HTGR LICENSING AND REGULATION

RD:CR:HTR:EMG

Following a meeting held on January 24, 1961 at which matters pertaining to the Licensing and Regulation of the HTGR were discussed by representatives of the AEC and the Companies, Dr. Pittman requested me to furnish the Division of Licensing and Regulation with copies of HTGR progress reports and pertinent HTGR topical reports issued by GA Division.

In this connection please arrange to have GA Division furnish me with at least two (2) copies of all HTGR reports in the future. I am also requesting one (1) additional copy of each of the following topical reports which were issued by GA Division in the past:

1. Iodine Adsorption by Activated Charcoal at Low Partial Pressures, October 12, 1960.
2. The Noble Gas Permeability Characteristics of Graphite Materials for Use in Gas-Cooled Reactors, April 1960, GA-1361.
3. Boron Compounds for Use as Burnable Poisons, July 1, 1960, GAMD-1196.
4. Chemical Problems in Advanced Gas-Cooled Reactors, L. R. Zumwalt, General Atomic.

These reports will be furnished to the Division of Licensing and Regulation on an informal basis, in addition to and distinct from the information furnished by Philadelphia Electric as part of the licensing procedure, and will not become part of the public record.
