#### <u>CAUTION</u>

Updating time on any 10 minute mark (i.e., 1200, 1210, etc.) is detrimental to certain Computer functions, and should be avoided if possible.

- 5. Update Date and Time on operator's console:
  - a. PRESS "Maint Functions" pushbutton.
  - b. ENTER appropriate "Date" and "Time".
  - c. PRESS "Execute" pushbutton.
- 6. VERIFY required points are removed from scan/alarm.
- 7. VERIFY correct parameters are displayed on analog pen recorders and digital displays.
- 8. UPDATE "Group Outputs" requested to be printed on Trend printer:
  - a. Group Output #4 30 minute trend.
  - b. Other Group Outputs per the plaque on the Trend printer.
- 4.2 <u>Steady State</u>
  - <u>NOTE</u>: Procedures for normal keyboard operations are provided in the Computer Manual under Operator's Manual Section.
  - 1. REQUEST a "Post Trip Log" printout for each "Post Trip Log Ready" message, to maintain program availability.
  - 2. UPDATE point R8102K, RCS Boron Conc-Lab, per Chemistry sample.
  - 3. VERIFY computer alarms per associated recorders, instruments, annunciators, or by other indicators.

EOP Setpoints

RCS CORE EXIT TEMPERATURE

Setpoint ID: E.2

Setpoint Value: 700°F

Associated System/Component: RCS

WOG Footnote ID: G.03

**Revision:** 08/31/90

#### Short Description:

Temperature indicative of superheated conditions in the RCS

### Description:

Temperature indicative that superheated conditions exist in the RCS. This setpoint is used as a indication that the core cooling critical safety function may be in jeopardy.

### Display Data:

| INSTRUMENT | UNITS | RANGE | DIVISION | TYPE    | LOCATION |
|------------|-------|-------|----------|---------|----------|
|            |       |       |          |         |          |
| ICCM       | F     |       | 1        | DIGITAL |          |

#### Basis:

A series of generic analyses were performed to investigate recovery from inadequate core cooling conditions for Westinghouse PWR'S. A core exit temperature of 700°F was selected as an indication of superheat conditions in the RCS and was determined to be an appropriate symptom for initiation of certain recovery actions for all Westinghouse PWR's. The Kewaunee Nuclear Plant is similar to the generic plant design with respect to parameters which may significantly affect the symptoms of inadequate core cooling including thermocouple location, core design and safety valve pressure. Therefore, the generic setpoint value is applicable.

Rev. 1A of the Emergency Response Guidelines has modified this setpoint slightly. The setpoint is now 670°F plus instrument uncertainties or 700°F, whichever is higher. From Reference 2, the channel accuracy of the core exit T/Cs is +/- 3.1°F for normal containment conditions, and +/- 27.5°F for adverse containment conditions. Since the maximum error is less than 30°F, a value of 700°F is still appropriate for use in the IPEOPs.

 $\underline{IF}$  level detection system or sump pumps for Containment Sump A are inoperable,  $\underline{THEN}$  REFER to Step 6.4.

Has either sump pump run within the past 23 days? Yes No <u>IF</u> neither sump pump has run within the past 23 days, <u>THEN</u> REFER to Step 6.2.2.

Sump leakage less than or equal to 1 gpm? Yes No <u>IF</u> sump leakage is greater than 1 gpm <u>AND</u> Technical Specification 3.1.d is applicable, <u>THEN</u> DESCRIBE on an Action Request <u>AND</u> REFER to Step 6.2.1.g. [PCR000350]

Upon completion of the weekly leak rate test, ATTACH this Data Sheet to the results. Carry over last pump run to the new Data Sheet 3.

### 3.9 <u>CONTINUED</u>

3. These procedures are identified by the procedure identifier FR.

### 3.10 Integrated Plant Emergency Operating Procedures (IPEOPs)

- 1. Plant procedures that specify the operator actions required to mitigate the consequences of transients and accidents that cause plant parameters to exceed reactor protection system setpoints, engineered safety features setpoints, or other appropriate technical limits.
- 2. The IPEOP network consists of all optimal recovery procedures and functional restoration procedures.
- 3.11 Leaking Steam Generator
  - 1. Any steam generator with demonstrated primary-to-secondary leakage which is less than or equal to charging system capacity.
- 3.12 Local (Locally)
  - 1. An action performed by an operator outside the Control Room.
- 3.13 Manual (Manually)
  - 1. An action performed by an operator in the Control Room. This does not include automatic actions which take place without operator intervention.
- 3.14 Optimal Recovery Procedures (ORPs)
  - 1. Those IPEOPs which provide guidance to recover the plant in the most efficient manner to a safe and stable end state.
  - 2. These procedures are organized to provide the best sequence of actions to address all possible entry conditions.
  - 3. These procedures are identified by the procedure identifiers E, ES, and ECA.

| 6.13<br><u>CONTINUED</u> 11. If a Red, Orange, or Yellow Path condition does not clear<br>following completion of the associated FRP, the FRP need not be<br>performed again unless the Red, Orange, or Yellow Path condition<br>clears and then returns. EXAMPLE After completing FR-Z.1, RESPONSE TO HIGH CONTAINMENT PRESSURE, due to an<br>Orange path condition, the operator notes that containment pressure is<br>still above the Orange Path high pressure setpoint. FR-Z.1 need not be<br>performed again until containment pressure exceeds the Red Path setpoint<br>or until containment pressure decreases to below the Orange Path setpoint<br>and then increases again to greater than the Orange Path setpoint. |                                                                                                                                                                                                                    |                                                                 |                                       |  |

#### Verification Items

#### Purpose

- Clear objective and problem statement
- Affected SSC been identified
- Intended use of results been identified
- Any limitation of applicability
- Revision content been summarized

#### Methodology

.

- Discussion of the method/approach and major steps
- Limitation of use of methodology identified

#### Acceptance Criteria

- Clear definition of acceptance criteria
- Exceptions clearly defined
- Sources of acceptance criteria clearly defined

#### Assumptions

- Sufficient rationale to permit verification of assumption
- Have unverified assumptions been identified as such
  - References provided for assumptions

#### Inputs

- All applicable Design Inputs been identified
- Has source document for inputs been identified
- Computer data program SQA approval

#### References

- Have all controlled plant input documents been identified
- If a procedure is cited, has the process owner been notified
- Are references available from KNPP records, or have they been attached

#### Calculation and Results

- Correct formula/method used to support the objective
- Formula variables (including units) clearly labeled and consistent with sources
- Computer program input/output been reviewed
- Reference to sketches provided
- Sufficient bases/rational to permit verification of engineering judgment
- Proper carry over and use of significant digits

#### Conclusions and Recommendations

- Clear statement of the results consistent with the objective
- Acceptability of the results clearly defined
- Recommendation for unacceptable results, AR written if necessary
- Clear definition of limitations or requirements imposed by the calculation
- necessary to maintain the validity of the results
- Have the effects of the calculation on output documents been identified and addressed

## **50.59 APPLICABILITY REVIEW**

(Is the activity excluded from 50.59 review?)

Document/Activity number: C11617, Revision 0

Brief description of proposed activity (what is being changed and why):

Calculation C11617, "Determination of Containment Radiation Monitor EALs" is being performed to establish baseline values for R-40 & R-41 for the new Emergency Action Levels (EAL) Project.

Does the proposed activity involve or change any of the following documents or processes? Check YES or NO for EACH applicability review item. Explain in comments if necessary. [Ref. NMC 50.59 Resource Manual, Section 4]

NOTE: If you are unsure if a document or process may be affected, contact the process owner.

## **50.59 PRE-SCREENING**

(Is a 50.59 screening required?)

1. Document/Activity number: C11617. Revision 0

2. Brief description of proposed activity (what is being changed and why):

Calculation C11617, "Determination of Containment Radiation Monitor EALs" is being performed to establish baseline values for R-40 & R-41 for new EALs.
Does the proposed activity involve or change any of the following documents or processes? Explain in Comments if necessary.

Check YES or NO for EACH pre-screening item. [Ref. NMC 50.59 Resource Manual, Section 5.1]

NOTE: If you are unsure if a document or process may be affected, contact the process owner.

NOTE: An asterisk (\*) indicates that the document is incorporated by reference in the USAR or is implicitly considered part of the USAR.

NOTE: Check NO if activity/change is considered editorial, administrative, or maintenance as defined in Attachments A, B, and C. Explain in Comments if necessary.

#### KEWAUNEE NUCLEAR POWER PLANT CALCULATION/EVALUATION

CALC/EVAL NO. C11617 REV. 0 PAGE NO. Page 1

#### 1.0 PURPOSE

The purpose of this calculation is to determine the appropriate values for initiation of Emergency Action Levels (EALs) for Containment High Radiation Monitors R-40 and R-41. In particular, the desired values are the radiation monitor responses during a LOCA with 5% clad damage, LOCA with 20% clad damage, and Technical Specification coolant activity limit dispersed into containment. (1.0  $\mu$ Ci/gm DOSE EQUIVALENT I-131, TS 3.1.c)

#### 2.0 BACKGROUND

Kewaunee Nuclear Power Plant (KNPP) is performing an EAL Upgrade Project. As a part of this project, there will be new values used for the action level settings associated with the containment high range radiation monitors. The current action levels associated with these monitors are based on the most limiting of either of two values: 1) value obtained from EPIP-TSC-09A, Core Damage Assessment procedure or 2) 1000 R/hr (automatic General Emergency per Chart B of EPIP-AD-02). During research and collaboration with the other NMC plants, it was determined that Kewaunee needed to verify values for the high range radiation monitors. Therefore, this calculation will define the radiation values seen in containment under the prescribed conditions (EALs) identified in NEI 99-01, Rev. 4. These 3 conditions of interest are:

- o RCS Barrier Loss (EAL #4)
- o Fuel Clad Barrier Loss (EAL #5)
- o Containment Barrier Potential Loss (EAL #6)

The loss of RCS barrier is calculated at the TS limit for coolant activity. The fuel clad barrier loss has radiation level corresponding to  $300 \ \mu$ Ci/gm I-131 equivalent. Assessment by the NUMARC EAL Task Force indicates that this amount of coolant activity is well above that expected for iodine spikes and corresponds to less than 5% fuel clad damage. This amount of radioactivity indicates significant clad damage and thus the Fuel Clad Barrier is considered lost. The containment barrier potential loss corresponds to a value which indicates significant fuel damage well in excess of that required for loss of RCS and Fuel Clad. It is prudent to treat this as a potential loss of containment, such that a General Emergency declaration is warranted. NUREG-1228, "Source Estimations During Incident Response to Severe Nuclear Power Plant Accidents," indicates that such conditions do not exist when the amount of clad damage is less than 20%.

### 3.0 INPUTS AND ASSUMPTIONS

Inputs:

3.0.1 Westinghouse Calculation CN-REA-02-34, Rev. 1, is used as the reference data for this calculation.

3.0.2 Kewaunee Technical Specifications

3.0.3 Updated Safety Analysis Report (USAR)

3.0.4 Offsite Dose Calculation Methodology (ODCM)

Assumptions:

3.1.1 Initial RCS volume dumps into containment during the LOCA.

3.1.2 Release fractions previously contained in the USAR are now internal to the ORIGEN computer code. These values were previously published as USAR table D.1-1 up to Rev. 16.

#### 4.0 METHODOLOGY AND ACCEPTANCE CRITERIA

The method for obtaining the values is as follows:

#### **TS Limit Calculation**

RCS activity values for clad defect (1% failed fuel) are obtained from USAR Table D.4-1 as updated for the Stretch Power Uprate. Dose equivalent factors are obtained from ODCM, Table 2.1 for the noble gases, and TS 1.p (definition section) for the dose equivalent I-131 factors. These values are shown in Attachment A –Table 3. The product of the RCS activites and the dose equiv. factor gives the dose equivalent clad activity which is shown on column 4 of Attachment A – Table 1. Then, the isotopic distribution is given in terms of Dose Equivalent lodine (DEI) I-131 by dividing the I-131 equivalent value into the dose equivalent clad activity. This, in turn, is multiplied by the RCS volume to give the total uCi/gm in the RCS for DE I-131, which is shown in column 6 of Attachment A – Table 1. The containment concentration is obtained by dividing the containment volume into the tota uCi/gm released to containment (column 8 of Table 1). The corresponding dose rates are then determined by multiplying the mR/hr per uCi/cc conversion factors from the ODCM. This gives us a calculated dose rate of 2.66E+01 R/hr for a release at maximum TS allowable coolant activity levels.

Calculation based on Core Total Fission Products

Core total fission product activities are obtained from USAR Table D.1-1 as updated for the Stretch Power Uprate. Dose equivalent factors are obtained from ODCM, Table 2.1 for the noble gases, and TS 1.p (definition section) for the dose equivalent I-131 factors. The product of these 2 values gives the total core dose equivalent activity (column 4 of Attachment A – Table 2). Then, the percent core activity in the GAP is given based on the gap fractions given in column 5. Reg Guide 1.183 gives values for use which are much higher than the values used here (1.0 noble gases, 0.4 halogens). A more conservative estimate of the dose is obtained using the assumed values in 3.1.2 above. The total curie

KEWAUNEE NUCLEAR POWER PLANT CALCULATION/EVALUATION CALC/EVAL NO. REV. PAGE NO. C11617 0 Page 3

in the gap space is then determined by multiplying the total core dose equiv. Activities by the release fractions (column 6, Table 2). This total cuies in the gap space is then multiplied by 300 and divided by the DE I-131 in RCS to get the total dose equivalent Ci in the gap space normalized to 300 uCi/ml. This number is divided by the containment volume to get the total normalized activity (to 300 uCi/ml) released to containment (RCS into containment) during the LOCA (column 8, Table 2). The corresponding dose rates are then determined by multiplying the mR/hr per uCi/cc conversion factors from the ODCM. This gives us a calculated dose rate of 9.89E+02 R/hr representing 5% clad failure. To obtain the 20% clad failure value, the 9.89E+02 R/hr (approximately 1000 R/hr) is multiplied by 4 to get 4000 R/hr.

## 6.0 CALCULATION AND RESULTS

Refer to Attachment 1 for all calculated values.

Based on the calculation, the following R-40 and R-41 values are obtained:

TS Coolant Activity Limit Release:

2.66E+01 R/hr, rounded to 30 R/hr.

5% Clad Damage:

9.89E+02 R/hr, rounded to 1000 R/hr.

20% Clad Damage:

4000 R/hr

## 7.0 CONCLUSIONS AND RECOMMENDATIONS

In conclusion, the following values are recommended to be used for the EALs: EAL #4 (30 R/hr), EAL #5 (1000 R/hr), and EAL #6 (4000 R/hr).

and the second second

Attachment A - Table 1

### **50.59 APPLICABILITY REVIEW**

(Is the activity excluded from 50.59 review?)

Document/Activity number: CI1619, Revision 0

1. 2.

3.

Brief description of proposed activity (what is being changed and why):

Calculation to determine cavity level that would result in uncovering a fuel assembly.

Does the proposed activity involve or change any of the following documents or processes? Check YES or NO for EACH applicability review item. Explain in comments if necessary. [Ref. NMC 50.59 Resource Manual, Section 4]

NOTE: If you are unsure if a document or process may be affected, contact the process owner.

Calc. C11619, Rev. 0

#### **Determination of Cavity Level for EAL RA2.2**

#### 1.0 Purpose/Background

This calculation is to support the conversion of KNPP current EAL (Emergency Action Levels) to the NEI 99-01, Rev. 4 scheme. Per the new EAL RA2.2, a calculation is needed to indicate the reactor cavity Level that would result in uncovering an irradiated fuel assembly outside the reactor vessel. This value represents the maximum height the fuel could be during refueling. This value is bounding and conservative for all conditions.

2.0 Inputs/Assumptions/Methodology/Acceptance Criteria

2.1 Inputs: Dwg. XK-113557-5, Rev. D1, Operations Procedure N-RHR-34C, Rev. N

2.2 Assumptions: None

2.3 Methodology:

Per manipulator crane drawing XK-113557-5, the top of a fuel assembly with the gripper tube assembly fully retracted is at a plant elevation of 638'7". Per Operations Procedure, N-RHR-34C, RHR Operation At A Reduced Inventory Condition:

Reactor cavity at 0% (612'4" elevation = 200 INWC (inches water column)) Range is 200 to 850 INWC (1% is equal to 6.5 INWC). Therefore:

638' 7" <u>-612' 4"</u> 26' 3" or 315 inches

315"

650 (inch span) = 48.46% or  $315" \times (\%/6.5") = 48.46\%$ 

For EAL RA2.2, the value will be rounded conservatively to 50%.

2.4 Acceptance Criteria: None.

#### 3.0 References/Calculation Results/Recommendations

Per references (XK-113557-5 and N-RHR-34C), the calculated value of 48.46% will be conservatively rounded up to 50%. So with reactor vessel level greater than 50%, a fuel assembly will not be exposed even at its highest elevation during refueling operations.

[These indications are taken from Rx Vessel Level sightglass and Reactor Cavity Level (LI-41337/LT-24068).]

Revision

n

#### Verification Items

Purpose

- Clear objective and problem statement
- Affected SSC been identified
- Intended use of results been identified
- Any limitation of applicability
- Revision content been summarized

#### Methodology

- Discussion of the method/approach and major steps
- Limitation of use of methodology identified

#### Acceptance Criteria

- Clear definition of acceptance criteria
- Exceptions clearly defined
- Sources of acceptance criteria clearly defined

#### Assumptions

- Sufficient rationale to permit verification of assumption
- Have unverified assumptions been identified as such
- References provided for assumptions.

#### Inputs

- All applicable Design Inputs been identified Has source document for inputs been identified
- Computer data program SQA approval

#### References

- Have all controlled plant input documents been identified
- If a procedure is cited, has the process owner been notified
- Are references available from KNPP records, or have they been attached

#### Calculation and Results

- Correct formula/method used to support the objective
- Formula variables (including units) clearly labeled and consistent with sources
- Computer program input/output been reviewed
- Reference to sketches provided
- Sufficient bases/rational to permit verification of engineering judgment Proper carry over and use of significant digits

#### Conclusions and Recommendations

- Clear statement of the results consistent with the objective
- Acceptability of the results clearly defined
- Recommendation for unacceptable results, AR written if necessary
- Clear definition of limitations or requirements imposed by the calculation
- necessary to maintain the validity of the results
- Have the effects of the calculation on output documents been identified and addressed

### **50.59 APPLICABILITY REVIEW**

(Is the activity excluded from 50.59 review?)

Document/Activity number: C11620, Rev. 0

1. 2.

3.

Brief description of proposed activity (what is being changed and why):

Evaluation of RASCAL runs to review emergency action levels based on radiological effluent release from the plant.

Does the proposed activity involve or change any of the following documents or processes? Check YES or NO for EACH applicability review item. Explain in comments if necessary. [Ref. NMC 50.59 Resource Manual, Section 4]

NOTE: If you are unsure if a document or process may be affected, contact the process owner.

### 50.59 PRE-SCREENING

(is a 50.59 screening required?)

Document/Activity number: C11620, Rev. 0 1. Brief description of proposed activity (what is being changed and why): 2.

necessary

3.

Evaluation of RASCAL software runs demonstrating dose rates seen at site boundary under varying effluent releases from the site.

Does the proposed activity involve or change any of the following documents or processes? Explain in Comments if necessary.

Check YES or NO for EACH pre-screening item. [Ref. NMC 50.59 Resource Manual, Section 5.1] NOTE: If you are unsure if a document or process may be affected, contact the process owner.

NOTE: An asterisk (\*) indicates that the document is incorporated by reference in the USAR or is implicitly considered part of the USAR.

NOTE: Check NO if activity/change is considered editorial, administrative, or maintenance as defined in Attachments A, B, and C. Explain in Comments if

FPP-08-09 Temporary plant alterations - Check YES only if not associated with maintenance. w  $\boxtimes$ Corrective/Compensatory Actions - Check YES only if degraded/non-conforming plant condition accepted "as-is" or X GNP-11.08.03  $\boxtimes$ compensatory action taken. 4.

Conclusion. Check one of the following:  $\boxtimes$ 

All of the documents or processes listed above are checked NO. A 50.59 screening is NOT required. Process change in accordance with the applicable program/process/procedure.

One or more of the documents or processes listed above are checked YES. A 50.59 screening shall be performed.

5. Comments

This evaluation does not affect a methodology, method of evaluation described in USAR and also does not affect design or licensing basis. Print name followed by signature. Either the preparer or reviewer shall be 50.59 screening qualified. Attach completed form to document/activity/change package 6.

#### KEWAUNEE NUCLEAR POWER PLANT CALCULATION/EVALUATION

CALC/EVAL NO. REV. PAGE NO. C11620 0

#### 1.0 Purpose

The purpose of this evaluation is to review the data obtained from runs of RASCAL for various release conditions from the plant. This data will input to settings of the new Emergency Action Levels (EAL)s that are being established as a part of an ongoing NMC effort to have all plants in compliance with NEI 99-01, Rev. 4, "Methodology for Development of Emergency Action Levels."

#### 2.0 Background

Data has been provided from RASCAL for abnormal radiological levels associated with radiological effluent. There are 2 such EALs that RASCAL runs have been performed. The first is AS1 which is an initiating condition for a Site Area Emergency. This is defined as "Offsite dose resulting from an actual or immiment release of gaseous radioactivity exceeds 100 mR TEDE or 500 mR Thyroid CDE for the actual or projected duration of the release." Dose assessment using actual meteorology indicates doses greater than 100 mR TEDE or 500 mR thyroid CDE at or beyond the site boundary.

The second is AG1 which is an initiating condition for a General Emergency. This is defined as "Offsite dose resulting from an actual or imminent release of gaseous radioactivity exceeds 1000 mR TEDE or 5000 mR Thyroid CDE for the actual or projected duration of the release using actual meteorology." Dose assessment using actual meteorology indicates doses greater than 1000 mR TEDE or 5000 mR Thyroid CDE at or beyond the site boundary.

These 2 initiating conditions were simulated with data in RASCAL for 4 release pathways on site: through the Auxiliary Building Stack, Containment Stack, Steam Line Steam Generator Safeties, or Steam Line PORVs.

#### **3.0** Inputs and Assumptions

Anticipated values were input into RASCAL such to obtain the desired values at the site boundary. Average wind speeds, direction, and stability are assumed to be as stated in USAR Section 2.7.2.

#### 4.0 Methodology and Acceptance Criteria

Runs were performed with the RASCAL software. This is an NRC approved code for use in emergency preparedness. There is no formal acceptance criteria for this evaluation.

#### KEWAUNEE NUCLEAR POWER PLANT CALCULATION/EVALUATION

#### CALC/EVAL NO. REV. PAGE NO.

C11620 0 3

Evaluation of this data reveals the appropriate step change in radiological results for a corresponding step change in either counts or dose rates. Increase in classification from AS1 to AG1 has the corresponding x10 increase in both source release values and dose rates at the boundary.

### 7.0 Conclusions and Recommendations

The results from RASCAL appear reasonable and are representative of what would be expected with the release rates used. It is recommended that the RASCAL runs be used in the development of the EALs for Kewaunee.

Notes: 1. Doses exceeding PAGs are underlined. 2. Early-Phase PAGs: TEDE - 1 rem, Thyroid CDE - 5 rem 3. \*\*\* indicates values less than 0.1 mrem To view all values - use Detailed Results | Numeric Table 4. Total EDE = CEDE Inhalation + Cloud Shine + 4-Day Ground Shine 5. Total Acute Bone = Bone Inhalation + Cloud Shine + Period Ground Shine

### **Case Summary**

| Event Type            | Nuclear Power Plant                 |
|-----------------------|-------------------------------------|
| Location              |                                     |
| Name:                 | Kewaunee                            |
| City, county, state:  | Carlton, Kewaunee, WI               |
| Lat / Long / Elev:    | 44.3431° N. 87.5361° W. 194 m       |
| Time zone:            | Central                             |
| Population (1990):    | 119 / 1,305 / 9,763 (2 / 5 / 10 mi) |
| Reactor Parameters    |                                     |
| Reactor power:        | 1772 MW(t)                          |
| Average fuel burn-up: | 22000 MWD / MTU                     |
| Containment type:     | PWR Dry Ambient                     |
| Containment volume:   | 1.30E+06 ft <sup>3</sup>            |
| Design pressure:      | 46 psig                             |
| Design leak rate:     | 0.50 %/d                            |
| Coolant volume:       | 3.21E+04 gal                        |
| Assemblies in core:   | 121                                 |
| Steam generator type: | U-Tube                              |
| <b>0</b>              |                                     |
|                       |                                     |
| Type:                 | Monitored Release - Mixtures        |
| Snuldown.             | NO                                  |
| Sample ID.            |                                     |
| Sample taken:         | 00/03/04 00:00                      |
| Gross concentration:  | 2 95F+00 uCi/cm <sup>3</sup>        |
| Elow rate:            | 2 20E+06 am3/a                      |

# CALCULATION VERIFICATION CHECKLIST

#### Calculation # C11622

Revision

#### Verification Items

# Purpose

٠

- Clear objective and problem statement
- Affected SSC been identified
- Intended use of results been identified
- Any limitation of applicability
- Revision content been summarized

#### Methodology

- Discussion of the method/approach and major steps
- Limitation of use of methodology identified

#### Acceptance Criteria

- Clear definition of acceptance criteria
- Exceptions clearly defined
- Sources of acceptance criteria clearly defined

#### Assumptions

- Sufficient rationale to permit verification of assumption
- Have unverified assumptions been identified as such
- References provided for assumptions

#### Inputs

- All applicable Design Inputs been identified
- Has source document for inputs been identified
- Computer data program SQA approval

#### References

- Have all controlled plant input documents been identified
- If a procedure is cited, has the process owner been notified
- Are references available from KNPP records, or have they been attached

Calculation and Results

- Correct formula/method used to support the objective
- Formula variables (including units) clearly labeled and consistent with sources
- Computer program input/output been reviewed
- Reference to sketches provided
- Sufficient bases/rational to permit verification of engineering judgment
- Proper carry over and use of significant digits

#### Conclusions and Recommendations

- Clear statement of the results consistent with the objective
- Acceptability of the results clearly defined
- Recommendation for unacceptable results, AR written if necessary
- Clear definition of limitations or requirements imposed by the calculation necessary to maintain the validity of the results
- Have the effects of the calculation on output documents been identified
  - and addressed

# **50.59 APPLICABILITY REVIEW**

(Is the activity excluded from 50.59 review?)

Document/Activity number: C11622, Rev. 0

1.

2.

3.

Brief description of proposed activity (what is being changed and why):

Calculate a rough approximation of dose levels seen at rad monitor R-2 if fuel were uncovered.

Does the proposed activity involve or change any of the following documents or processes? Check YES or NO for EACH applicability review item. Explain in comments if necessary. [Ref. NMC 50.59 Resource Manual, Section 4]

NOTE: If you are unsure if a document or process may be affected, contact the process owner.

**INFORMATION USE** 

# **50.59 PRE-SCREENING**

(is a 50.59 screening required?)

Document/Activity number: C11622, Rev. 0 Brief description of proposed activity (what is being changed and why):

1. 2.

3.

This calculation is a rough estimate of dose levels expected if a single fuel assembly were to become uncovered while seated in the reactor

Does the proposed activity involve or change any of the following documents or processes? Explain in Comments if necessary.

Check YES or NO for EACH pre-screening item. [Ref. NMC 50.59 Resource Manual, Section 5.1]

NOTE: If you are unsure if a document or process may be affected, contact the process owner.

NOTE: An asterisk (\*) indicates that the document is incorporated by reference in the USAR or is implicitly considered part of the USAR.

NOTE: Check NO if activity/change is considered editorial, administrative, or maintenance as defined in Attachments A, B, and C. Explain in Comments if necessary.

# 1.0 PURPOSE

The purpose of this calculation is to determine the appropriate values for initiation of Emergency Action Levels (EALs) associated with loss of RPV Inventory affecting core decay heat removal capability with irradiated fuel in the RPV. (EAL: CS2 and CG1) In particular, this calculation will support leaving the containment area radiation monitor, R-2, at its current alarm setting of 100 mR/hr for the high alarm setting and proving that the readings on the refueling elevation with a single fuel assembly exposed will result in a dose rate of at least 100 mR/hr at the location of the detector (R-2).

# BACKGROUND

2.0

4.0

Kewaunee Nuclear Power Plant (KNPP) is performing an EAL Upgrade Project. As a part of this project, there will be new values used for the action level settings associated with the containment radiation monitors. It was requested to determine a "rough estimate" of the dose rates that would be seen on the refueling elevation if there were a complete loss of inventory during refueling such that the tops of the fuel assemblies were exposed.

## 3.0 INPUTS AND ASSUMPTIONS

Inputs:

3.0.1 USAR Table D.3-2, as amended for the Power Uprate

#### Assumptions:

3.1.1 A single fuel assembly provides the bounding value for the minimum alarm value.

3.1.2 The dose rate from the single fuel assembly will be treated as a point source.

3.2.3 It is assumed that R-2 provides a more direct "line-of-sight" to the gamma dose than R-40 and R-41 which are located behind the steam generator vaults. R-2 is located near the personnel hatch (to the left as one enters containment) and mounted on a pipe next to the outer wall.

3.2.4 It is assumed that there will be at least 100 hours prior to a fuel assembly being exposed since Technical Specifications (TS 3.8.a.3) require 148 hours prior to fuel movements.

3.2.5 It is assumed that even though there will be some shielding from the point source from the cavity walls, that sufficient "shine" exists in containment such that this rough approximation is within reason.

3.2.6 100% of the disintegrations produce a 0.8 MeV photon. Gamma abundance is 1.

# METHODOLOGY AND ACCEPTANCE CRITERIA

The method for obtaining the values is as follows:

The total curies that are contained in a fuel assembly as analyzed for the fuel handling accident are given in USAR Table D.3-2. The sum of these nuclide values is 1.18E+06 Ci. This will be used for the activity of the one fuel assembly assumed in the core for the

#### KEWAUNEE NUCLEAR POWER PLANT CALCULATION/EVALUATION

CALC/EVAL NO. REV. PAGE NO.

purposes of this calculation. There is no formal acceptance criteria for this calculation.

# 6.0 CALCULATION AND RESULTS

Reference 5.2, page 13, gives a rule of thumb for gamma rays. It states "for point sources with energies between 0.07 and 4 MeV, the exposure rate in roentgens per hour at 1 ft is given within 20% by 6 CEN, where C is the number of curies, E is the average gamma energy per disintegration in MeV, and N is the gamma abundance." It also goes on to show an average gamma energy is 0.8MeV. For simplification, we will use assumption 3.2.6 above (i.e. N=1.0).

So, if we input the KNPP values into the equation, we get:

GA (R/hr @ 1 ft.) = 6CEN = 6 x 1.18E+06 Ci x 0.8 MeV (1.0) = 5.66E+06 R/hr @ 1 ft.

Continuing, reference 5.2, page 39, gives the calculated exposure rate (X) from a point source as:

 $X (R/hr) = GA/r^2$ 

G = specific gamma ray constant (R/hr @ 1 meter per Ci) A = activity of source in curies

r = distance from the source in meters

Per references 5.3 and 5.4, there is an approximate linear 81.5 ft between the top of fuel and the R-2 detector (35.5 ft vertical and 46 ft horizontal). This corresponds to 81.5/3.2808 = 24.84 meters.

Solving for X (R/hr) gives:

5.66E+06 R/hr / (24.84 m)<sup>2</sup> = 9.18E+03 R/hr.

KEWAUNEE NUCLEAR POWER PLANT CALCULATION/EVALUATION

7.0

# CONCLUSIONS AND RECOMMENDATIONS

In conclusion, based on the rough estimate shown above, there is confidence that there will be at least 100 mR/hr as seen by R-2 if there was fuel uncovered in the core during refueling. The estimated value of 9.18E+03 R/hr may be reduced somewhat due to shielding of the cavity walls, but a radiation shine would exist in the containment from the source and add to the overall dose. A more rigorous approach would use a direct line of sight to the detector, account for all the shielding between the floor and walls of the cavity, and estimate a total value for shine coming from within the containment building. This calculation was meant to merely provide a rough estimate of rad levels on the refueling elevation.

REV. PAGE NO. C1162

Page :

It is recommended that the existing 100 mR/hr High Alarm Setpoint for Radiation Monitor R-2 would make a very conservative setting for the loss of RPV inventory EALs. Based on the large amount of radiation that would be seen from such an event, this R-2 alarm would provide an early warning for emergency actions associated with the loss of reactor inventory.

## USAR Chapter 14 Safety Analysis

USAR Chapter 14 includes information related to transient and accident safety analysis. In a NRC evaluation dated December 2, 1998, approving Technical Specification (TS) Amendment No. 142, the NRC reviewed and found acceptable changes to support Cycle 23 fuel and reload in the following areas: mechanical analyses of the design of Siemens Power Corporation (SPC) Heavy fuel, analytical methods for transient and accident analyses, departure from nucleate boiling ratio (DNBR) limits, transient and LOCA analyses, and the associated Technical Specification changes. USAR Chapter 14 was updated to incorporate these changes, as well as other previously approved changes, administrative changes, and numerous editorial changes. Many of the changes were identified during the USAR Assessment Project reviews. Specific changes included the following:

USAR Sections 14.0, 14.1, 14.2 [UCR #98-039] - Format changes included creating a new Section 14.0 containing general safety analysis overview, inputs, and assumptions, previously included in Section 14.1. Various other clearly administrative changes were made. In addition, Sections 14.1 and 14.2 were updated to reflect Cycle 23 changes to the transient and accident analysis.

USAR Section 14.2.7, Page B.9-4 [UCR:#98-038] - This change deleted Section 14.2.7, "Turbine Missile Damage to Spent Fuel Pool," and removed this analysis from the KNPP licensing basis. This change was approved by the NRC in TS Amendment No. 142.

USAR Section 14.3.1 [UCR #98-035] - This change updated the Small Break LOCA information to reflect model changes previously reported under 10 CFR 50.46 (the analysis did not change). Also, changes due to Cycle 23 fuel design changes were incorporated.

USAR Section 14.3.2 [UCR #98-034] - This change replaced Section 14.3.2 in its entirety to incorporate the new large break loss of coolant accident (LBLOCA) analysis provided by Westinghouse. The analysis used an emergency core cooling system (ECCS) evaluation model that included the effects of low pressure coolant injection to the upper plenum of the reactor vessel (UPI). The changes were reviewed by the NRC in conjunction with TS Amendment No. 142. The major change in the analysis was the transition from SPC 14x14 Standard Fuel Assemblies to the SPC Heavy Fuel design. Additionally, the Nomimal calculation was not performed since this was not the first time application; only the Appendix K and Superbounded calculations were required to be performed. The results of the analysis satisfied the acceptance criteria of 10 CFR 50.46.

Previously approved changes included UCR #98-029 / KAP 2011 [USAR Page 14.1-50 and Table 14.1.10-1]. This change removed references to the Westinghouse natural circulation model for the loss of power to Reactor Coolant Pump transient. In 1988, the NRC had reviewed and accepted WPSC Reload Safety Evaluation methodology which superseded the Westinghouse methodology.

Smaller columns, when impacted on top, are expected to fail by limited crushing and plastic deformation, but continue to furnish support. Columns impacted on the side by flying or ricochetting turbine missiles are not expected to stand.

# **B.9.4 CONCLUSIONS**

sand square

Insert

W W

The previous discussion has shown that the concrete Shield Building, although sustaining localized damage as a result of the turbine missile, provides complete protection for the Reactor Containment Vessel. Integrity of the Reactor Containment Vessel is therefore not jeopardized by any credible turbine missile.

The Auxiliary Building, Screenhouse, and Class I areas of the Turbine Building are all contained in concrete structures having thicknesses of 10 inches or more. Although these structures could sustain some damage and deformation, it is expected that any turbine missile would be retained in a membrane of reinforcing. The vast majority of Class I equipment is located below the operating floor of the Auxiliary Building, which means there are multiple barriers of heavily reinforced concrete protecting this equipment from potential turbine missiles.

In summary, it is concluded that the Kewaunce plant is adequately protected against credible turbine missiles. The great majority of equipment is totally protected from missiles. Although the spent fuel pool is not completely turbine missile proof, its vulnerability to a turbine missile is so remote as to require no further design consideration.

This position is consistent with the regulatory guidance provided in the Standard Review Plan (NUREG-0800, Rev.2) that states the risk from a high trajectory missile is insignificant unless the vulnerable target area is on the order of 10<sup>4</sup> square feet or more. The surface area of the Kewaunee spent fuel pools is an order of magnitude less than this guidance value.

#### UNITED STATES NUCLEAR REGULATORY COMMISSION WASHINGTON, D.C. 200001

December 2, 1998

Mr. M. L. Marchi Site Vice President-Kewaunee Plant Wisconsin Public Service Corporation P.O. Box 19002 Green Bay, WI 54307-9002

### SUBJECT: AMENDMENT NO. 142-TO FACILITY OPERATING LICENSE NO. DPR-43 -KEWAUNEE NUCLEAR POWER PLANT (TAC NO. MA1557)

Dear Mr. Marchi:

The U.S. Nuclear Regulatory Commission has issued the enclosed Amendment No. 142 to Facility Operating License No. DPR-43 for the Kewaunee Nuclear Power Plant. This amendment revises the Technical Specifications in response to your application dated April 15, 1998, as supplemented by letters dated July 27, 1998, August 13, 1998, two different letters dated September 28, 1998, and by letter dated November 24, 1998.

The amendment revises the power distribution peaking factor limits and limits operating parameters related to the Minimum Departure from Nucleate Boiling Ratio (MDNBR) in support of Cycle 23 fuel and reload changes. A change associated with the fuel and reload changes, is the removal, from the current licensing basis, of the fuel pool turbine missile hazards analysis.

As proposed in your letter dated November 24, 1998, the amendment conditions the license for a maximum rod average burnup of 60 GWD/MTU, for any rod, until such time as the staff has completed an environmental assessment supporting a greater limit.

A copy of the Safety Evaluation is also enclosed. Notice of Issuance will be included in the Commission's next regular biweekly <u>Federal Register</u> notice.

Sincerely,

William U. F

William O. Long, Senior Project Manager Project Directorate III-1 Division of Reactor Projects III/IV Office of Nuclear Reactor Regulation

Docket No. 50-305

Enclosures: 1. Amendment No. 142 to License No. DPR-43 2. Safety Evaluation

cc w/encls: See next page

## 2.1.3 CONCLUSION REGARDING REVISED PEAKING FACTOR LIMITS

The staff has reviewed the licensee's reload application and the proposed TS changes with the supporting analyses to allow operations of Cycle 23 and future cycles at the KNPP plant. Based on this review, the staff concludes that the supporting safety analyses are acceptable, and the proposed TS changes adequately reflect the results of the acceptable supporting analyses and are, therefore, acceptable for reload applications.

& Opplicable pages

### 2.2.2 RADIOLOGICAL ASSESSMENT

Operation at higher peaking factors results in an increase in the total activity and associated gap activity of the limiting fuel assembly, but no increase in the corewide inventory of noble gases and halogens. Thus, the only accidents for which the calculated radiological consequences would be affected are the fuel handling accident inside containment and the fuel handling accident outside containment. The licensee provided a reanalysis of these events in conjunction with Amendment No. 132. Amendment No. 132 was issued on May 28, 1998, with a supplement dated September 3, 1998. The Amendment No. 132 evaluation bounds the effects of the new fuel and found the radiological consequences of fuel handling accidents to be acceptable. The staff finds that any postulated release and radiological doses from a large break loss of coolant accident are not affected by the proposed changes.

#### 2.2 TURBINE MISSILES HAZARDS ANALYSIS

## 2.2.1 LICENSEE'S REQUEST

General Design Criterion 4 requires that structures, systems, and components important to safety shall be appropriately protected against environmental and dynamic effects, including the effects of missiles, that may result from equipment failure. Because turbine rotors have large masses and rotate at relatively high speeds during normal reactor operation, failure of a rotor may result in the generation of high energy missiles potentially impacting and damaging safety related structures, systems and components.

Consistent with the staff's position taken on existing turbine rotor designs, the probability of turbine missile generation should be kept to no greater than 10<sup>5</sup> per reactor-year (RY) for an unfavorably oriented turbine and 10<sup>4</sup> per RY for a favorably oriented turbine.

The Kewaunee Nuclear Power Plant (KNPP) has an unfavorable turbine generator placement and orientation, and the plant is committed to keep the probability of turbine missile generation to no greater than 10<sup>-5</sup> per reactor-year.

On April 15, 1998, Wisconsin Public Service Corporation (hereafter referred to as the licensee) submitted Proposed Amendment 152 to the KNPP technical specifications (TS). The purpose of the amendment was to document improvements realized by the new fuel design and reflect changes to the KNPP conditions. The amendment also proposes the elimination of high trajectory turbine missiles as a design event impacting the spent fuel. On July 27, 1998, the licensee provided additional information to justify the removal of high trajectory turbine missiles as a design event fuel.

The proposed amendment would change the KNPP Technical Specifications to document improvements realized by the new fuel design and reflects changes to the KNPP operating conditions. It also proposes the elimination of high trajectory turbine missiles as credible design events impacting the spent fuel.

00

The licensee's basis for proposing an amendment to eliminate high trajectory turbine missile as a design event impacting spent fuel is:

The Kewaunee USAR identifies the potential for a high trajectory turbine missile to damage fuel assemblies stored in the spent fuel pool. Because of the loss of energy in perforating through intervening walls and barriers and the travel distance after penetration, the probability of low trajectory missiles striking the spent fuel pool is negligible. Although acknowledged as low probability, the high trajectory analysis identifies the potential for 12 assemblies to be impacted by a turbine missile with the subsequent release of the assemblies' gap activity.

Since initial licensing in 1973, additional NRC guidance has been developed for assessing the potential for, and consequences of, turbine missiles including NUREG-0800 and R.G. 1.115. This guidance states that the risk from a high trajectory missile is insignificant unless the vulnerable target area is on the order of 10<sup>4</sup> square feet or more. The Kewaunee spent fuel pool surface is approximately 10<sup>3</sup> or an order of magnitude below the guidance value.

Additionally, more detailed probabilistic studies have been completed by the turbine generator manufacturer on the likelihood of a turbine missile. This information was reviewed by the NRC as part of Technical Specification Amendment 121 establishing the frequency for turbine control and stop valve testing and established a performance requirement of  $10^{-5}$ /year as the probability of a turbine missile ejection. This is also consistent with the NRC guidance for an unfavorably oriented turbine-generator.

In conclusion, the probability of a turbine missile impacting the spent fuel is sufficiently low that this event and the associated radiological consequences are no longer required to be evaluated as design basis for the Kewaunee Plant.

## 2.2.2 EVALUATION AND CONCLUSION REGARDING TURBINE MISSILES

The NRC staff has reviewed the licensee's basis for proposing to eliminate the high trajectory turbine missile as a design event impacting spent fuel and finds it acceptable. This acceptance is based on staff positions stated in Standard Review Plan (SRP) 3.5.1.3, "Turbine Missiles" and review of the turbine manufacturer's methodology for assessing the probability of turbine missile generation. Paragraph III.5 of SRP 3.5.1.3 acknowledges that the probability of a high

trajectory turbine missile hitting targets is low (10<sup>-7</sup> per square foot of target area) and states that risk from high trajectory turbine missiles is insignificant unless the vulnerable target area is in the order of 10<sup>4</sup> square feet or more. The Kewaunee spent fuel pool surface is substantially less about 10<sup>3</sup> square feet.

-10

Based on its evaluation, the staff finds that amending the KNPP TS to eliminate consideration of high trajectory turbine missiles as a design event impacting spent fuel is acceptable. The staff concludes that the risk for the proposed modification of the plant TS is acceptable and meets the relevant requirements of GDC 4. This conclusion is based on the licensee having sufficiently demonstrated to the staff that the probability of turbine missile damage to structures, systems, and components important to safety is acceptably low and within the limits specified in SRP Section 3.5.1.3, "Turbine Missiles."

## STATE CONSULTATION

In accordance with the Commission's regulations, the Wisconsin State official was notified of the proposed issuance of the amendment. The State official had no comments.

# 4.0 ENVIRONMENTAL CONSIDERATION

Pursuant to 10 CFR 51.21, 51.32, and 51.35, an environmental assessment and finding of no significant impact has been prepared and published in the <u>Federal Register</u> on December 2, 1998 (63 FR 66589). Accordingly, based upon the environmental assessment, the Commission has determined that the issuance of this amendment will not have a significant effect on the quality of the human environment.

## 5.0 <u>CONCLUSION</u>

3.0

The Commission has previously issued a proposed finding that this amendment involves no significant hazards consideration and there has been no public comment on such finding (63 FR 25120).

The staff has concluded, based on the considerations discussed above, that: (1) there is reasonable assurance that the health and safety of the public will not be endangered by operation in the proposed manner, (2) such activities will be conducted in compliance with the Commission's regulations, and (3) the issuance of this amendment will not be inimical to the common defense and security or to the health and safety of the public.
