Dennis Henneke and another utility representative (Energy NW) suggested the following classes of manual actions during the Forum, at least as a starting point:

1. MA needed to achieve safe shutdown
2. MA related to circuit failures via spurious actuations
3. MA related to cold shutdown, etc., i.e., ones unrelated to core damage

I'd like to circulate this among the MA cognoscenti (Phil, Dave, Pete, etc.) for feedback - what do you think? Should I hold this as an item for discussion on Thursday (Dave's meeting)?
