium tetrafluoride, and uranium trioxide. The physical and chemical properties of uranium and of some insoluble uranium compounds are presented below for illustrative purposes.

SUBSTANCE IDENTIFICATION

Metallic uranium

* Formula

U

* Structure

(For Structure, see paper copy)

* Synonyms

U; Uranium metal, pyrophoric; uranium.

* Identifiers

1. CAS 7440-61-1.
2. RTECS YR3490000.
3. DOT UN: 2979 65 (for the pyrophoric forms of the metal).
4. DOT labels: Radioactive and Flammable Solid.

* Appearance and odor

Elemental uranium is a heavy, malleable, silvery white, lustrous, radioactive metal that is pyrophoric when finely divided. When uranium is obtained by reduction, it takes the form of a black powder. In its natural state, uranium has three isotopes: (234)U, (235)U, and (238)U. U-238 has a half life of 4,510,000,000 years.

CHEMICAL AND PHYSICAL PROPERTIES

*** Physical data**

1. Atomic number: 92.
2. Atomic weight: 238.03.
3. Boiling point (760 torr): 3818 degrees C (6904 degrees F).
4. Specific gravity (water = 1): 19.05 + 0.02 at 20 degrees C (68 degrees F).
5. Vapor density: Not applicable.
6. Melting point: 1132.3 degrees C (2070 degrees F).
7. Vapor pressure at 20 degrees C (68 degrees F): Nearly zero.
8. Solubility: Insoluble in water, alcohol, and alkalies; soluble in acids.
9. Evaporation rate: Not applicable.

Triuranium Octaoxide

*** Formula**

U₃O₈

*** Structure**

(For Structure, see paper copy)

*** Synonyms**

Uranium oxide, pitchblende, nasturan, uraninite.

*** Identifiers**

1. CAS 1317-99-3.
2. RTECS YR3400000.
3. Specific DOT number: None.
4. Specific DOT label: None.

*** Appearance and odor**

Triuranium octaoxide is an olive green to black, odorless solid.

CHEMICAL AND PHYSICAL PROPERTIES

*** Physical data**

1. Molecular weight: 842.1.
2. Boiling point: Not applicable.
3. Specific gravity (water = 1): 8.30 at 20 degrees C (68 degrees F).
4. Vapor density: Not applicable.
5. Melting point: 1300 degrees C (2372 degrees F) (decomposes to uranium dioxide).
6. Vapor pressure at 20 degrees C (68 degrees F): Nearly zero.
7. Solubility: Insoluble in water; soluble in nitric and sulfuric acids.
8. Evaporation rate: Not applicable.

Uranium dioxide

* Formula

UO₂

* Structure

(For Structure, see paper copy)

* Synonyms

Uranous oxide, black uranium oxide, uranium oxide, uranic oxide, urania, yellow cake.

* Identifiers

1. CAS 1344-57-6.
2. RTECS: None.
3. Specific DOT number: None.
4. Specific DOT label: None.

* Appearance and odor

Uranium dioxide is a pyrophoric, black, crystalline solid. It occurs naturally in various minerals including uraninite, pitchblende, and tyuyamunite. The latter is the most important mineral commercially.

CHEMICAL AND PHYSICAL PROPERTIES

* Physical data

1. Molecular weight: 270.03.
2. Boiling point: Data not available.
3. Specific gravity (water = 1): 10.96 at 20 degrees C (68 degrees F).
4. Vapor density: Not applicable.

5. Melting point: 2858-2898 degrees C (5176-5248 degrees F).
6. Vapor pressure: Not applicable.
7. Solubility: Insoluble in water; soluble in concentrated sulfuric acid and nitric acid.
8. Evaporation rate: Not applicable.

Uranium hydride

* Formula

UH(3)

* Structure

(For Structure, see paper copy)

* Synonyms

Uranium trihydride.

* Identifiers

1. CAS 13598-56-6.
2. RTECS: None.
3. Specific DOT number: None.
4. Specific DOT label: None.

* Appearance and odor

Uranium hydride is a brownish-black or brownish-gray, pyrophoric powder.

CHEMICAL AND PHYSICAL PROPERTIES

* Physical data

1. Molecular weight: 241.05.
2. Boiling point (760 torr): Not applicable.
3. Specific gravity (water = 1): 10.95 at 20 degrees C (68 degrees F).
4. Vapor density: Not applicable.
5. Melting point: Decomposes.
6. Vapor pressure at 20 degrees C (68 degrees F): Nearly zero.
7. Solubility: Insoluble in water, alcohol, acetone, or liquid ammonia; slightly soluble in dilute hydrogen chloride; decomposes in nitric acid.
8. Evaporation rate: Not applicable.

Uranium tetrafluoride

* Formula

UF₄

* Structure

(For Structure, see paper copy)

* Synonyms

Green salt.

* Identifiers

1. CAS 10049-14-6.
2. RTECS: None.
3. Specific DOT number: None.
4. Specific DOT label: None.

* Appearance and odor

Uranium tetrafluoride is a nonvolatile, green, odorless, crystalline solid.

CHEMICAL AND PHYSICAL PROPERTIES

* Physical data

1. Molecular weight: 314.
2. Boiling point (760 torr): 1417 degrees C (2582 degrees F).
3. Specific gravity (water = 1): 6.7 at 20 degrees C (68 degrees F).
4. Vapor density: Not applicable.
5. Melting point: 955-965 degrees C (1751-1769 degrees F).
6. Vapor pressure at 20 degrees C (68 degrees F): Nearly zero.
7. Solubility: Insoluble in water; soluble (decomposes) in concentrated acids and alkalis.
8. Evaporation rate: Not applicable.

* Reactivity

1. Conditions contributing to instability: Heat, flame, or exposure to air. Uranium metal reacts with nearly all nonmetals. Uranium turnings and fines stored out-of-doors in closed containers under water or water-soluble oil will convert partially to the hydride and will eventually ignite during hot weather.
2. Incompatibilities: Pure uranium is very reactive and is a strong reducing agent. Clean uranium turnings or chips oxidize readily in air. Contact of uranium with carbon dioxide,

carbon tetrachloride, or nitric acid causes fires or explosions. Uranium hydride is spontaneously flammable in air, and contact of the hydride with strong oxidizers may cause fires and explosions. Contact of uranium hydride with water forms flammable and explosive hydrogen gas, and contact of the hydride with halogenated hydrocarbons can cause violent reactions. In finely divided form, uranium dioxide ignites spontaneously in air.

3. Hazardous decomposition products: Toxic particulates, gases, and vapors (such as uranium metal fume, oxides of uranium, hydrogen fluoride, carbon monoxide, and dangerous radioactive materials) may be released when uranium or an insoluble uranium compound decomposes.

4. Special precautions: Uranium is radioactive and highly reactive and should be handled with extreme caution at all times. Uranium tetrafluoride is highly corrosive.

* Flammability

The National Fire Protection Association has not assigned a flammability rating to uranium or the insoluble uranium compounds. Other sources rate uranium in solid or powder form as a very dangerous fire hazard when this substance is exposed to heat or open flame.

1. Flash point: Data not available.

2. Autoignition temperature: The ignition temperature depends on the extent to which the metal is subdivided. The ignition temperature of the metal is 170 degrees C (338 degrees F) (if oxygen is present); finely divided uranium metal (dust) ignites at room temperature (20 degrees C (68 degrees F)).

3. Flammable limits in air: Not applicable.

4. Minimum explosive concentration: 60 g/m³.

5. Extinguishant: Use graphite chips, carbon dust, asbestos blankets, or flooding with water to extinguish small uranium fires. There is no effective way to extinguish large uranium fires.

Fires involving uranium or an insoluble uranium compound should be fought upwind and from the maximum distance possible. Keep unnecessary people away; isolate hazard area and deny entry. Emergency personnel should stay out of low areas and ventilate closed spaces before entering. Finely divided uranium (chips, turnings, shavings, etc.) are much more reactive than uranium in bulk form. If these are present during a fire, do not disperse them into a dust cloud, which may be explosive. Uranium metal may ignite spontaneously if exposed to air or other substances, may burn rapidly with a flare-burning effect, and may re-ignite after the fire has been extinguished. Containers of uranium or an insoluble uranium compound may explode in the heat of the fire and should be moved from the fire area if it is possible to do so safely. If this is not possible, cool containers from the sides with water until well after the fire is out. Stay away from the ends of containers. Personnel should withdraw immediately if a rising sound from a venting safety device is heard or if there is discoloration of a container due to fire. Dikes should be used to contain fire-control water for later disposal. If a tank car or truck is involved in a fire, personnel should isolate an area of a half a mile in all directions. Delay cleanup until arrival of, or instruction from, a qualified radiation authority. Firefighters should wear a full set of protective clothing, including a self-contained breathing apparatus, when fighting fires involving uranium or an insoluble uranium compound. Firefighters' protective clothing may provide limited protection against fires involving uranium or an insoluble uranium compound.

* Warning properties

No quantitative data are available on the odor threshold for uranium or insoluble uranium compounds; several of these substances are odorless. For the purpose of selecting appropriate respiratory protection, these substances are therefore considered to have inadequate odor warning properties.

* Eye irritation properties

No quantitative data are available on the eye irritation threshold for uranium or the insoluble uranium compounds.

EXPOSURE LIMITS

The current Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs) for uranium and the insoluble uranium compounds (measured as uranium) are 0.2 milligram per cubic meter (mg/m³) of air as an 8-hour time-weighted average (TWA) concentration and 0.6 mg/m³ as a 15-minute TWA short-term exposure limit (STEL). A STEL is the maximum 15-minute concentration to which workers may be exposed during any 15-minute period of the working day [29 CFR 1910.1000, Table Z-1-A]. The National Institute for Occupational Safety and Health (NIOSH) has not issued a recommended exposure limit (REL) for uranium or its insoluble uranium compounds; however, NIOSH concurs with the PEL established for this substance by OSHA [NIOSH 1988]. The American Conference of Governmental Industrial Hygienists (ACGIH) has assigned uranium and the insoluble uranium compounds a threshold limit value (TLV) of 0.2 mg/m³ as a TWA for a normal 8-hour workday and a 40-hour workweek and a short-term exposure limit (STEL) of 0.6 mg/m³ for periods not to exceed 15 minutes [ACGIH 1988, p. 37]. The OSHA and ACGIH limits are based on the risk of kidney and blood disorders and on the radiological damage associated with exposure to uranium or an insoluble uranium compound.

HEALTH HAZARD INFORMATION

* Routes of exposure

Exposure to uranium or an insoluble uranium compound can occur via inhalation, ingestion, and eye or skin contact. Exposure to uranium trioxide can occur by absorption through the skin, eyes, and mucous membranes.

* Summary of toxicology

1. Effects on Animals: Metallic uranium and insoluble uranium compounds may produce both chemical poisoning and radiation injury to the kidneys and lungs of exposed animals [Clayton and Clayton 1981, p. 1996]. The insoluble uranium compounds are less toxic chemically than the soluble compounds, but uranium and all uranium compounds have the potential to cause radiation damage [Clayton and Clayton 1981, p. 2000; Klaassen, Amdur, and Doull 1986, p. 695]. The inhalation toxicity of uranium and the insoluble compounds of uranium is much greater than their oral toxicity [Clayton and Clayton 1981, p. 2000]. No dietary amount of insoluble uranium compounds acceptable to rats was lethal, and no evidence of systemic poisoning developed after the application of an insoluble compound to rabbit skin [Clayton and Clayton 1981, p. 2000]. However, uranium trioxide is lethal when placed in the conjunctival sac of rabbits' eyes, and uranium tetrafluoride causes direct eye injury [Grant 1986, p. 965]. Acute inhalation exposure to 20-mg/m³ concentrations of uranium tetrafluoride, uranium dioxide, or high-grade uranium ore was occasionally fatal to some laboratory animals; exposure to a 2.5-mg/m³ concentration of uranium tetrafluoride, uranium dioxide, or high-grade uranium ore caused mild or no renal damage and no fatalities in these animals [Clayton and Clayton 1981, p. 2001]. Chronic inhalation exposure to an insoluble uranium compound may produce radiation injury. In dogs and monkeys exposed to 5 mg/m³ uranium dioxide for 6 hours/day, 5 days/week for up to 5 years, fibrotic changes suggestive of radiation injury were found in the tracheobronchial lymph nodes of both species and in the lungs of monkeys. No kidney damage was observed in these animals [Clayton and Clayton 1981, p. 2002]. Dogs tolerated inhalation of a 10-

mg/m³ concentration of uranium dioxide every day for 1 year and dietary exposure to 10 g/kg/day for 1 year [Clayton and Clayton 1981, pp. 2001-2002]. Rats injected with metallic uranium in the femoral bone marrow and chest wall developed site-of-contact sarcomas; in these cases, the effects of chemical injury could not be distinguished from those of radiation damage [Clayton and Clayton 1981, p. 2003].

2. Effects on Humans: Metallic uranium and insoluble uranium compounds may produce both chemical poisoning and radiation injury [Clayton and Clayton 1981, p. 1996]. The insoluble uranium compounds are less toxic chemically than the soluble compounds, but uranium and all uranium compounds have the potential to cause radiation damage [Clayton and Clayton 1981, p. 2000; Klaassen, Amdur, and Doull 1986, p. 695]. Exposure to the dusts of uranium or to an insoluble uranium compound may cause respiratory irritation, cough, and shortness of breath [Genium MSDS 1988, No. 238]. Dermatitis has also been reported, and prolonged skin contact causes radiation injury to the basal cells [Proctor, Hughes, and Fischman 1988, p. 502]. Studies have shown that uranium workers are at increased risk of death from respiratory, lymphatic, and hematopoietic cancers; these deaths are presumed to be caused by radiation injury from radon gas, a byproduct of uranium decay [Rom 1983, p. 688]. A study of the risk of respiratory deaths among uranium miners in the United States showed the following dose-response: miners exposed occupationally for 5 to 9.9 years had a 2-fold increase in risk; miners exposed for 10 to 24.9 years had a 3.6-fold increase in risk; and those exposed for greater than 24.9 years had a 3.75-fold increase in risk. Smoking was shown both to increase the risk of death from respiratory disease and to shorten the neoplastic latency period [Clayton and Clayton 1981, pp. 2010-2011].

* Signs and symptoms of exposure

1. Acute exposure: The signs and symptoms of acute exposure to uranium or an insoluble uranium compound include respiratory irritation, cough, and shortness of breath.

2. Chronic exposure: The signs and symptoms of chronic exposure to uranium or an insoluble uranium compound include those of lung damage: shortness of breath, dry or productive cough, rales, cyanosis, and clubbing of the fingers. Long-term exposure also may cause cancer of the blood-forming system, the lymph system, and the respiratory tract, as well as anemia and leukopenia. The signs and symptoms of uranium-induced dermatitis may include irritation, redness, blistering, thickening, or hyperpigmentation of the skin.

* Emergency procedures:

In the event of an emergency, remove the victim from further exposure, send for medical assistance, and initiate the following emergency procedures:

1. Eye exposure: If uranium or an insoluble uranium compound gets into the eyes, immediately flush the eyes with large amounts of water for a minimum of 15 minutes, lifting the lower and upper lids occasionally. If irritation persists, get medical attention as soon as possible.

2. Skin exposure: If uranium or an insoluble uranium compound contacts the skin, the contaminated skin should be washed with soap and water. Contaminated body surfaces should immediately be decontaminated in accordance with radiation procedures. Get medical attention.

3. Inhalation: If uranium or an insoluble uranium compound is inhaled, move the victim at once to fresh air and get medical care as soon as possible. If the victim is not breathing, perform cardiopulmonary resuscitation; if breathing is difficult, give oxygen. Keep the victim warm and quiet until medical help arrives.

4. Ingestion: If uranium or an insoluble uranium compound is ingested, give the victim several glasses of water to drink and then induce vomiting by having the victim touch

the back of the throat with the finger or by giving syrup of ipecac as directed on the package. Do not force an unconscious or convulsing person to drink liquids or to vomit. Get medical help immediately. Keep the victim warm and quiet until medical help arrives.

5. Rescue: Remove an incapacitated worker from further exposure and implement appropriate emergency procedures (e.g., those listed on the Material Safety Data Sheet required by OSHA's Hazard Communication Standard, 29 CFR 1910.1200). All workers should be familiar with emergency procedures and the location and proper use of emergency equipment.

EXPOSURE SOURCES AND CONTROL METHODS

The following operations may involve uranium and insoluble uranium compounds and lead to worker exposures to these substances:

- Mining, grinding, and milling of uranium ores
- Use in nuclear reactors as fuel and to pack nuclear fuel rods and in the production of nuclear weapons
- Burning of uranium metal chips and smelting operations
- Use in the ceramics industry for pigments, coloring porcelain, painting on porcelain, and enamelling
- Use as catalysts for many reactions, in gas manufacture, and in production of fluorescent glass
- Use in photographic processes, for alloying steel, in radiation shielding, and in aircraft counterweights
- Use as a source of plutonium and radium salts

Uranium hydride:

* Use as a lab source for pure hydrogen, for separation of hydrogen isotopes, and as a reducing agent

Methods that are effective in controlling worker exposures to uranium and insoluble uranium compounds, depending on the feasibility of implementation, are

- Process enclosure,
- Local exhaust ventilation,
- General dilution ventilation, and
- Personal protective equipment.

The following publications are good sources of information on control methods:

1. ACGIH [1986]. Industrial ventilation--a manual of recommended practice. Cincinnati, OH: American Conference of Governmental Industrial Hygienists.
2. Burton DJ [1986]. Industrial ventilation--a self study companion. Cincinnati, OH: American Conference of Governmental Industrial Hygienists.
3. Alden JL, Kane JM [1982]. Design of industrial ventilation systems. New York, NY: Industrial Press, Inc.
4. Wadden RA, Scheff PA [1987]. Engineering design for control of workplace hazards. New York, NY: McGraw-Hill.
5. Plog BA [1988]. Fundamentals of industrial hygiene. Chicago, IL: National Safety Council.

MEDICAL MONITORING

Workers who may be exposed to chemical and radiation hazards should be monitored in a systematic program of medical surveillance that is intended to prevent occupational injury and disease. The program should include education of employers and workers about work-related hazards, placement of workers in jobs that do not jeopardize their safety or health, early detection of adverse health effects, and referral of workers for diagnosis and treatment. The occurrence of disease or other work-related adverse health effects should prompt immediate evaluation of primary preventive measures (e.g., industrial hygiene monitoring, engineering controls, and personal protective equipment). A medical monitoring program is intended to supplement, not replace, measures. To place workers effectively and to detect and control work-related health effects, medical evaluations should be performed (1) before job placement, (2) periodically during the period of employment, and (3) at the time of job transfer or termination.

*** Preplacement medical evaluation**

Before a worker is placed in a job with a potential for exposure to uranium or an insoluble uranium compound, the examining physician should evaluate and document the worker's baseline health status with thorough medical, environmental, and occupational histories, a physical examination, and physiologic and laboratory tests appropriate for the anticipated occupational risks. These should concentrate on the function and integrity of the kidneys, respiratory system, blood, liver, bone marrow, skin, and lymphatics. Medical monitoring for respiratory disease should be conducted using the principles and methods recommended by NIOSH and the American Thoracic Society.

A preplacement medical evaluation is recommended to assess an individual's suitability for employment at a specific job and to detect and assess medical conditions that may be aggravated or may result in increased risk when a worker is exposed to uranium or an insoluble uranium compound at or below the prescribed exposure limit. The examining physician should consider the probable frequency, intensity, and duration of exposure as well as the nature and degree of any applicable medical condition. Such conditions (which should not be regarded as absolute contraindications to job placement) include a history and other findings consistent with diseases of the kidneys, respiratory system, blood, liver, bone marrow, skin, or lymphatics.

*** Periodic medical examinations and biological monitoring**

Occupational health interviews and physical examinations should be performed at regular intervals during the employment period, as mandated by any applicable State, or local standard. Where no standard exists and the hazard is minimal, evaluations should be conducted every 3 to 5 years or as frequently as recommended by an experienced occupational health physician. Additional examinations may be necessary if a worker develops symptoms attributable to uranium exposure. The interviews, examinations, and medical screening tests should focus on identifying the adverse effects of uranium on the kidneys, respiratory system, blood, liver, bone marrow, skin, or lymphatics. Current health status should be compared with the baseline health status of the individual worker or with expected values for a suitable reference population.

Biological monitoring involves sampling and analyzing body tissues or fluids to provide an index of exposure to a toxic substance or metabolite. Urinary uranium concentrations correlate well with airborne uranium levels. Some sources report that urinary concentrations of 50 µg uranium per liter of urine or 100 µg uranium per liter of urine correspond to constant daily exposures of approximately 0.05 mg/m³ or 0.25 mg/m³, respectively. Because there is great interindividual and intraindividual variability in urinary uranium concentrations, a pattern of urinary uranium excretion should be established for every exposed worker by sampling individuals at the same time on several different shifts and by sampling frequently.

*** Medical examinations recommended at the time of job transfer or termination**

The medical, environmental, and occupational history interviews, the physical examination, and selected physiologic or laboratory tests that were conducted at the time of placement should be repeated at the time of job transfer or termination to determine the worker's medical status at the end of his or her employment. Any changes in the worker's health status should be compared with those expected for a suitable reference population. Because occupational exposure to uranium or an insoluble uranium compound may cause diseases with prolonged latent periods, the need for medical monitoring may extend well beyond the termination of employment.

WORKPLACE MONITORING AND MEASUREMENT PROCEDURES

Determination of a worker's exposure to airborne uranium or an insoluble uranium compound (measured as uranium) is made using a mixed cellulose ester filter (0.8 micron). Samples are collected at a maximum flow rate of 2 liters per minute until a maximum air volume of 960 liters is collected. Analysis is conducted by neutron activation. This method is included in the OSHA In-House Methods File.

PERSONAL HYGIENE PROCEDURES

If uranium or an insoluble uranium compound contacts the skin, workers should immediately wash the affected areas with soap and water. Contaminated body surfaces should immediately be decontaminated in accordance with radiation procedures.

Clothing contaminated with uranium or an insoluble uranium compound should be removed immediately, and provisions should be made for the safe removal of the chemical from the clothing. Persons laundering the clothes should be informed of the toxic and radioactive hazards of uranium.

A worker who handles uranium or an insoluble uranium compound should thoroughly wash hands, forearms, and face with soap and water before eating, using tobacco products, or using toilet facilities.

Workers should not eat, drink, or use tobacco products in areas where uranium or an insoluble uranium compound is handled, processed, or stored.

STORAGE

Uranium and insoluble uranium compounds should be stored in a cool, dry, well-ventilated area in tightly sealed containers that are labeled in accordance with OSHA's Hazard Communication Standard [29 CFR 1910.1200]. Containers of uranium or of insoluble uranium compounds should be protected from physical damage and should be stored separately from carbon dioxide, carbon tetra-chloride, nitric acid, air, nonmetals, heat, sparks, and open flame. Uranium hydride should not be allowed to contact air, water, strong oxidizers, or halogenated hydrocarbons. Because empty containers that formerly contained uranium or a uranium compound may still hold product residues, they should be handled appropriately.

SPILLS AND LEAKS

In the event of a spill or leak involving uranium or an insoluble uranium compound, persons not wearing protective equipment and clothing should be restricted from contaminated areas until cleanup has been completed. A clean-up plan must be available to address an accidental leak or spill of uranium or an insoluble uranium compound because special radiation procedures are required and professional assistance is needed. The following steps should be undertaken following a spill or leak:

1. Do not touch the spilled material; stop the leak if it is possible to do so without risk.
2. Notify safety personnel.

3. Remove all sources of heat and ignition.
4. Ventilate the area of the spill or leak.
5. Protect cleanup personnel from contact with or inhalation of uranium dust.

EMERGENCY PLANNING, COMMUNITY RIGHT-TO-KNOW, AND HAZARDOUS WASTE MANAGEMENT REQUIREMENTS

The Environmental Protection Agency's (EPA's) regulatory requirements for emergency planning, community right-to-know, and hazardous waste management may vary over time. Users are therefore advised to determine periodically whether new information is available.

*** Emergency planning requirements**

Uranium and insoluble uranium compounds are not subject to EPA emergency planning requirements under the Superfund Amendments and Reauthorization Act (Title III).

*** Reportable quantity requirements (releases of hazardous substances)**

Employers are not required by the emergency release notification provisions of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) [40 CFR Part 355.40] to notify the National Response Center of an accidental release of uranium or an insoluble uranium compound; there is no reportable quantity for these substances.

*** Community right-to-know requirements**

Employers are not required by Section 313 of the Superfund Amendments and Reauthorization Act (SARA) to submit a Toxic Chemical Release Inventory form (Form R) to EPA reporting the amount of uranium or an insoluble uranium compound emitted or released from their facility annually.

*** Hazardous waste management requirements**

EPA considers a waste to be hazardous if it exhibits any of the following characteristics: ignitability, corrosivity, reactivity, or toxicity, as defined in 40 CFR 261.21-261.24. Under the Resource Conservation and Recovery Act (RCRA), EPA has specifically listed many chemical wastes as hazardous. Although uranium and insoluble uranium compounds are not specifically listed as a hazardous waste under RCRA, EPA requires employers to treat any waste as hazardous if it exhibits any of the characteristics discussed above.

Providing more information about the removal and disposal of specific chemicals is beyond the scope of this guideline. EPA, U.S. Department of Transportation, and State and local regulations should be followed to ensure that removal, transport, and disposal of this substance are conducted in accordance with existing regulations. To be certain that chemical waste disposal meets EPA regulatory requirements, employers should address any questions to the RCRA hotline at (202) 382-3000 (in Washington, D.C.) or toll-free at (800) 424-9346 (outside Washington, D.C.). In addition, relevant State and local authorities should be contacted for information on any requirements they may have for the waste removal and disposal of this substance.

RESPIRATORY PROTECTION

*** Conditions for respirator use**

Good industrial hygiene practice requires that engineering controls be used where feasible to reduce workplace concentrations of hazardous materials to the prescribed

exposure limit. However, some situations may require the use of respirators to control exposure. Respirators must be worn if the ambient concentration of uranium or an insoluble uranium compound exceeds prescribed exposure limits. Respirators may be used (1) before engineering controls have been installed, (2) during work operations such as maintenance or repair activities that involve unknown exposures, (3) during operations that require entry into tanks or closed vessels, and (4) during emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by NIOSH and the Mine Safety and Health Administration (MSHA).

* Respiratory protection program

Employers should institute a complete respiratory protection program that, at a minimum, complies with the requirements of OSHA's Respiratory Protection Standard [29 CFR 1910.134]. Such a program must include respirator selection (see Table 1), an evaluation of the worker's ability to perform the work while wearing a respirator, the regular training of personnel, fit testing, periodic workplace monitoring, and regular respirator maintenance, inspection, and cleaning. The implementation of an adequate respiratory protection program (including selection of the correct respirator) requires that a knowledgeable person be in charge of the program and that the program be evaluated regularly. For additional information on the selection and use of respirators and on the medical screening of respirator users, consult the **NIOSH Respirator Decision Logic** and the **NIOSH Guide to Industrial Respiratory Protection**.

Table 1 lists the respiratory protection that NIOSH recommends for workers exposed to uranium or an insoluble uranium compound. The recommended protection may vary over time because of changes in the exposure limit for uranium or the insoluble uranium compounds or in respirator certification requirements. Users are therefore advised to determine periodically whether new information is available.

PERSONAL PROTECTIVE EQUIPMENT

Protective clothing should be worn to prevent skin contact with uranium or an insoluble uranium compound. Impervious gloves, boots, and aprons should be worn as appropriate when handling any of these substances. Chemical protective clothing should be selected on the basis of available performance data, manufacturers' recommendations, and evaluation of the clothing under actual conditions of use. No reports have been published on the resistance of various protective clothing materials to permeation by uranium or an insoluble uranium compound; however, one source recommends natural rubber, neoprene, or polyvinyl chloride as a protective clothing material. If permeability data are not readily available, protective clothing manufacturers should be requested to provide information on the best chemical protective clothing for workers to wear when they are exposed to uranium or an insoluble uranium compound.

If uranium or an insoluble uranium compound is dissolved in an organic solvent, the permeation properties of both the solvent and the mixture must be considered when selecting personal protective equipment and clothing.

Safety glasses, goggles, or faceshields should be worn during operations in which uranium or an insoluble uranium compound might contact the eyes. Eyewash fountains and emergency showers should be available within the immediate work area whenever the potential exists for eye or skin contact with uranium or its insoluble compounds. Contact lenses should not be worn if the potential exists for exposure to any of these substances.

Table 1

NIOSH recommended respiratory protection for workers exposed to uranium or an insoluble uranium compound*

Condition	Minimum respiratory protection**
Airborne concentration of uranium or an insoluble uranium compound:	
0.2 to 2 mg/m ³ (10 X PEL)	Any air-purifying, half-mask respirator equipped with a fume or high-efficiency filter approved for radon daughters or radionuclides, or Any air-purifying, full-facepiece respirator equipped with a fume filter approved for radon daughters, or Any supplied-air respirator equipped with a half mask and operated in a demand (negative-pressure) mode
0.2 to 5 mg/m ³ (25 X PEL)	Any powered, air-purifying respirator equipped with a hood or helmet and a fume or high-efficiency filter approved for radon daughters or radio-nuclides, or Any supplied-air respirator equipped with a hood or helmet and operated in a continuous-flow mode
0.2 to 10 mg/m ³ (50 X PEL)	Any air-purifying, full-facepiece respirator equipped with a high-efficiency filter approved for radon daughters or radio-nuclides, or Any powered, air-purifying respirator equipped with a tight-fitting facepiece and a high-efficiency filter approved for

radon daughters or radio-nuclides, or

Any supplied-air respirator equipped with a full facepiece and operated in a demand (negative-pressure) mode, or

Any supplied-air respirator equipped with a tight-fitting facepiece and operated in a continuous-flow mode, or

Any self-contained respirator equipped with a full facepiece and operated in a demand (negative-pressure) mode

0.2 to 30 mg/m(3)
(150 X PEL)

Any supplied-air respirator operated in a pressure-demand or other positive-pressure mode

Entry into IDLH(+)
or unknown
concentrations

Any self-contained respirator equipped with a full facepiece and operated in a pressure-demand or other positive-pressure mode, or

Any supplied-air respirator equipped with a full facepiece and operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode

Firefighting

Any self-contained respirator equipped with a full facepiece and operated in a pressure-demand or other positive-pressure mode

Escape

Any air-purifying, full-facepiece respirator equipped with a high-efficiency filter approved for radon daughters or radionuclides, or

Any escape-type, self-contained breathing apparatus with a suitable service life (number of minutes required to escape the environment)

* The OSHA PEL is 0.2 mg/m(3) as an 8-hour TWA. No NIOSH REL has been issued.

** Only NIOSH/MSHA-approved equipment should be used. Also note the following:

1. Respirators accepted for use at higher concentrations may be used at lower concentrations; respirators must not, however, be used at concentrations higher than those for which they are approved.

2. Air-purifying respirators may not be used in oxygen-deficient atmospheres or in airborne concentrations that are immediately dangerous to life or health (IDLH).

(+) The uranium or an insoluble uranium compound concentration that is immediately dangerous to life and health (IDLH) is 30 mg/m(3) [NIOSH 1987b].

Introduction

While performing the nuclear criticality safety evaluation (NCSE) for disposal of drums of UO_3 currently stored in F-Area [1], safe spherical mass values for several different ^{235}U enrichments were calculated. This information was not included in the NCSE, but is documented in this memorandum in the event that it could be of use at some future time.

Methodology

Monte Carlo calculations were used to perform the calculations for the UO_3 spherical safe mass calculations. A configuration controlled version of MCNP 4C was used to perform these calculations. MCNP 4C is a general purpose Monte Carlo radiation transport code that numerically simulates neutral and charged particle transport histories, using continuous energy cross-section libraries and general three-dimensional geometry. The MCNP code was developed by, and is maintained at, the Los Alamos National Laboratory. Configuration control of MCNP 4C is documented for the Washington Safety Management Solutions (WSMS) LINUX workstation cluster in Reference 2. A sample input file for the calculations is provided in Appendix A.

A k_{SAFE} of 0.948 was used as the acceptance criteria for these calculations. The derivation of this k_{SAFE} value and discussion of Area of Applicability (AOA) for this material is documented in Reference 1. Calculated values of $k_{\text{eff}} + 2\sigma < k_{\text{SAFE}}$ will indicate configurations that are safely subcritical. Configurations with calculated $k_{\text{eff}} + 2\sigma \geq k_{\text{SAFE}}$ will be considered unacceptable. For this evaluation, σ is defined as the statistical uncertainty associated with the MCNP 4C calculations.

UO_3 /water mixtures in spherical geometry are modeled in these calculations. The water content of the mixture is varied from 0 to 40 weight percent so that the point of optimum moderation can be determined. Each sphere is reflected with 30 cm of water. Calculations were performed for ^{235}U enrichment values of 1.084 (the maximum for the stored UO_3), 1.05, 1.0, and 0.99 weight percent ^{235}U . The mass values reported in the results section of this document were determined with the assistance of scoping calculations that are not reported here.

The ENDF/B-VI cross sections supplied with MCNP 4C are used exclusively in these calculations except for the $S(\alpha,\beta)$ cross section for hydrogen in water which is based on ENDF/B-V. The following materials are used in the MCNP calculations for the UO_3 safe mass calculations:

- 1) Various uranium trioxide (UO_3) solutions are modeled with an isotopic enrichment of 1.084% U-235 (cross sections 92235.60c, 92238.60c, 1001.60c, and 8016.60c). The mass density of UO_3 used is 7.29 g/cm^3 [3] and the mass density of water used is 1.0 g/cm^3 . Thermal scattering from the hydrogen in these mixtures is modeled with the 300 K light water $S(\alpha,\beta)$ table (lwtr.01t).

- 2) Plain water is modeled as 2 atoms of H and 1 atom of O. Cross sections 1001.60c, and 8016.60c and a mass density of 1.0 g/cm³ are used. Thermal scattering from the hydrogen in water is modeled with the 300 K light water S(α,β) table (lwtr.01t).

Results

The results of the spherical safe mass calculations are provided in Table 1.

Table 1: Spherical Safe Mass Calculation Results

ud80	40	0.7426	0.0005	0.7435

Conclusions

As shown in the results above, the safe spherical mass values for UO₃ at different enrichments are as follows:

1.084 Wt%	5.25 MT
1.05 Wt%	7.5 MT
1.00 Wt%	14.5 MT
0.99 Wt%	17.1 MT

Appendix A Sample MCNP 4C Input File

One of the MCNP 4C input files used in the spherical safe mass calculations is provided below. This basic input file was used for all drum calculations with necessary changes to material composition depending on the requirements of the case. File *ud37* models a sphere containing 5.25 metric tons of UO_3 at a ^{235}U enrichment of 1.084 weight percent with sufficient water such that the water content of the sphere is 15 wt% water. The sphere is reflected with 30 cm of water.

ATTACHMENT 5

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

LEUO 55 Gallon Drum IP-1 Container

The information in this report documents the LEUO 55 Gallon Drum IP-1 Container design compliance with 49 CFR requirements for IP-1 packaging. The document contains a 1) Regulatory Compliance Summary and Shipper Duties, and 2) Closing Instructions (Attachment 1).

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

REGULATORY REQUIREMENT	ACTION REQUIRED AND BY WHOM	COMPLIANCE BY LEUO 55 GALLON DRUM CONTAINER
<p>PART 173--SHIPPERS—GENERAL REQUIREMENTS FOR SHIPMENTS AND PACKAGINGS—Table of Contents Subpart B—Preparation of Hazardous Materials for Transportation</p> <p>Sec. 173.24 General requirements for packagings and packages.</p> <p>(a) Applicability. Except as otherwise provided in this subchapter, the provisions of this section apply to—</p> <ol style="list-style-type: none"> (1) Bulk and non-bulk packagings; (2) New packagings and packagings which are reused; and (3) Specification and non-specification packagings. <p>(b) Each package used for the shipment of hazardous materials under this subchapter shall be designed, constructed, maintained, filled, its contents so limited, and closed, so that under conditions normally incident to transportation—</p> <ol style="list-style-type: none"> (1) Except as otherwise provided in this subchapter, there will be no identifiable (without the use of instruments) release of hazardous materials to the environment; (2) The effectiveness of the package will not be substantially reduced; for example, impact resistance, strength, packaging compatibility, etc. must be maintained for the minimum and maximum temperatures encountered during transportation; (3) There will be no mixture of gases or vapors in the package, which could, through any credible spontaneous increase of heat or pressure, significantly reduce the effectiveness of the packaging. <p>(c) Authorized packagings. A packaging is authorized for a hazardous material only if</p>	<p><u>Shipper to ensure.</u></p> <p><u>Shipper to ensure.</u></p> <p>To be considered during package design evaluation.</p> <p><u>Shipper to ensure.</u></p> <p>To be considered during design evaluation.</p> <p><u>Shipper to ensure.</u></p>	<p>This packaging has been evaluated herein and meets DOT IP-1 packaging criteria of 173.411(b). The packaging consists of a 16 gauge 55 gallon galvanized carbon steel drum with three rolling hoops manufactured to the DOT 17C construction specification, 16 gauge removable lid, 12 gauge closure ring with 5/8" diameter bolt and nut, and an elastomer gasket (see FSS-TS-2004-0001 for gasket/materials evaluation).</p> <p>This packaging meets this requirement by confining contents within a carbon steel drum, with elastomer gasket and lid held together by a ring closure with 5/8" bolt and nut.</p> <p>This packaging meets this requirement by incorporating a commercially supplied, vibration resistant, 55 gallon open head drum.</p> <p>Shipper to ensure that contents loaded into package conform to the appropriate content category (e.g. LSA content).</p>

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

<p>(ii) The closure is secure and leakproof. (2) Except as otherwise provided in this subchapter, a closure (including gaskets or other closure components, if any) used on a specification packaging must conform to all applicable requirements of the specification.</p>	<p><u>Shipper to ensure.</u></p>	<p>Shipper to ensure proper closure instructions are followed.</p> <p>Note: Shipper to follow closure instructions provided in Attachment 1</p>
<p>(g) Venting. Venting of packagings, to reduce internal pressure which may develop by the evolution of gas from the contents, is permitted only when—</p> <p>(1) Transportation by aircraft is not involved;</p> <p>(2) Except as otherwise provided in this subchapter, the evolved gases are not poisonous, likely to create a flammable mixture with air or be an asphyxiant under normal conditions of transportation;</p> <p>(3) The packaging is designed so as to preclude an unintentional release of hazardous materials from the receptacle; and</p> <p>(4) For shipments in bulk packagings, venting is authorized for the specific hazardous material by a special provision in the Sec. 172.101 table or by the applicable bulk packaging specification in part 178 of this subchapter.</p>	<p><u>NA</u></p>	<p>There are no vents on this packaging design.</p>
<p>(h) Outage and filling limits—</p> <p>(1) General. When filling packagings and receptacles for liquids, sufficient ullage (outage) must be left to ensure that neither leakage nor permanent distortion of the packaging or receptacle will occur as a result of an expansion of the liquid caused by temperatures likely to be encountered during transportation. Requirements for outage and filling limits for non-bulk and bulk packagings are specified in Secs. 173.24a(d) and 173.24b(a), respectively.</p>	<p><u>NA</u></p>	<p>This packaging is not designed for liquids.</p>

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

<p>(3) Securing and cushioning. Inner packagings of combination packagings must be so packed, secured and cushioned to prevent their breakage or leakage and to control their movement within the outer packaging under conditions normally incident to transportation. Cushioning material must not be capable of reacting dangerously with the Contents of the inner packagings or having its protective properties significantly weakened in the event of leakage.</p> <p>(4) Metallic devices. Nails, staples and other metallic devices shall not protrude into the interior of the outer packaging in such a manner as to be likely to damage inner packagings or receptacles.</p> <p>(4) Vibration. Each non-bulk package must be capable of withstanding, without rupture or leakage, the vibration test procedure specified in Sec. 178.608 of this subchapter.</p>	<p><u>Designer to do and shipper to ensure.</u></p> <p><u>Designer to do and shipper to ensure.</u></p> <p><u>Designer to do and shipper to ensure.</u></p>	<p>The LEUO will be confined in an inner 3-6 mil plastic liner within the LEUO 55 gallon drum. The liner is constrained between the contents and the drum so movement is minimal. No containment credit is taken for the liner.</p> <p>The 55 gallon galvanized steel drum has a smooth interior. The LEUO content conforms to the inside of the container and has no metallic feature likely to damage the drum.</p> <p>Fifty five gallon open head drum packages have been used for decades in transportation and have proven vibration resistance.</p>
<p>(b) Non-bulk packaging filling limits.</p> <p>(1) A single or composite non-bulk packaging may be filled with a liquid hazardous material only when the specific gravity of the material does not exceed that marked on the packaging, or a specific gravity of 1.2 if not marked, except as follows:</p> <p>(i) A Packing Group I packaging may be used for a Packing Group II material with a specific gravity not exceeding the greater of 1.8, or 1.5 times the specific gravity marked on the packaging.</p>	<p><u>NA</u></p>	<p>This packaging is not designed for liquid contents.</p>

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

<p>provided all the performance criteria can still be met with the higher specific gravity material;</p> <p>(ii) A Packing Group I packaging may be used for a Packing Group III material with a specific gravity not exceeding the greater of 2.7, or 2.25 times the specific gravity marked on the packaging, provided all the performance criteria can still be met with the higher specific gravity material; and</p> <p>(iii) A Packing Group II packaging may be used for a Packing Group III material with a specific gravity not exceeding the greater of 1.8, or 1.5 times the specific gravity marked on the packaging, provided all the performance criteria can still be met with the higher specific gravity material.</p> <p>(2) Except as otherwise provided in this section, a non-bulk packaging may not be filled with a hazardous material to a gross mass greater than the maximum gross mass marked on the packaging.</p> <p>(3) A single or composite non-bulk packaging which is tested and marked for liquid hazardous materials may be filled with a solid hazardous material to a gross mass, in kilograms, not exceeding the rated capacity of the packaging in liters, multiplied by the specific gravity marked on the packaging, or 1.2 if not marked. In addition:</p> <p>(i) A single or composite non-bulk packaging which is tested and marked for Packing Group I liquid hazardous materials may be filled with a solid Packing Group II hazardous material to a gross mass, in kilograms, not exceeding the rated capacity of the packaging in liters, multiplied by 1.5, multiplied by the specific gravity marked on the packaging, or 1.2 if not marked.</p> <p>(ii) A single or composite non-bulk packaging which is tested and marked for Packing Group I</p>	<p><u>Shipper to ensure.</u></p> <p><u>NA</u></p>	<p>Gross mass shall not exceed the 900 pound capacity of the IP-1 package.</p> <p>This packaging is not designed nor tested for liquids.</p>
---	---	--

<p>liquid hazardous materials may be filled with a solid Packing Group III hazardous material to a gross mass, in kilograms, not exceeding the rated capacity of the packaging in liters, multiplied by 2.25, multiplied by the specific gravity marked on the packaging, or 1.2 if not marked.</p> <p>(iii) A single or composite non-bulk packaging which is tested and marked for Packing Group II liquid hazardous materials may be filled with a solid Packing Group III hazardous material to a gross mass, in kilograms, not exceeding the rated capacity of the packaging in liters, multiplied by 1.5, multiplied by the specific gravity marked on the packaging, or 1.2 if not marked.</p> <p>(4) Packagings tested as prescribed in Sec. 178.605 of this subchapter and marked with the hydrostatic test pressure as prescribed in Sec. 178.503(a)(5) of this subchapter may be used for liquids only when the vapor pressure of the liquid conforms to one of the following:</p> <p>(i) The vapor pressure must be such that the total pressure in the packaging (i.e., the vapor pressure of the liquid plus the partial pressure of air or other inert gases, less 100 kPa (15 psia)) at 55 deg.C (131 deg.F), determined on the basis of a maximum degree of filling in accordance with paragraph (d) of this section and a filling temperature of 15 deg.C (59 deg.F)), will not exceed two-thirds of the marked test pressure;</p> <p>(ii) The vapor pressure at 50 deg.C (122 deg.F) must be less than four-sevenths of the sum of the marked test pressure plus 100 kPa (15 psia); or</p> <p>(iii) The vapor pressure at 55 deg.C (131 deg.F) must be less than two-thirds of the sum of the marked test pressure plus 100 kPa (15 psia).</p>	<p>NA</p>	<p>This packaging is not designed for liquid contents.</p>
---	-----------	--

<p>(d) Liquids must not completely fill a receptacle at a temperature of 55 deg.C (131 deg.F) or less.</p> <p>PART 173—SHIPPERS—GENERAL REQUIREMENTS FOR SHIPMENTS AND PACKAGINGS—Table of Contents</p> <p>Subpart I—Class 7 (Radioactive) Materials</p> <p>Sec. 173.410 General design requirements.</p> <p>In addition to the requirements of subparts A and B of this part, each package used for the shipment of Class 7 (radioactive) materials must be designed so that—</p> <p>(a) The package can be easily handled and properly secured in or on a conveyance during transport.</p> <p>(b) Each lifting attachment that is a structural part of the package must be designed with a minimum safety factor of three against yielding when used to lift the package in the intended manner, and it must be designed so that failure of any lifting attachment under excessive load would not impair the ability of the package to meet other requirements of this subpart. Any other structural part of the package which could be used to lift the package must be capable of being rendered inoperable for lifting the package during transport or must be designed with strength equivalent to that required for lifting attachments.</p> <p>(c) The external surface, as far as practicable, will be free from protruding features and will be easily decontaminated.</p>	<p><u>NA</u></p> <p><u>Designer to do and shipper to ensure.</u></p> <p><u>Designer to do and shipper to ensure.</u></p> <p><u>Designer to do and shipper to ensure.</u></p>	<p>This packaging is not designed for liquids.</p> <p>This drum packaging is of standard commercial design and can be handled with commercially available, or appropriate, drum handling equipment. The drum package can be secured in the conveyance by standard blocking/bracing/tie-down methods</p> <p>The packaging (drum) is not equipped with lifting attachments. The drum is to be handled/lifted using standard industrial, or appropriate, drum handling methods.</p> <p>The external surfaces are galvanized carbon steel which can be decontaminated. The drum closure ring system is removable to accommodate decontamination</p>
---	--	---

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

<p>(d) The outer layer of packaging will avoid, as far as practicable, pockets or crevices where water might collect.</p>	<p><u>Designer to do and shipper to ensure.</u></p>	<p>This packaging meets the intent of this requirement. The drum design has clean vertical members and a domed lid that enhances water run off and minimizes water collection.</p>
<p>(e) Each feature that is added to the package will not reduce the safety of the package.</p>	<p><u>Shipper to ensure.</u></p>	<p>It is a shipper responsibility to contact the CTF (WSRC/Transportation Services) if features need to be added to the current packaging design.</p>
<p>(f) The package will be capable of withstanding the effects of any acceleration, vibration or vibration resonance that may arise under normal conditions of transport without any deterioration in the effectiveness of the closing devices on the various receptacles or in the integrity of the package as a whole and without loosening or unintentionally releasing the nuts, bolts, or other securing devices even after repeated use (see Secs. 173.24, 173.24a, and 173.24b).</p>	<p><u>Designer to do, shipper to ensure.</u></p>	<p>Extensive transportation experience with 17C drums has demonstrated that single bolt drum closures are vibration resistant.</p>
<p>(h) The materials of construction of the packaging and any components or structure will be physically and chemically compatible with each other and with the package contents. The behavior of the packaging and the package contents under irradiation will be taken into account.</p>	<p><u>Designer to do, shipper to ensure.</u></p>	<p>The shipper must ensure application of quality assurance during package closing to ensure compliance.</p> <p>The packaging components (carbon steel drum and lid, elastomer gasket, and ring closure) are physically and chemically compatible with each other. The LEUO contents are furthermore enveloped within a plastic liner. All package materials shall be chemically compatible. Radiation will have no adverse effect on the carbon steel. The elastomer gasket will not degrade due to radiation because of the low LEUO dose rates (typical ~1 mrad/hr vs. typical elastomer 1E3 rad dose limit).</p>

LEUO 55 Gallon Drum IP-1 Container, FSS-TS-2004-0005, 6/07/2004

<p>(h) All valves through which the package contents could escape will be protected against unauthorized operation.</p>	<p><u>NA</u></p>	<p>This packaging design has no valves.</p>

Attachment 1. CLOSING INSTRUCTIONS FOR 55 GALLON LEU DRUM IP-1 CONTAINER

Open Head Drum Tested for Solids Only Application

FSS-TS-2004-0004, 1/07/2004

OPEN HEAD DRUM

- STEP 1** Ensure the gasket is properly fitted in lid groove. (Fig.1&2)
- STEP 2** Position lid onto drum curl. (Fig.3) being careful to seat gasket around bead
- STEP 3** Align bolt closure ring onto drum. Ensure the inner channel engages periphery of the entire drum cover. (Fig.4)
- STEP 4** Insert bolt through ring unthreaded lug with bored end. Screw bolt into locking nut, then into threaded ring lug. (Fig.5)
- STEP 5** Tighten bolt while tapping ring until a gap of 1" is achieved. The 1" gap is an indicator that the ring has been properly seated and the remainder of the closing process may be initiated. Torque until a minimum torque of 25 ft. lbs. (as in Fig. 6) is achieved noting that the ring ends should not touch.
- STEP 6** For previously closed drums with ring ends that touch, complete steps 6A & 6B to ensure ring is tight and uniformly installed. A. Ensure ring does not rotate on drum by taping end of ring bolt with rubber mallet. If ring rotates go to step 6C. B. Inspect ring/lid for uniformity. The distance from top of drum lid to ring should not vary by more than 1/16". If ring/lid is not aligned, go to step 6C. C. Remove ring, cut approximately 1/8" from end of ring and go to STEP 3 above to reinstall and tighten ring.

1.0 INTRODUCTION

Reference 1 requests that criticality calculations be performed for arrays of UO_3 -containing drums, with varying degrees of internal and interstitial moderation, in order to support a Department of Transportation (DOT) exemption for the transport of drums containing Low-enriched Uranium Oxide (LEUO).

The calculations performed herein serve to supplement previous calculations involving the same LEUO material, modeled as optimally-moderated spheres reflected by water [9]. The calculations contained in Reference 9, in combination with the calculations contained herein, address hypothetical accident conditions to which the UO_3 drums may be subjected.

3.0 INPUT

Per Reference 1, two different drum arrays are modeled. The first array contains five layers, with 24 drums in each layer, for a total of 120 drums. Each layer is a 4-5-6-5-4 triangular-pitch array. The second array is a 5 by 5 by 5 square-pitch array, for a total of 125 drums. For all arrays, at least 12" of water reflection is present on all sides.

Per Reference 1, each drum contains 750 lb of UO_3 , at an enrichment of 1.084 wt% ^{235}U , with 3 to 24 wt% water. The fissile solution in each drum is modeled as a cylinder filling the internal radius of the drum. In the drums in the top two layers of the arrays, the fissile solution cylinders are modeled at the bottoms of the drums. In the drums in the bottom two layers of the arrays, the fissile solution cylinders are modeled at the tops of the drums. In the drums in the middle layer of the arrays, the fissile solution cylinders are modeled in the middle of the drums.

Each drum is modeled with an internal diameter of 55.88 cm, and an internal height of 83.82 cm [2]. The walls, tops, and bottoms of the drums are modeled as 16 gauge carbon steel (0.1519 cm thick) [1-2].

4.0 ANALYTICAL METHODS AND COMPUTATIONS

4.1 Nuclear Criticality Safety Codes

In performing the criticality calculations in this report, the MCNP 4C code is used [3]. MCNP is a general purpose Monte Carlo radiation transport code that numerically simulates neutral and charged particle transport histories, using continuous energy cross-section libraries and general three-dimensional geometry. The MCNP code was developed, and is maintained, by the Los Alamos National Laboratory (LANL).

4.2 MCNP Code Bias, Statistical Uncertainty, and Acceptance Criteria

Results documented in this report are obtained from the MCNP 4C code, which is under configuration control on the Washington Safety Management Solutions Linux workstation cluster [4]. To account for the statistical uncertainty in the MCNP calculations, the calculated k_{EFF} is adjusted as follows [5]:

$$\text{adjusted } k_{\text{EFF}} = k_{\text{EFF}}^{\text{MCNP}} + 2\sigma_s$$

where σ_s is the statistical uncertainty (standard deviation) calculated by the MCNP code. The standard deviation is multiplied by a factor of two to achieve the 95.4% confidence level, assuming a normal distribution.

For nuclear criticality limits derivations, the adjusted k_{EFF} values are compared to the k_{SAFE} reactivity limit. The k_{SAFE} acceptance criterion is defined as [5]:

$$k_{\text{SAFE}} = 1.0 - \sigma_B - \sigma_M - \sigma_A$$

where σ_B is the MCNP code bias (which includes the bias uncertainty) for a particular fuel, and σ_M and σ_A are margins ensuring sub-criticality. The first margin, σ_M , is the Minimum Subcritical Margin (MSM). It is an arbitrary margin used to ensure sub-criticality against system uncertainties. The second margin, σ_A , is the Area of Applicability (AOA) margin. It is used if it is necessary to account for any extensions to the benchmark area of applicability for the analyzed fissile system.

Reference 6 provides a bias and bias uncertainty analysis for LEU compounds, resulting in $\sigma_B = 0.022$. Key parameters of this analysis and the analyses performed herein are presented in Table 1.

Table 1: Area of Applicability

Parameter	Ref. 6	Present System
Fissile Material	UO ₂ rods, UO ₂ F ₂ , uranyl nitrate solutions, and UF ₄ -polytetrafluoroethylene cubes	UO ₃
Enrichment	2 – 30 wt% ²³⁵ U	1.084 wt% ²³⁵ U
Moderator	water (H/ ²³⁵ U): 75 to 1400 polyethylene (H/ ²³⁵ U): 8 to 64	water (H/ ²³⁵ U): ~90 to 900
Reflector	steel, lead, water, paraffin, or none	water
Geometry	thin rod lattices, spheres, cylinders, and cubes	cylinders
Neutron Spectrum	intermediate to thermal	intermediate to thermal

From Table 1, the key parameters defining the analyses documented herein are all within the AOA of the Reference 6 analyses, with the exception of enrichment and fissile material. In terms of enrichment, the validation AOA covers a range of 2 to 30 wt%. Based on the guidance of Reference 5, the lower end of this range may be extended to 0.5 wt%, which bounds the 1.084 wt% modeled herein. Therefore, no AOA margin is required for this parameter.

In terms of the fissile material, the Reference 6 analyses model a wide variety of LEU compounds including UO₂, while the analyses herein model UO₃. Since MCNP does not model a specific chemical formula (but rather the individual nuclei), the inclusion of UO₂ in the Reference 6 analyses is judged to adequately represent the UO₃ modeled herein. Therefore, no AOA margin is required for this parameter.

Given the simplicity of the calculations performed herein, as well as the conservative fissile density and water content, an MSM of 0.03 is judged to be adequate. Using this MSM with the bias discussed above results in a k_{SAFE} of 0.948.

4.3 Material Cards and Cross-section Libraries

In performing the calculations presented herein, the ENDF/B-VI default cross-sections supplied with MCNP 4C are used exclusively, with the exception that thermal neutron scattering $S(\alpha,\beta)$ cross-sections are based on ENDF/B-V.

The fissile solutions in these analyses are modeled as mixtures of UO_3 and water, at varying $H/^{235}U$ ratios. In calculating specific mixtures, the maximum theoretical density of UO_3 (7.29 g/cm^3 [1]) is employed, and the mass density of water is assumed to be 1.0 g/cm^3 . The isotopic composition of the uranium is assumed to be 1.084 wt% ^{235}U and 98.916 wt% ^{238}U . Thermal scattering from hydrogen in these mixtures is modeled with the 300 K light water $S(\alpha,\beta)$ table (lwtr.01t).

Carbon steel is modeled using the data provided in References 7 and 8. The mass density of the steel is assumed to be 7.82 g/cm^3 [8].

Light water is modeled assuming a mass density of 1.0 g/cm^3 . Thermal scattering from hydrogen is modeled with the 300 K light water $S(\alpha,\beta)$ table (lwtr.01t).

5.0 RESULTS

5.1 Triangular-pitch Arrays

In this section, triangular-pitch arrays are modeled, as described in Section 3.0. Seven different water contents are modeled for the drums: 3, 6, 12, 15, 18, 21, and 24 wt% water. For each water content, at least six cases are executed. The first three cases model the drum array at surface-to-surface (S/S) separations of 0, 2, and 4 cm, with no interstitial water modeled. The second three cases model the most reactive spacing determined from the first three cases^a, with 10, 20, and 100 wt% interstitial water. Additional cases are executed as deemed necessary. A representative model is depicted in Figures 1 and 2, and the results are presented in Tables 2 through 8. Note that the "Problem #" column in the tables refers to the task description in Reference 1.

^a It is expected that the most reactive spacing will always be when the drums are touching, since increasing the spacing of an array without interstitial moderation can only increase neutron leakage.

5.2 Square-pitch Arrays

In this section, square-pitch arrays are modeled, as described in Section 3.0. Four cases are executed for the most reactive water content calculated in Section 5.1 (18 wt% water). The first two cases model the drum array at surface-to-surface (S/S) separations of 0 and 2 cm, with no interstitial water modeled. The second two cases model the most reactive spacing determined from the first two cases, with 10 and 20 wt% interstitial water. A representative model is depicted in Figure 3, and the results are presented in Table 9.

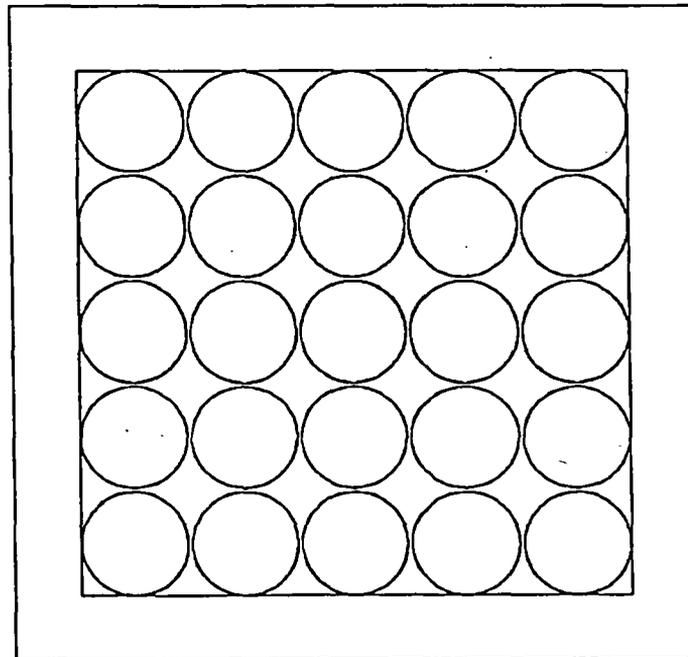

Figure 3: Square-pitch Array Top View (18 wt% water, 2 cm S/S, no interstitial H₂O)

40	anl040	20%	0	0.8965	0.0005

6.0 CONCLUSIONS

The triangular-pitch array calculations presented in Section 5.1 demonstrate, for cases with no interstitial water, that the reactivity of the modeled arrays decreased when the spacing between the drums increased. In addition, for cases with no interstitial water, reactivity was maximized at a water content of 18 wt% in the drums ($H/^{235}U = 635$). At this water content, interstitial water at the modeled densities (10, 20, and 100%) decreased the reactivity of the array.

Therefore, the maximum adjusted k_{EFF} calculated in Section 5.1 (0.9170) is for an array with the drums in physical contact, with no interstitial water, and with a water content of 18 wt% in the drums. Since this maximum adjusted k_{EFF} is below k_{SAFE} , the array configurations modeled in Section 5.1 are safely subcritical.

The square-pitch array calculations presented in Section 5.2 demonstrate that the square-pitch array is less reactive than the triangular-pitch array, at a water content of 18 wt%. In addition, for a water content of 18 wt%, the results demonstrate that the square-pitch array behaves similarly to the triangular-pitch array: increasing the array spacing or adding interstitial water both decrease array reactivity.

7.0 ATTACHMENTS AND APPENDICES

Numerous MCNP cases are executed as part of this engineering calculation. However, these cases are represented in this attachment by a subset of MCNP models, with all other cases requiring only minor modifications of the models in this subset.
