INDUSTRY GUIDELINE FOR

IMPLEMENTING PERFORMANCE-BASED

OPTION OF 10 CFR PART 50, APPENDIX J

October xx, 2005 Deleted: July 26, 1995

REVISION 1 TO INDUSTRY GUIDELINE FOR IMPLEMENTING PERFORMANCE-BASED OPTION OF 10 CFR PART 50, APPENDIX J

<u>October, xx, 2005</u>

Deleted: July 26, 1995

ACKNOWLEDGMENTS

This guidance document, <u>Industry Guideline for Implementing Performance-Based</u> Option of 10 CFR 50, Appendix J, NEI 94–01, <u>Revision 1</u>, was developed by the Nuclear Energy Institute (NEI) <u>Type A Integrated Leakage Rate Test Interval</u> <u>Extension</u> Task Force. We appreciate the direct participation of the many licensees who contributed to the development of the guideline and the participation of the balance of the industry <u>that</u> reviewed and submitted comments to improve the document clarity and consistency. The dedicated and timely effort of the many Task Force participants, including their management's support of the effort, is greatly appreciated.

NEI also wishes to express its appreciation to the Electric Power Research Institute (EPRI) who devoted considerable time and resources to the development of this <u>revised</u> industry Appendix J guideline.

NOTICE

Neither NEI, nor any of its employees, members, supporting organizations, contractors, or consultants make any warranty, expressed or implied, or assume any legal responsibility for the accuracy or completeness of, or assume any liability for damages resulting from any use of, any information apparatus, method, or process disclosed in this report or that such may not infringe privately owned rights.

ii

FOREWORD

The purpose of this guidance is to assist licensees in the implementation of Option B to 10 CFR 50, Appendix J, "Leakage Rate Testing of Containment of Light Water Cooled Nuclear Power Plants<u>" and in extending Type A Integrated Leak Rate</u> <u>Test (ILRT) surveillance intervals beyond ten years</u>.

In response to NRC data gathering inquiries, the industry collected, evaluated, and provided summary data that supported the NRC's independent data analysis<u>of</u> <u>NUREG-1493</u>. To support this 2005 revision, many licensees responded to an NEI request and provided pertinent leakage rate testing experience information covering the period from 1995 to 2005.

Deleted: Licensees can minimize the redundant and overlapping engineering and evaluation efforts associated with these related regulatory requirements by internal coordination. NEI will continue to monitor these and other activities to provide focus on opportunities for safety improvement and cost avoidance.¶

EXECUTIVE SUMMARY

This document describes an acceptable approach for implementing the optional performance-based requirements of Option B to 10 CFR 50, Appendix J<u>and for</u> <u>extending the Type A ILRT interval to up to fifteen years</u>. It delineates a performance-based approach for determining Type A, Type B, and Type C containment leakage rate surveillance testing frequencies. Justification of extending test intervals is based on the performance history and risk insights.

This guideline discusses the performance factors that licensees must consider in determining test intervals. It does not address how to perform the tests because these details can be found in existing documents (e.g., ANSI/ANS-56.81994). The performance criterion for Type A tests is a performance leakage rate (as defined in this guideline) of less than <u>1.0La</u>. Extension <u>of</u> Type A test intervals are allowed based upon two consecutive successful Type A tests and other requirements stated in Section 9.2.3 of this guideline. These additional requirements include supplemental inspections and a confirmatory plant-specific risk impact assessment. Type A testing shall be performed at a frequency of at least once per 15 years. If the Type A performance leakage rate is not acceptable, the performance criterion is not met, and a determination should be performed to identify the cause of unacceptable performance and determine appropriate corrective actions. Once completed, acceptable performance should be reestablished by demonstrating an acceptable performance leakage rate before resuming operation and by performing another successful Type A test within 48 months following the unsuccessful Type A test. Following these successful Type A tests, the surveillance frequency may be returned to at least once per 15 years. Extensions of Type B and Type C test intervals are allowed based upon completion of two consecutive periodic as-found tests where the results of each test are within a licensee's allowable administrative limits. Intervals for Type B and Type C may be increased from 30 months up to a maximum of 120 months (except for containment airlocks), or as specified in Regulatory Guide 1.163. If the Type B and C test results are not acceptable, the test frequency should be set at the initial test intervals. Once the cause determination and corrective actions have been

completed, acceptable performance may be reestablished and the testing frequency

returned to the extended intervals as specified in this document.

iv

The performance factors that have been identified as important and should be considered in establishing testing intervals include past performance, service, design, safety impact, and cause determination as described in Section 11.3.1.

If a licensee considers extended test intervals of greater than 60 months or three refueling cycles for Type B or Type C tested components, the review should include the additional considerations of <u>as</u>-found tests, schedule and review as described in Section 11.3.2.

Deleted: As

Finally, this document discusses the general requirements for recordkeeping for implementation of Option B to Appendix J.

Option B is a performance–based approach to Appendix J leakage testing requirements. This option, in concert with Regulatory Guide 1.163 and NEI 94-01, Revision 1, allows licensees with good ILRT performance history to reduce the Type A Integrated Leakage Rate Test (ILRT), frequency from three tests in 10 years to at least one test in 15 years. The initial 1995 relaxation of ILRT frequency was based on the NRC risk assessment contained in "Performance-Based Containment Leak-Test Program (NUREG-1493) and EPRI Risk Impact Assessment of Revised Containment Leak Rate Testing Intervals (TR-104285) both	Deleted: has Deleted: existing Deleted: Appendix Deleted: would allow Deleted: testing
$\begin{array}{c} 21 \\ 22 \\ 23 \\ 24 \\ 25 \\ 26 \\ 27 \\ 28 \\ 29 \\ 30 \\ 31 \\ 32 \\ 33 \\ 34 \\ 35 \\ 36 \end{array}$	Type C tests. The Type A test measures overall leakage rate of the primary reactor containment. Type B tests are intended to detect leakage paths and measure leakage for certain primary reactor containment penetrations. Type C tests are intended to measure containment isolation valve leakage rates. In 1995, the NRC amended the regulations to provide an Option B to the 10CFR50, Appendix J. Option B is a performance–based approach to Appendix J leakage testing requirements. This option, in concert with Regulatory Guide 1.163 and NEI 94-01, Revision 1, allows licensees with good ILRT performance history to reduce the Type A Integrated Leakage Rate Test (ILRT) frequency from three tests in 10 years to at least one test in 15 years. The initial 1995 relaxation of ILRT frequency was based on the NRC risk assessment contained in "Performance-Based Containment Leak-Test Program (NUREG-1493) and EPRI Risk Impact Assessment of Revised Containment Leak Rate Testing Intervals (TR-104285) both of which found that there was a very low increase in risk associated with increasing	Deleted: has Deleted: existing Deleted: Appendix Deleted: would allow Deleted: testing

 $\frac{2}{3}$

40	one-time ILRT interval extensions beyond ten years, and it was deemed appropriate	
41	to assess the risk involved in extending ILRT intervals beyond ten years. EPRI	
42	Product No. 1009325, Revision 1, "Risk Impact Assessment of Extended Integrated	
43	Leak Rate Testing Intervals" demonstrated that generically there is little risk	
44	associated with extension of ILRT intervals of up to fifteen years. However, plant-	
45	specific confirmatory risk impact assessments are required.	
46		
47	For Type B and Type C tests, Option B <u>, in concert with Regulatory Guide</u>	
48	1.163 and NEI 94-01, Revision 1 allows licensees to reduce testing frequency on a	- Deleted: would
49	plant-specific basis based on experience history of each component, and established	Deleted: allow
50	controls to ensure continued performance during the extended testing interval.	
51		
52	Generally, a FSAR describes plant testing requirements, including	
53	containment testing. In some cases, FSAR testing requirements differ from those of	
54	Appendix J. In many cases, Technical Specifications were approved that	
55	incorporated exemptions to provisions of Appendix J. Additionally, some licensees	
56	have requested and received exemptions after their Technical Specifications were	
57	issued. The alternate performance-based testing requirements contained in Option	
58	B of Appendix J will not invalidate such exemptions.	
59		
60	Plants that have elected to invoke 10CFR50, Appendix J, Option B in concert	
61	with NEI 94-01 (1995) and Regulatory Guide 1.163 (1995) and who do not wish to	
62	extend ILRT surveillance intervals beyond ten years are not required to comply	
63	with this current revision of NEI 94-01, Revision 1.	
64		
65	1.2 <u>Discussion</u>	
66		
67	This guideline describes an approach that may be used to meet the alternate	
68	testing requirements described in Option B to Appendix J. The performance history	
69	of containment, penetrations, and containment isolation valves is used as the	
70	means to justify extending test intervals for containment Type A, Type B, and Type	

71 C tests. This guideline provides a method for determining the extended test

72 intervals based on performance.

73
74 Under Option B, test intervals for Type A, Type B, and Type C testing may
75 be determined by using a performance–based approach. Performance–based test
76 intervals are based on consideration of operating history of the component and
77 resulting risk from its failure. Performance–based for Appendix J refers to both the
78 performance history necessary to extend test intervals as well as the criteria
79 necessary to meet the requirements of Option B. The performance–based approach

80 81	to leakage rate testing discussed in NUREG–1493, "Performance–Based Leak–Test Program," concludes that the impact on public health and safety due to extended	
82	intervals is negligible. EPRI Product No. 1009325, Revision 1, "Risk Impact	
83	Assessment of Extended Integrated Leak Rate Testing Intervals" concludes that	
84	reducing the frequency of Type A tests (ILRTs) from the current 3 per 10 years to 1	
85	per 15 years leads to a small increase in risk. The approach of the EPRI Risk	
86	Impact Assessment included compliance with appropriate current risk-informed	
87	guidance of Regulatory Guide 1.174 (1998), "An Approach for Using Probabilistic	
88	Risk Assessment in Risk-Informed Decisions in Plant-Specific Changes to the	
89	Licensing Basis."	Deleted: ¶
90	Type A tests focus on verifying the leakage integrity of a passive containment	Deleted: The objective for monitoring performance of
91	structure. Type B and C testing focuses on assuring that containment penetrations	Deleted: es
92	are essentially leak tight. <u>These tests collectively satisfy the requirements of</u>	Deleted: es
93	10CFR50, Appendix J, Option B summarized as follows: "These test requirements	
94	ensure that (a) leakage through these containments or systems and components	
95	penetrating these containments does not exceed allowable leakage rates specified in	
96	the Technical Specifications and (b) integrity of the containment structure is	
97	maintained during its service life."	
98 99	2.0 <u>PURPOSE AND SCOPE</u>	
100	This guideline describes an acceptable method for implementing the optional	
100	performance–based requirements of Appendix J. This method uses industry	
102	performance data, plant-specific performance data, and risk insights in	
103	determining the appropriate testing frequency. Licensees may elect to use other	
104	suitable methods or approaches to comply with Option B, but must obtain NRC	
105	approval prior to implementation.	
106		
107	The approach described in this guideline to implement Appendix J, Option B	
108	includes:	
109		
110	• Continued assurance of the leakage integrity of the containment without	
111	adversely affecting public health and safety;	
$111 \\ 112$	auversery affecting public fleatin and safety,	
113		Deleted: <#>Licensee flexibility to
114	• A framework to acknowledge good performance:	implement cost-effective testing
115	• A framework to acknowledge good performance	methods;¶
116	• Utilization of risk and performance–based methods, including an awareness	Deleted: ; and
117	of the plant-specific risk impact of extension of ILRT intervals of up to fifteen	
118	years;	Deleted:
119	<u>,</u>	
120	• An awareness of and attention to supplemental means of assessing and	Formatted: Bullets and Numbering
121	maintaining containment integrity, particularly for ILRT interval extensions	
I		

$122 \\ 123 \\ 124$	beyond ten years. Specifically, this includes the Maintenance Rule and ASME Boiler and Pressure Vessel Code, Section XI, Subsections IWE/IWL inspections and	
125	 Licensee flexibility to implement cost—effective testing methods. 	
126 127 128 129	This guideline delineates the basis for a performance–based approach for determining Type A, Type B, and Type C containment leakage rate surveillance testing frequencies. It does not address how to perform the tests because these data is printing demonstrate (a.g. ANGUANG 50.9, 1004)	
$\frac{130}{131}$	details can be found in existing documents (e.g., ANSI/ANS 56.8–1994).	Deleted: Licensees that select
132 133 134 135	3.0 <u>RESPONSIBILITY</u>	Option B are urged to coordinate the implementation of Appendix J, as described in this guideline, with their plans for implementation of the Maintenance Rule and other changes in the regulations as they are finalized.
$\frac{135}{136}$	Each licensee should determine if the requirements of the <u>initial Appendix J</u> (Option A) or the alternate requirements (Option B) are most appropriate for its	Deleted: existing
$130 \\ 137$	facility. If a licensee elects to implement the Option B requirements, the guidance	
138	described in this document has been reviewed and endorsed by the NRC as an	
139	acceptable method of implementing the requirements.	
140		
141	In addition, if a licensee elects to adopt Option B, it may elect to adopt the	
142	requirements that apply to a specific category of tests (i.e., Type A, or Type B and	
143	Type C tests) only.	
144		
145	Plants that have elected to adopt 10CFR50, Appendix J, Option B in concert	
146	with NEI 94-01 (1995) and Regulatory Guide 1.163 (1995) and who do not wish to	
147	extend ILRT surveillance intervals beyond ten years are not required to comply	
148	with this current revision of NEI 94-01, Revision 1.	
149		
150		
$\begin{array}{c} 151 \\ 152 \end{array}$	4.0 <u>APPLICABILITY</u>	
$153 \\ 154 \\ 155$	This guideline is applicable to licensees holding an operating license issued in accordance with 10 CFR 50.21(b) and 50.22, and 10 CFR Part 52, Subpart C.	
$156 \\ 156 \\ 157 \\ 158$	Industry operating experience and plant modifications that may affect Type A, Type B, and Type C testing program(s) should be reviewed to assure test and maintenance programs are appropriately adjusted to reflect these changes.	
159	5.0 <u>DEFINITIONS</u>	

1.01			
161	Definitions of <u>most</u> commonly accepted terms used in this guideline may be		
162	found in ANSI/ANS_56.8-1994. The following additional term and its definition is		Deleted:
163	used in this guideline:		
164			
165	• The performance leakage rate is calculated as the sum of the Type A	+	Formatted: Bullets and Numbering
166	<u>upper confidence limit (UCL) and as–left minimum pathway leakage rate</u>		
167	<u>(MNPLR) leakage rate for all Type B and Type C pathways that were in</u>		
168	service, isolated, or not lined up in their test position (i.e., drained and		
169	vented to containment atmosphere) prior to performing the Type A test. In		
170	addition, leakage pathways that were isolated during performance of the		
171	test because of excessive leakage must be factored into the performance		
172	determination.		
173			

 $\mathbf{5}$

174 6.0 <u>GENERAL REQUIREMENTS</u>

179		
176	Option B of 10 CFR 50, Appendix J states; <u>"Type A tests to measure the</u>	D
177	containment system overall integrated leakage rate must be conducted under	
178	conditions representing design basis loss-of-coolant accident containment peak	
179	pressure. A Type A test must be conducted (1) after the containment system has	
180	been completed and is ready for operation and (2) at a periodic interval based on	
181	the historical performance of the overall containment system as a barrier to fission	
182	product releases to reduce the risk from reactor accidents. A general visual	
183	inspection of the accessible interior and exterior surfaces of the containment system	
184	for structural deterioration which may affect the containment leak-tight integrity	
185	must be conducted prior to each test, and at a periodic interval between tests based	
186	on the performance of the containment system. The leakage rate must not exceed	
187	the allowable leakage rate (La) with margin, as specified in the Technical	
188 189	Specifications. The test results must be compared with previous results to examine the performance bistory of the evently containment system to limit lookage."	
	the performance history of the overall containment system to limit leakage."	D
190	x/	w cc
191	A review of leakage rate testing experience indicates that only a small	in
192	percentage of Type A tests have <u>exhibited</u> excessive leakage. Furthermore, the	cc al
193	observed leakage rates for the few Type A test failures were only marginally above	bı (L
194	current limits. These observations, together with the insensitivity of public risk to	ca
195	containment leakage rate at these low levels, suggest that for Type A tests,	ec in
196	intervals may be established based on performance. <u>The Type A test is the primary</u>	co ba
		10
197	means to detect containment leakage that is not detectable by the Type B and Type	le is
198	C testing programs, and <u>is also used</u> to verify at periodic intervals the accident	\ T
199	leakage (L _a) assumptions in the accident analysis.	
200		
201	An LLRT is a test performed on Type B and Type C components. An LLRT is	
202	not required for the following cases:	th

Deleted: Specific details of Type A test requirements are discussed in ANSI/ANS 56.8–1994.

214 215 216 217 218 219 220 221	For Type B and Type C tests, intervals shall be established based on the performance history of each component. Performance criterion for each component is determined by designating an administrative leakage limit for each component in the Type B and Type C testing program. The acceptance criteria for Type B and Type C tests is based upon demonstrating that the sum of leakage rates at DBA pressure for containment penetrations and valves that are testable, is less than the total allowable leakage rate specified in the plant Technical Specifications.
222	Primary containment barriers sealed with a qualified seal system shall be
223	periodically tested to demonstrate their functionality in accordance with the plant
224	Technical Specifications. Specific details of the testing methodology and
225	requirements are contained in ANSI/ANS 56.8–1994 and should be adopted by
226	licensees with applicable systems. Test frequency may be set using a performance
227	basis in a manner similar to that described in this guideline for Type B and Type C
228	test intervals. Leakage from containment isolation valves that are sealed with a
229	qualified seal system may be excluded when determining the combined leakage rate
230	provided that:
231	
232 233 234 235	• Such valves have been demonstrated to have fluid leakage rates that do not exceed those specified in the technical specifications or associated bases, and
236	• The installed isolation valve seal-water system fluid inventory is
237	sufficient to assume the sealing function for at least 30 days at a pressure
238	of 1.10 Pa.
239	
240

328		running summation of the leakage faces.		

329 9.0 DETERMINING PERFORMANCE-BASED TEST INTERVAL FOR 330 TYPE A TESTS

331

332 9.1 Introduction

333		
334	Determination of the surveillance frequency of Type A tests is based upon	
335	satisfactory performance of leakage tests that meet the requirements of Appendix J.	
336	Performance in this context refers to both the performance history necessary to	
337	determine test intervals as well as overall criteria needed to demonstrate leakage	
338	integrity performance. Performance is also used as a basis for demonstrating	
339	negligible impact on public health and safety.	
340		
341	The purpose of Type A testing is to verify the leakage integrity of the	
342	containment structure. The primary performance objective of the Type A test is not	
343	to quantify an overall containment system leakage rate. The Type A testing	
344	methodology as described in ANSI/ANS_56.8–1994, and the modified testing	Deleted:
345	frequencies recommended by this guideline, serves to ensure continued leakage	
346	integrity of the containment structure. Type B and Type C testing assures that	
347	individual penetrations are essentially leak tight. In addition, aggregate Type B	
348	and Type C leakage rates support the leakage tightness of primary containment by	
349	minimizing potential leakage paths. A review of performance history has concluded	
350	that <u>almost all</u> containment leakage is identified by local leakage rate testing.	Deleted: most,
351		Deleted: if not all,
352	This section discusses a method to determine a testing frequency for Type A	
353	testing based on performance. The extended test interval is based upon industry	
354	performance data that was compiled to support development of Option B to	
355	Appendix J, and is intended for use by any licensee. In adopting extended test	
356	intervals recommended in this guideline, a licensee should perform Type A testing	
357	in accordance with recommended industry practices. Additional technical	
358	information concerning data analysis may be found in NUREG–1493 <u>and EPRI</u>	
359	Product No. 1009325, Revision 1, "Risk Impact Assessment of Extended Integrated	
360	Leak Rate Testing Intervals",	Deleted: .
361		
362	Consistent with standard scheduling practices for Technical Specifications	
363	Required Surveillances, intervals for recommended Type A testing given in this	
364	section may be extended by up to 15 months. This option should be used only in	Deleted:
365	cases where refueling schedules have been changed to accommodate other factors.	
366		
$\frac{367}{368}$	9.1.1 Performance Criteria	
368 369	Performance criteria for establishing Type A test intervals should provide	
000	i di controlla del controlla del controllaria i specificazioni del controlla del contr	

both the standard against which performance is to be measured and basis for
determining that performance is acceptable. Because of the performance-based
emphasis on Type A testing, the criteria to determine extended Type A test

387 the performance criteria are not met.	Deleted:
388 Performance criteria do not include addition of the positive differences	Deleted: ¶
between the <u>as</u> -found MNPLR and the <u>as</u> -left MNPLR for each pathway tested and	Deleted: As
adjusted prior to Type A testing (total leakage savings). Total leakage savings are	Deleted: As
identified through performance of Type B and Type C testing and do not contribute	
392 significantly to performance of a Type A test. Failure of Type B and Type C test	
components found during performance of a Type A test should be reviewed for cause	
determination and corrective actions. If the pathway leakage cannot be determined	
395 by local leakage rate testing, the Type A performance criteria are not met.	
396	
397	
398 9.1.2 Test Interval	
399	
400 Extensions in test intervals are allowed based upon two consecutive, periodic	
401 <u>successful</u> Type A tests and <u>requirements stated in Section 9.2.3 of this guideline.</u>	Deleted: consideration of
The elapsed time between the first and the last tests in a series of consecutive	performance factors as described in Section 11.3, "Plant-Specific Testing
403 passing tests used to determine performance shall be at least 24 months.	Program Factors."
404	
405 9.2 <u>Type A Test</u>	
406	
407 9.2.1 Pretest Inspection and Test Methodology	
409 Prior to initiating a Type A test, a visual examination shall be conducted of	
410 accessible interior and exterior surfaces of the containment system for structural	Dolotodi which
411 problems that may affect either the containment structure leakage integrity or the	Deleted: which
412 performance of the Type A test. This inspection should be a general visual	

414 and components. <u>It is recommended that these inspections be performed in</u>	
415 conjunction or coordinated with the ASME Boiler and Pressure Vessel Code, Section	
416 XI, Subsection IWE/IWL required examinations.	
417	
418 ANSI/ANS: 56.8–1994 testing methodology states that pathways open to the	eleted:
419 primary containment atmosphere under post–DBA conditions shall be drained and	eleted: 1994 testing
420 vented to the primary containment atmosphere during a Type A test. There are	
421 three exceptions discussed in ANSI/ANS 56.8–1994 that allow penetrations to be	
422 tested under the LLRT program and the results added to the Type A leakage rate	
423 Upper Confidence Limit (UCL). One exception states that pathways in systems	
424 that are required for proper conduct of the Type A test or to maintain the plant in a	eleted: which
425 safe condition during the Type A test may be operable in their normal mode.	
426 Proper outage planning should identify systems that are important to shutdown	
427 safety. A sufficient number of systems should be available so as to minimize the	
428 risk during the performance of the Type A test.	
429	
430 For planning and scheduling purposes, or ALARA considerations, licensees	
431 may want to consider not venting and draining additional penetrations that are	
432 capable of local leakage rate testing. It should be noted that the Type B or C tests	
433 performed on those pathways must test all of its containment barriers. This	
434 includes bonnets, packings, flanged joints, threaded connections, and compression	
435 fittings. If the Type B or C test pressurizes any of the pathway's containment	
436 barriers in the reverse direction, it must be shown that test results are not affected	
iot in a non-conservative manner sy an ectionary. The no iot is found and the not	eleted: As
	eleted: As
	eleted: 24
440 that the Type A test is performed and must be added to the Type A leakage rate	
441 UCL to determine the overall L_a surveillance acceptance criteria in accordance with	
the definition in ANSI/ANS 56.8–1994.	
443	
444	
445 9.2.2 Initial Test Intervals	
446	
447 A preoperational Type A test shall be conducted prior to initial reactor	
448 operation. If initial reactor operation is delayed longer than 36 months after	
450 shall be performed prior to initial reactor operations.	
451	

The first periodic Type A test shall be performed within 48 months after the successful completion of the last preoperational Type A test. Periodic Type A tests shall be performed at a frequency of at least once per 48 months, until acceptable performance is established in accordance with Section 9.2.3. The interval for

$\begin{array}{c} 456 \\ 457 \end{array}$	testing should begin at initial reactor operation. Each test interval begins upon completion of a Type A test and ends at the start of the next test.	
$\begin{array}{c} 458 \\ 459 \\ 460 \\ 461 \end{array}$	If the test interval ends while primary containment integrity is either not required or it is required solely for shutdown activities, the test interval may be extended indefinitely. However, a successful Type A test shall be completed prior to	
$\begin{array}{c} 462 \\ 463 \end{array}$	entering the operating mode requiring primary containment integrity.	
$\begin{array}{c} 464 \\ 465 \\ 400 \end{array}$	9.2.3 Extended Test Intervals	
$\begin{array}{c} 466 \\ 467 \end{array}$	Type A testing shall be performed during a period of reactor shutdown at a frequency of at least once per <u>15</u> years based on acceptable performance history.	Deleted: 10
$ \begin{array}{c} 468 \\ 469 \\ 470 \end{array} $	Acceptable performance history is defined as <u>successful</u> completion of two consecutive periodic Type A tests where the calculated performance leakage rate was less than 1.0 L_a . A preoperational Type A test may be used as one of the two	
$\begin{array}{c} 471 \\ 472 \end{array}$	Type A tests that must be successfully completed to extend the test interval, provided that an engineering analysis is performed to document why a	
473	preoperational Type A test can be treated as a periodic test. Elapsed time between	
$\begin{array}{c} 474 \\ 475 \end{array}$	the first and last tests in a series of consecutive satisfactory tests used to determine performance shall be at least 24 months.	
476		
477	For purposes of determining an extended test interval, the performance	
$\begin{array}{c} 478 \\ 479 \end{array}$	leakage rate is determined by summing the UCL (determined by containment leakage rate testing methodology described in ANSI/ANS 56.8–1994) with <u>as</u> –left	Deleted: As
480	MNPLR leakage rates for penetrations in service, isolated or not lined up in their	
481	accident position (i.e., drained and vented to containment atmosphere) prior to a	
482	Type A test. In addition, any leakage pathways that were isolated during	
483	performance of the test because of excessive leakage must be factored into the	
484	performance determination. If the <u>pathway</u> leakage can be determined by a local	Delate de A
485	leakage rate test, the <u>as-left MNPLR</u> for that leakage path must also be added to	Deleted: As
$\begin{array}{c}486\\487\end{array}$	the Type A UCL. If the <u>pathway</u> leakage cannot be determined by local leakage rate testing, the performance criteria for the Type A test are not met.	
488		
489	In reviewing past performance history, Type A test results may have been	
490	calculated and reported using computational techniques other than the Mass Point	
491	method from ANSI/ANS_56.8-1994 (e.g., Total Time or Point-to-Point). Reported	Deleted:
492	test results from these previously acceptable Type A tests can be used to establish	
493	the performance history. Additionally, a licensee may recalculate past Type A UCL	Delete de
494	(using the same test intervals as reported) in accordance with ANSI/ANS_56.8–1994	Deleted:
495	Mass Point methodology and its adjoining Termination criteria in order to	
496	determine acceptable performance history. In the event where previous Type A	

497 498	tests were performed at reduced pressure <u>(as described in 10 CFR 50, Appendix J, Option A)</u> , at least one of the two consecutive periodic Type A tests shall be		
499	performed at peak accident pressure (P _a).		Deleted:
500			
501	9.2.3.1 General Requirements for ILRT Interval Extensions		
502	Beyond Ten Years		
503			
504	Type A ILRT intervals of up to fifteen years are allowed by this		
505	guideline. The Risk Impact Assessment of Extended Integrated Leak		
506	Rate Testing Intervals, EPRI report 1009325, Revision 1, October		
507	2005, indicates that, generically, the risk impact associated with ILRT		
508	interval extensions for intervals up to fifteen years is small. However,		
509	plant-specific confirmatory analyses are required. In addition,		
510	although the historical containment leak-tight performance has been		
511	very good, a few instances of degradation have occurred and have been	÷	
512	detected by supplemental means other than Type A ILRTs. These		
513	means include ASME Boiler and Pressure Vessel Code Section XI,		
514	Subsection IWE/IWL examinations and Maintenance Rule inspections	±	
515	The following paragraphs summarize the additional requirements for		
516	extending ILRT intervals beyond ten years.		
517			
518	9.2.3.2 Supplemental Inspection Requirements	4	Formatted: Bullets and Numbering
519			
520	To provide continuing supplemental means of identifying		
521	potential containment degradation, a general visual examination of		
522	accessible interior and exterior surfaces of the containment for		
523	structural deterioration that may affect the containment leak-tight		
524	integrity must be conducted prior to each Type A test and at periodic		
525	intervals between Type A tests as specified by the applicable year and		
526	addenda of the ASME Boiler and Pressure Vessel Code, Section XI,		
527	Subsections IWE and IWL.		
528			Formatted: Bullets and Numbering
529	9.2.3.3 Plant-Specific Confirmatory Analyses	•	Formatted. Bullets and Numbering
530			
531	To provide plant-specific assurance of the acceptability of the		
532 532	risk impact of extending ILRT intervals up to a maximum of fifteen		
533 524	years, a confirmatory risk impact assessment is required. The		
534	assessment should be performed using the approach and methodology		
535	described in Chapters 4 and 5 of EPRI Report 1009325, Revision 1,		

536	"Risk Impact Assessment of Extended Integrated Leak Rate Testing	
537	Intervals". The analysis is to be performed by the licensee and	
538	retained in the plant documentation and records as part of the basis	
539	for extending the ILRT interval.	
540		
541	9.2.4 Containment Repairs and Modifications	
542		
543	Repairs and modifications that affect the containment leakage integrity	
544	require leakage rate testing (Type A testing or local leakage rate testing) prior to	
545	returning the containment to operation. Testing may be deferred to the next	
546	regularly scheduled Type A test for the following repairs or modifications:	
547		
548	o Welds of attachments to the surface of steel pressure-retaining	
549	boundary;	
550	o Repair cavities, the depth that does not penetrate required design steel	
551	wall by more than 10%, or	
552	o Welds attaching to steel pressure-retaining boundary penetrations	
553	where the nominal diameter of the welds or penetrations do not exceed	
554	one inch.	
555

578
579 Performance criteria do not include addition of the positive differences
580 between the <u>as</u> -found MNPLR and the <u>as</u> -left MNPLR for each pathway tested and
adjusted prior to Type A testing (total leakage savings). Total leakage savings are
identified through performance of Type B and Type C testing and do not contribute
583 significantly to performance of a Type A test. As discussed in Section 9.2, 3, leakage
paths detected during a Type A test that are caused by failures of Type B and Type
585 C test components are not required to be included in determination of adequate
586 performance and Type A test intervals. <u>However, if the pathway leakage cannot be</u>
587 determined by local leakage rate testing, the Type A performance criteria are not
588 <u>met.</u> Corrective actions for Type B and Type C failures should be taken in
accordance with Sections 10.2.1.4, 10.2.2.3, or 10.2.3.4 of this guideline.
590
591
592

Deleted: If the As-found Type A results are not acceptable, then a determination should be performed to identify the cause of unacceptable performance and determine appropriate corrective actions. Cause determination and corrective action should reinforce achieving acceptable performance. Once the cause determination and corrective acceptable performance should be reestablished by performing a Type A test within 48 months following the unsuccessful Type A test. Following a successful Type A test, the surveillance frequency may be returned to once per 10 years. ¶ Deleted: As Deleted: As

59310.0DETERMINING PERFORMANCE-BASED TEST FREQUENCIES FOR594TYPE B AND TYPE C TESTS

596 10.1 Introduction

595

597

598This section discusses the method to determine extended test intervals for 599Type B and Type C tests based on performance. It presents a range of acceptable 600 intervals based upon industry data that have been analyzed through a process 601 similar to that used by NRC in NUREG-1493, and have been reviewed for safety 602 significance. Individual licensees may adopt a testing interval and approach as 603 discussed in this guideline provided that certain performance factors and 604 programmatic controls are reviewed and applied as appropriate. Programmatic 605 controls may be necessary to ensure that assumptions utilized in analysis of the 606 industry data are reasonably preserved at individual facilities. 607

608 The range of recommended frequencies for Type B and Type C tests are 609 discussed in Section 11.0. The proposed frequencies are in part based upon 610 industry performance data that was compiled to support the development of Option 611 B to Appendix J, and a review of their safety significance. A licensee should 612 develop bases for new frequencies based upon satisfactory performance of leakage 613 tests that meet the requirements of Appendix J. Additional considerations used to 614 determine appropriate frequencies may include service life, environment, past 615 performance, design, and safety impact. Additional technical information 616 concerning the data may be found in NUREG-1493. 617618 Consistent with standard scheduling practices for Technical Specifications 619 Required Surveillances, intervals for the recommended surveillance frequency for 620 Type B and Type C testing given in this section may be extended by up to 25

- 621 percent of the test interval, not to exceed 15 months.
- 622

624

623 10.2 <u>Type B and Type C Testing Frequencies</u>

The testing interval for each component begins after its Type B or Type C test is completed and ends at the beginning of the next test. If the testing interval ends while primary containment integrity is not required or is required solely for cold shutdown or refueling activities, testing may be deferred; however, the test must be completed prior to the plant entering a mode requiring primary containment integrity.

631

632Leakage rates less than the administrative leakage rate limits are considered633acceptable. Administrative limits for leakage rates shall be established and

Deleted: data which have been analyzed through a process similar to that

634	documented for each Type B and Type C component prior to the performance of
635	local leakage rate testing. The administrative limits assigned to each component
636	should be specified such that they are an indicator of potential valve or penetration
637	degradation. Administrative limits for airlocks may be equivalent to the
638	surveillance acceptance criteria given for airlocks in Technical Specifications.
639	
640	Administrative limits are specific to individual penetrations or valves, and
641	are not the surveillance acceptance criteria for Type B and Type C tests. Due to the
642	performance-based nature of Option B to Appendix J and this guideline, it is
643	recommended that acceptance criteria for the combined leakage rate for all
644	penetrations subject to Type B or Type C testing be defined as follows:
645	
646	• The combined <u>as</u> -left leakage rates determined on a MXPLR basis for all Deleted: As
647	penetrations shall be verified to be less than 0.60L _a prior to entering a
648	mode where containment integrity is required following an outage or
649	shutdown that included Type B and Type C testing only. These combined
650	leakage rate determinations shall be done with the latest leakage rate
651	test data available, and shall be kept as a running summation of the
652	leakage rates.
653 654	• The as-found leakage rates determined on a MNPLR basis for all newly
$\begin{array}{c} 654 \\ 655 \end{array}$	• The <u>as</u> -found leakage rates, determined on a MNPLR basis, for all newly Deleted: As tested penetrations when summed with the <u>as</u> -left MNPLR leakage rates Deleted: As
650	for all other penetrations shall be less than $0.60L_a$ at all times when
657	containment integrity is required.
658	containment integrity is required.
659	The surveillance acceptance criteria for airlocks are as specified in Technical
660	Specifications. In addition, there is other leakage rate testing specified in the
661	Technical Specifications that contain Surveillance Acceptance Criteria and
662	Surveillance Frequencies. This guideline does not address the performance-based
663	frequency determination of those surveillances.
664	10.2.1 Type B Test Intervals
665	
666	10.2.1.1 Initial Test Intervals (Except Containment Airlocks)
667	
668	Type B tests shall be performed prior to initial reactor operation.
669	Subsequent periodic Type B tests shall be performed at a frequency of at least once
670	per 30 months, until acceptable performance is established per Section 10.2.1.2.
071	

67210.2.1.2 **Extended Test Intervals (Except Containment Airlocks)** 673

674The test intervals for Type B penetrations may be increased based upon 675completion of two consecutive periodic as-found Type B tests where results of each 676 test are within a licensee's allowable administrative limits. Elapsed time between 677the first and last tests in a series of consecutive satisfactory tests used to determine 678 performance shall be 24 months or the nominal test interval (e.g., refueling cycle) 679 for the component prior to implementing Option B to Appendix J. An extended test 680 interval for Type B tests may be increased to a specific value in a range of frequencies from greater than once per 30 months up to a maximum of once per 120 681 682months. The specific test interval for Type B penetrations should be determined by 683 a licensee in accordance with Section 11.0.

684

686 687

688

685 10.2.1.3 **Repairs or Adjustments (Except Containment Airlocks)**

In addition to the periodic <u>as</u>-found Type B test, an <u>as</u>-found Type B test shall be performed prior to any maintenance, repair, modification, or adjustment

activity if the activity could affect the penetration's leak tightness. An as-left Type 689 690 B test shall be performed following maintenance, repair, modification or adjustment 691 activity. In addition, if a primary containment penetration is opened following as-692 found testing, a Type B test shall be performed prior to the time primary 693 containment integrity is required. If the as-found and as-left Type B test results 694 are both less than a component's allowable Administrative Limit, a change in test frequency is not required. If as-found or as-left test results are greater than the 695696 allowable administrative limit, provisions of Section 10.2.1.4 apply. 697 698 Frequency for a Type B testing shall be in accordance with Section 10.2.1.1 if the penetration is replaced or engineering judgment determines that modification of 699 700 the penetration has invalidated the performance history. Testing shall continue at 701 this frequency until adequate performance is established in accordance with

702Section 10.2.1.2. 703

705

704 10.2.1.4 **Corrective Action**

706 If Type B test results are not acceptable, then the testing frequency should be 707 set at the initial test interval per Section 10.2.1.1. In addition, a cause 708 determination should be performed and corrective actions identified that focus on 709 those activities that can eliminate the identified cause of failure¹ with appropriate 710 steps to eliminate recurrence. Cause determination and corrective action should 711reinforce achieving acceptable performance. Once the cause determination and 712corrective actions have been completed, acceptable performance may be

¹ A failure in this context is exceeding an administrative limit and not the total failure of the penetration. Administrative limits are established at a value low enough to identify and allow early correction of potential total penetration failures.

835 836

837

838

BASES FOR PERFORMANCE AND RISK-BASED TESTING FREQUENCIES FOR TYPE A, TYPE B, AND TYPE C TESTS

827 **11.1** <u>Introduction</u> 828

This section provides guidance on establishing leakage testing frequencies
and provides information regarding the risk impact of <u>extending leakage rate</u>
testing intervals. Extended test intervals in Sections 9.0 and 10.0 have been
selected based on performance, and have been assessed for risk impact. The various
factors and discussion in this section should be considered when establishing

834 different plant-specific testing frequencies.

Section 9.0 provides guidance on extending Type A ILRT surveillance intervals.

839 Section 10.0 presents a range of acceptable extended test intervals for Type B 840 and Type C tests. Individual licensees may adopt specific testing intervals of up to 841 60 months or three refueling cycles as discussed in Section 10.0 without additional 842 detailed analysis provided the performance factors discussed in Section 11.3.1 are 843 considered. Additional programmatic controls are discussed in Section 11.3.2 and 844 should be considered when the extended test intervals are greater than 60 months 845 or three refueling cycles. 846

847 11.2 Discussion

848
849 <u>Assessments of the risk impact of extending leakage rate testing intervals</u>
850 <u>have been performed at two different times to support similar objectives. The more</u>
851 <u>recent risk impact assessment, completed in 2005, supported optimized ILRT</u>
852 <u>interval extensions of up to fifteen years. The previous assessments completed in</u>
853 <u>1994-1995 supported Type A ILRT extensions of up to ten years, as well as</u>
854 <u>extensions of Type B and Type C testing intervals.</u>

The objective of the work concluded in 2005 and published as EPRI Product 856 857 <u>No. 1009325, Revision 1 "Risk Impact Assessment of Extended Integrated Leak</u> Rate Testing Intervals" was to perform a generic risk impact assessment for 858 optimized ILRT intervals of up to fifteen years, utilizing current industry 859 performance data and risk-informed guidance, primarily NRC Regulatory Guide 860 861 1.174. This risk impact assessment complements the previous EPRI report, TR-862 104285, Risk Impact Assessment of Revised Containment Leak Rate Testing 863 Intervals. The earlier report considered changes to local leak rate testing intervals 864 as well as changes to ILRT testing intervals. The original risk impact assessment 865 considered the change in risk based on population dose, whereas the revision 866 considered dose as well as large early release frequency (LERF) and containment

867 868 869 870	<u>conditional failure probability (CCFP). The following paragraphs discuss the</u> <u>approach taken and results of this assessment.</u>
871	Approach
872 873 874 875 876 877 878 879 880	The first step was to obtain current containment leak rate testing and performance information. This was obtained through an NEI industry-wide survey conducted in 2001. A database was generated using this information supplemented with recent industry failure reports and previous survey information. The data indicate that there were no failures that could result in a risk-significant large early release. This information was used to develop the probability of a pre-existing leak in the containment. This information was further supplemented with an expert elicitation to assist in the determination of the risk-significant large failure magnitude and frequency.
881 882 883 884	Having both the conservative assessment failure probability as well as the expert elicitation, the risk impact was determined for two example plants, a PWR and BWR, with accident classes developed similar to the original EPRI report but with enhancements for assessing changes in LERF.
885	Results
886 887 888 899 890 891 892 893 894	Using the conservative assumptions concerning the leakage and timing associated with a large early release, the reduction in frequency of the type A ILRT test results in a change in LERF that ranges between the "very small" (<1E-07) and "small" (1E-07 to 1E-06) risk increase regions of Regulatory Guide 1.174. In the cases where the risk increase is conservatively calculated to be greater than the "very small" region, the total LERF is significantly lower than the Regulatory Guide 1.174 threshold criteria of total LERF less than 1E-05 per year. The core damage frequency remains unchanged.
895 896 897 898	Other figures-of-merit have similar very small changes, including the population dose rate and the conditional containment failure probability (CCFP) changing very little over the range of ILRT interval extensions from 3 in 10 years to 1 in 15 years.
899 900 901 902	The use of less conservative expert elicited values for the frequency and magnitude of large early release probabilities, results in even smaller calculated increases to LERF as a result of changes in the ILRT interval extension.
$903 \\ 904 \\ 905$	As can be seen from the two examples as well as the approximately 30 plant-specific analyses developed to date to support one-time ILRT interval extensions, these results, and therefore the conclusions derived from them,

906 907 908	are generically applicable. However, as required in Sections 9.2.3.1 and 9.2.3.3 of this guideline, plant-specific confirmatory risk impact assessments are also required.	
$909 \\910 \\911 \\912 \\913 \\914$	Defense-in-depth as well as safety margins are maintained through the continued inspection of containment as required by ASME Section XI, Subsections IWE and IWL, and other required inspections, such as those performed to satisfy the Maintenance Rule. In addition, this guideline requires acceptable historical performance of Type A Integrated Leak Rate Tests before integrated leak rate testing intervals can be extended.	
$915 \\ 916 \\ 917$	This risk impact assessment confirms previous (NUREG-1493) conclusions regarding risk in extending ILRT intervals up to fifteen years, using current regulatory guidance and risk-informed concepts.

948	
949	NUREG–1493 found the effect of Type B and Type C testing on overall
950	accident risk is small and concluded that:
951	
952	• Performance-based alternatives to local leakage rate testing
953	requirements are feasible without significant risk impacts; and
954	requirementes are reactore wrene at significant rich impacts, and
955	• Although extended testing intervals led to minor increases in potential
956	off-site dose consequences, the actual decrease in on-site (worker) doses
957	exceeded (by at least an order of magnitude) the potential off-site dose
958	increases.
959	
960	NEI, in conjunction with EPRI, undertook a similar study in order to
961	supplement NRC's rulemaking basis and provide added assurance the more
962	detailed elements in this guideline have an adequate basis. Results of the
963	EPRI study are documented in EPRI Research Project Report TR-104285,
964	"Risk Impact Assessment of Revised Containment Leak Rate Testing
965	Intervals."
966	
967	EPRI developed an abbreviated methodology that was used to assess
968	plant risk impact associated with containment leakage rate testing
969	alternatives currently being proposed by this guideline. The overall
970	approach involved an examination of the risk spectra from accidents reported
971	in PWR and BWR IPEs. Plant risk was quantified for PWR and BWR
972	representative plants. Quantification of the risk considered the
973	consequences from containment leakage in more detail than reported in
974	IPEs. The impact associated with alternative Type B and Type C test
975	intervals, measured as a change in risk contribution to baseline risk, is
976	presented in Table 1. The risk values compare well with the analysis in
977	NUREG–1493.
978	
979	The risk model was specifically quantified by using a "failure to seal"
980	probability (as opposed to failure to close considered in IPEs). This required
981	failure rates to be developed for this failure mode. Type B and Type C test
982	data obtained by NEI allowed determination of failure rates where failure is
983	defined as the measured leakage exceeding allowable administrative limits
984	for a specific Type B or Type C component. The failure rate values were used
985	in the containment isolation system fault tree, and used to calculate a
986	failure–to–seal probability. Characterization of baseline risk (in terms of
987	accident sequences that are influenced by containment isolation valve or
000	

containment penetration leakage rate) allowed the plant models to calculate

the risk impact associated with changes in test intervals.

991 As indicated above, historical industry failure rate data was used to 992 develop the component failure to seal probabilities used in the analysis. This 993 approach is quite conservative because these guidelines require 994demonstration of performance prior to extending the component leakage rate 995 testing interval. The performance demonstration consists of successful 996 completion of two consecutive leakage rate tests to increase the interval from 997 30 to 60 months or three refueling cycles, and three consecutive leakage rate 998 tests to increase the interval to greater than 60 months or three refueling 999 cycles. This takes advantage of the findings of NUREG-1493, Appendix A, 1000 which suggests that "If the component does not fail within two operating 1001 cycles, further failures appear to be governed by the random failure rate of 1002 the component," and "Any test scheme considered should require a failed 1003 component pass at least two consecutive tests before allowing an extended test interval." In addition, the penetration failure analysis considered 1004 1005 <u>components that</u> exceeded the administrative limits as failures. The 1006 containment leakage rate computation conservatively used maximum 1007pathway leak rates derived from the upper bounds of the NEI data. 1008 Therefore, the analysis is very conservative, and the component performance 1009 trending provides the necessary confidence demonstration that component 1010 leakage is being managed at a low level. 1011

1012For Type C test, a bounding analysis was performed that assumed all1013valves have test intervals that were extended to 48, 60, 72 and 120 months.1014For Type B tests, it was assumed that electrical penetrations were tested at a1015nominal 120 months frequency. In addition, it was assumed that some1016portion of the penetrations was tested periodically during the 120 months.1017Airlock tests were assumed to be conducted every 24 months. Blind flanges1018were assumed to be tested after each opening, or at 48-month intervals.

1019

1029

1020 There are many points of similarity between the NUREG-1493 report 1021and the EPRI study, both in methodology and assumptions, reflecting close 1022agreement on elements important to safety for containment leakage rate 1023 testing. The similarity also extends to the results. The EPRI study confirms 1024the low risk significance associated with Type A testing intervals of 10 years. Similarly, extending the Type B and Type C test intervals to 120 months was 10251026 found acceptable provided the Type B or Type C components have 1027successfully passed two consecutive tests, and provided that certain controls 1028were imposed on the leakage rate testing program.

1030Changing Appendix J test intervals from those presently allowed to1031those in this guideline slightly increases the risk associated with Type A and1032Type B and Type C-specific accident sequences as discussed in Table 1. The1033data suggests that increasing the Type C test interval can slightly increase1034the associated risk, but this ignores the risk reduction benefits associated1035with increased test intervals. In addition, when considering the total

Deleted: components which

- 1036 integrated risk (representing all accident sequences analyzed in the IPE), the
 1037 risk impact associated with increasing test intervals is negligible (less than
 1038 0.1 percent of total risk). This finding is further reinforced by the
 1039 conservative assumptions used in the analysis. The EPRI study reaffirms
- the conclusion in NUREG–1493 that changes to leakage testing frequencies
 are "feasible without significant risk impact."

1048 11.3 Plant-Specific Testing Program Factors

10491050A licensee may adopt specific surveillance frequencies from Section 10.01051provided that plant-specific test performance history is acceptable as discussed in1052Section 10.0, and certain performance factors and controls are reviewed and applied1053as appropriate in the determination of test intervals. Each licensee should1054demonstrate by quantitative or qualitative review that plant-specific performance1055is adequate to support the extended test interval.

1057 An extension of up to 25 percent of the test interval (not to exceed 15 months) may1058 be allowed on a limited basis for scheduling purposes only.

 $\begin{array}{c} 1059 \\ 1060 \end{array}$

11.3.1

1056

Performance Factors

10611062Prior to determining and implementing extended test intervals for Type B1063and Type C components, an assessment of the plant's containment penetration and1064valve performance should be performed and documented. The following are some1065factors that have been identified as important and should be considered in1066establishing testing intervals:

1067

1084

- Past Component Performance Based on a survey sample of industry data 1068 • from approximately 1987 to 1993, 97.5% of the industry's containment 1069 penetrations have not failed a Type B test, and 90% of the isolation valves 1070 1071have never failed a Type C test in over 500 reactor-years of commercial 1072 operation. Of the 10% of the Type C tests that have failed, only 22% of those 1073have failed more than once. A licensee should ensure that leakage rate 1074testing intervals are not extended until plant-specific component 1075 performance of two successful consecutive <u>as</u>-found tests are performed.
- 1076 *Service* The environment and use of components are important in determining its likelihood of failure. For example, a plant may have experienced high leakage in valves in a high-flow steam environment due to effects of valve seat erosion. Certain valves that open and close frequently during normal plant operations may have experienced higher leakage. The licensee's existing testing program should identify these types of components to establish their testing intervals based on their performance history.
- <u>Design</u> Valve type and penetration design may contribute to leakage. For example, motor operated valves in a plant may be found to leak less frequently than check valves, and may support a longer test interval. Vendor recommendations for valve or penetration subcomponent service life may be a factor in determining test intervals. Certain passive penetrations, such as electrical penetrations, may have had excellent performance history. Test intervals for these penetrations may be relatively longer.

31

Deleted: As

1092		
1093	•	<u>Safety Impact</u> — The relative importance of penetrations can be judged in
1094		terms of the potential impact of failure in limiting releases from containment
1095		under accident conditions. Due to size or system inter–connections, some
1096		components or penetrations may be more important than others in ensuring
1097		the safety function of a containment penetration is achieved. This relative
1098		importance should be considered in determining the test interval.
1099		
1100	•	<u>Cause Determination</u> — For failures identified during an extended test
1101		interval, a cause determination should be conducted and appropriate
1102		corrective actions identified. Part of a corrective action process should be to
1103		identify and address common-mode failure mechanisms.
1104		
1105	11.3.2	Programmatic Controls
1106		5
1107		If a licensee considers extended test intervals of greater than 60 months or
1108	three	refueling cycles for a Type B or Type C tested component, the review to
1109		ish surveillance test intervals should include the additional considerations:
1110		
1111	•	<u>As-found Tests</u> — In order to provide additional assurance that the increased
1112		probability of component leakage is kept to a minimum, and is reasonably
1113		within the envelope of industry data, a licensee should consider requiring
1114		three successive periodic <u>as</u> -found tests to determine adequate performance.
1115		
1116	•	<u>Schedule</u> — To minimize any adverse effects of unanticipated random
1117		failures, and to increase the likelihood unexpected common-mode failure
1118		mechanisms will be identified in a timely manner, a licensee should
1119		implement a testing program that ensures components are tested at
1120		approximate evenly– distributed intervals across the extended testing
1121		interval for valves or groups of valves. A licensee should schedule a portion
1122		of the tests during each regularly scheduled outage or on some regular
1123		periodic basis, such that some percentage of the components are tested
1124		periodically, and all components are tested at the new extended test interval
1125		of greater than 60 months or three refueling cycles.
1126		
1127	•	<u><i>Review</i></u> — A review of the entire process should be performed prior to
1128		establishing alternate test intervals under Option B to 10 CFR 50, including
1129		plant-specific performance history, data analysis, establishment of
1130		surveillance frequencies, and, if available and applicable, any risk–impact
1131		assessment. This review should include adjustments to the program as
1132		required, based on expert insight or engineering judgment. Results of the
1133		review should be documented.

1135 12.0 RECORDKEEPING

1137 12.1 Report Requirements

113811391140cycle's Type B and Type C tests, and Type A, Type B, and Type C tests, if performed

1141 during that outage. The technical contents of the report are generally described in

1142 ANSI/ANS 56.8–1994, and will be available on–site for NRC review. The report

shall also show that the applicable performance criteria are met, and serve as a
record that continuing performance is acceptable.

1144 re 1145

1146 **12.2** <u>Records</u>

1147

1136

1148 Documentation developed for implementation <u>of Option</u> B to Appendix J

1149 should be done in accordance with licensee established procedures. Sufficient

- 1150 documentation shall be collected and retained so that the effectiveness of the
- 1151 implementation of Option B to Appendix J can be reviewed and determined. This
- 1152 documentation, including the plant-specific confirmatory risk impact assessment for
- 1153 extending ILRT intervals beyond ten years shall be available for internal and
- 1154 external review, but is not required to be submitted to the NRC.
