NRC FORM 651 (10-2004) 10 CFR 72

CERTIFICATE OF COMPLIANCE FOR SPENT FUEL STORAGE CASKS

Page 1 of 4

The U.S. Nuclear Regulatory Commission is issuing this Certificate of Compliance pursuant to Title 10 of the Code of Federal Regulations, Part 72, "Licensing Requirements for Independent Storage of Spent Nuclear Fuel and High-Level Radioactive Waste" (10 CFR Part 72). This certificate is issued in accordance with 10 CFR 72.238, certifying that the storage design and contents described below meet the applicable safety standards set forth in 10 CFR Part 72, Subpart L, and on the basis of the Final Safety Analysis Report (FSAR) of the cask design. This certificate is conditional upon fulfilling the requirements of 10 CFR Part 72, as applicable, and the conditions specified below.

Safety Analysis Report Title

Transnuclear Inc., "Safety Analysis Report for the NUHOMS[®] HD Horizontal Modular Storage System for Irradiated Nuclear Fuel"

CONDITIONS

This certificate is conditioned upon fulfilling the requirements of 10 CFR Part 72, as applicable, the attached Appendix A (Technical Specifications) and the conditions specified below:

1. CASK:

a. Model No. NUHOMS® HD-32PTH

The two digits refer to the number of fuel assemblies stored in the dry shielded canister (DSC), the character P for pressurized water reactor (PWR) is to designate the type of fuel stored, T to designate that the DSC is intended for transportation in a 10 CFR Part 71 approved package, and the last character H to designate that the design is qualified for fuel with burnup greater than 45 GWd/Mtu.

b. Description

The NUHOMS[®] HD System is certified as described in the safety analysis report (SAR) and in the Nuclear Regulatory Commission's (NRC's) Safety Evaluation Report (SER). The NUHOMS[®] HD System is a horizontal canister system composed of a steel Dry Shielded Canister (DSC), a reinforced concrete Horizontal Storage Module (HSM-H), and a Transfer Cask (TC). The NUHOMS[®] HD has been designed for enhanced heat rejection capabilities, and to permit storage of non fuel assembly hardware with the fuel and/or damaged spent fuel assemblies. The welded DSC provides confinement and criticality control for the storage and transfer of irradiated fuel. The concrete module provides radiation shielding while allowing cooling of the DSC and fuel by natural convection during storage. The TC is used for transferring the DSC from/to the spent fuel pool building to/from the HSM-H.

b. Description (continued)

The principal component subassemblies of the DSC are the shell with integral bottom cover plate and shield plug and ram/grapple ring, inner top cover/shield plug, top cover plate, and basket assembly. The 32PTH DSC basket consists of stainless steel square tubes and support strips for structural support, and geometry control; and aluminum/borated aluminum/Boral[®] or Metal Matrix Composite for heat transfer and criticality control. This assembly is designed to hold 32 PWR fuel assemblies. The DSC is designed to slide from the transfer cask into the HSM-H and back without damage to the sliding surfaces.

The HSM-H is a reinforced concrete unit with penetrations located at the top and bottom for air flow. The penetrations are protected from debris intrusions by wire mesh screens during storage operation. The HSM-H has heat shields that provide thermal protection for the HSM-H concrete. The DSC Support Structure, a structural steel frame with rails, is installed within the HSM-H module to provide for sliding the DSC in and out of the HSM-H and to support the DSC within the HSM-H. HSM-Hs are arranged in arrays to minimize space and maximize self-shielding.

The TC is designed and fabricated as a lifting device to meet ANSI N14.6 criteria. It is used for transfer operations within the spent fuel pool building and for transfer operations to/from the HSM-H. The TC is a cylindrical vessel with a bottom end closure assembly and a bolted top cover plate. Two upper lifting trunnions are located near the top of the cask for downending/uprighting and lifting of the cask in the spent fuel pool building. The lower trunnions, located near the base of the cask, serve as the axis of rotation during downending/uprighting operations and as supports during transport to/from the Independent Spent Fuel Storage Installation (ISFSI).

With the exception of the TC, fuel transfer and auxiliary equipment necessary for ISFSI operations are not included as part of the NUHOMS[®] HD System referenced in this Certificate of Compliance (CoC).

c. Drawings

The drawings for the NUHOMS® HD System are contained in Section 1 of the SAR.

d. Basic Components

The basic components of the NUHOMS[®] HD System that are important to safety are the DSC, HSM-H, and TC. These components are described in Section 2.5 and Table 2-5 of the SAR.

2. OPERATING PROCEDURES

Written operating procedures shall be prepared for cask handling, loading, movement, surveillance, and maintenance. The user's site-specific written operating procedures shall be consistent with the technical basis described in Chapter 8 of the SAR.
