MEMORANDUM

From: Thomas J. O'Dou, Project Manager

To: Mr. Ron Levy, Fort McClellan, AL

Subject: Fort McClellan - Hot Cell Characterization - Report

This report provides details of the radiological characterization of Building 3192 and surrounding grounds at the Fort McClellan facility.

We completed the characterization, including collection of samples from all outside areas on November 8, 1994. The hot cell was found to have some areas which will likely need scabbling to remove contaminated concrete as will the hot cell trough.

Areas outside the building showed some levels of activity above background by direct survey. Soil samples taken in all areas have been sent to TMA Eberline for analysis and results are expected within a few weeks. A final report of characterization will be prepared upon receipt of those results.
