1 🔽 RO 🗹 SRO Question ID: 28345 Origin: Bank 🗋 Memory Level

From 100% power and 100% flow, the "B" reactor recirculation pump (RRP) inadvertently trips.

How will indicated jet pump flow respond to this event?

Flow indications for the "A" loop jet pumps will ...

A ... initially increase, then return to their original values. Flow indication for the "B" jet pumps will decrease to zero as the pump coasts down, then increase to a positive value as flow reverses in the "B" loop jet pumps.

B ... decrease, then increase to their original values as flow through the "B" loop jet pumps slows, then reverses. Flow indication for the "B" jet pumps will immediately read zero.

C . . . increase during the transient. Flow indication for the "B" loop jet pumps will decrease to zero as the "B" RRP coasts down, then remain at zero.

D . . . increase during the transient. Flow indications for the "B" loop jet pumps will decrease to zero as the "B" RRP coasts down, then increase to a positive value as flow reverses in the "B" loop jet pumps.

Answers: A B C D A References Provided to Applicant:							
Justification							
CHOICE (A) - No WRONG: Wrong Level, ST & FW changes VALID DISTRACTOR: correct power changes.							
CHOICE (B) - No WRONG: Wrong RPV Water Level Effect. VALID DISTRACTOR: Correct Power, ST and FW changes							
CHOICE (C) - No WRONG: Reverses the actual FW and ST changes - both affect Level Error. VALID DISTRACTOR: Correct Power and Level change							
CHOICE (D) - YES Steam Flow RISES cause HPCI Turbine Operating. Therefore, RPV pressure drops cause ST rises and Power rises due to colder FW. RPV Water Level will rise because FW now > ST. Stable when Level Error offsets Flow Error Total Steam Flow will rise because now have additional steam flow path Indicated FW Flow lowers to create the Flow Error that offsets Level Error.

31 🛛 RO 🗹 SRO Question ID: 29601 Origin: New 🗹 Memory Level

With the plant at full power, quarterly surveillance testing of the High Pressure Coolant Injection (HPCI) system per SO-152-002 causes the HPCI system to be __(1)__. The liquid flow path is __(2)__.

A (1) NOT OPERABLE because injection valve HV155F006 is deenergized in the closed position.

(2) from the Suppression Pool to the Pumps and return to the Suppression Pool.

B (1) NOT OPERABLE because injection valve HV155F006 is deenergized in the closed position.

(2) from the Condensate Storage Tank to the Pumps and return to the Condensate Storage Tank.

C (1) OPERABLE because HPCI will automatically realign to the injection mode upon receipt of an initiation signal.

(2) from the Suppression Pool to the Pumps and return to the Suppression Pool.

D (1) OPERABLE because HPCI will automatically realign to the injection mode upon receipt of an initiation signal.

(2) from the Condensate Storage Tank to the Pumps and return to the Condensate Storage Tank.

32 RO SRO Question ID: 29602 Origin: Mod 🗌 Memory Level

Both SSES units were at full power and SSES Unit 1 was running Core Spray pumps 1P206A and 1P206C for surveillance testing when the site experienced a Loss of Offsite Power (LOOP).

- Both units are now maintaining Reactor Pressure Vessel (RPV) pressure and inventory with the Reactor Core Isolation Cooling (RCIC) system.

- All engineered safeguards (ES) buses are powered from their associated emergency diesel generators (EDG).

Subsequently, a transient affects SSES Unit 2 and results in the following conditions:

- SSES Unit 2 RPV Water Level is -60 inches.

- SSES Unit 2 RPV Pressure is 350 psig.

- SSES Unit 2 Drywell Pressure is 1.8 psig.

Which ONE of the following describes the AUTOMATIC actions of the SSES Unit 2 Core Spray Pumps?

▲ Core Spray pumps 2P206A, 2P206B, 2P206C and 2P206D start after a 15 second time delay.

- B Core Spray pumps 2P206A, 2P206B, 2P206C and 2P206D start after a 10.5 second time delay.
- C Core Spray pumps 2P206B and 2P206D start after a 10.5 second time delay. Core Spray pumps 2P206A and 2P206C do NOT start.
- **D** Core Spray pumps 2P206B and 2P206D start after a 15 second time delay. Core Spray pumps 2P206A and 2P206C do NOT start.

33 RO SRO Question ID: 29691 Origin: New Demory Level

Both SSES units are at full power. During shift turnover, you notice that the:

- white indicating light for Standby Liquid Control (SBLC) squib valve 148F004A is EXTINGUISHED - white indicating light for Standby Liquid Control (SBLC) squib valve 148F004B is ILLUMINATED

Before accepting the shift, you go to the Relay Room and determine that the Unit 1 SBLC squib valve CONTINUITY METERS read:

- 0.1 milliamps (ma) for squib valve 148F004A.

- 4.7 milliamps (ma) for squib valve 148F004B.

Which ONE of the following correctly describes the status of the SBLC squib valves?

A 148F004A is Operable 148F004B is Operable

- **B** 148F004A is NOT Operable 148F004B is Operable
- C 148F004A is Operable 148F004B is NOT Operable
- D 148F004A is NOT Operable 148F004B is NOT Operable

Question Number:	33

34 RO SRO Question ID: 29692 Origin: Mod Demory Level

SSES Unit 1 is operating at full power. The following Standby Liquid Control System (SBLC) conditions exist following SBLC tank filling:

- SLC tank temperature is 70 F
- AR 107 B03, STANDBY LIQUID TANK HI/LO TEMP is in alarm
- SLC tank level is 5100 gallons
- AR 107 C03, STANDBY LIQUID TANK HI/LO LEVEL is in alarm

- Chemistry sample results after filling indicate that the concentration of the sodium pentaborate solution in the SLC tank is 15.4% by weight

Which ONE of the following actions, if any, are required to meet Technical Specifications?

- A No action required. The LCO is satisfied.
- **B** Raise SBLC Tank Temperature.
- C Lower SBLC Tank Volume/Level.
- **D** Raise Sodium pentaborate concentration.

	; otherwise (C and D are	e not plaus	sible. I car	tor in the plant (not necessarily IRMs) that will fail upscale n't think of any at the plants I worked. or Div I IRMs.
		DOMINICO			F. H. S. NOT I. S. Mitchese, Description of the OOFO is

Changed Distracter "D" to fail DOWNSCALE and IRMs B, D, F, H can NOT be withdrawn. Request sent to SSES to determine if any meters fail high. If so, may return to UPSCALE.

09/28/05 Phone conversation with SSES: they agree it is implausible for an IRM to fail UPSCALE and indicated that this could happen on plants with DC powered IRMs. They did not consider an UPSCALE failure credible. Therefore, changes indicated above should alleviate this concern because now only one distracter contains the UPSCALE failure. Adjusted the ability to withdraw IRMs to make distracter "C" more enticing.

Todd 09/30/05 - changed "fail" to "failed" in all four choices.

SQ 10/18/05 - deleted conditions leading to loss of 1D672 because LOD = 5 and because unrealistic scenario. Simply stated that the Load Center is lost due to heavy grounds. During phone conversation on 10/17/05, SSES indicated that this system is the only ungrounded DC system at the plant. Therefore, grounds would be a realistic concern. SSES initially indicated that asking whether the detectors could be inserted/withdrawn was trivial (LOD=5) - later reconsidered this and indicated it was fair to ask.

The following SSES Learning Objectives support this question:

2347 Describe the relationships between the Intermediate Range Monitor System and the following: a. 24 VDC Distribution System

10230 State the power supply to the Intermediate Range Monitor System channels and detectors.

- 2337 Predict the effect that the following conditions will have on the Intermediate Range Monitor System: a. Loss of 24 VDC
 - b. Detector drive failure

SSES Unit 2 is in Mode 2, conducting a normal reactor startup per GO-200-102, PLANT STARTUP, HEATUP AND POWER OPERATION. The following conditions exist:

- the reactor is CRITICAL.
- RPV Pressure is 0 psig.
- All Intermediate Range Monitors (IRM) are on Range 3
- Source Range Monitor (SRM) detectors are being withdrawn intermittently, TWO AT A TIME.
- SRM level is being maintained between 5E3 (5,000) and 5E4 (50,000) counts per second (CPS).
- SRM Channel "A" reads 6.1E3 (6,100) CPS and slowly rising.
- SRM Channel "B" reads 7.2E4 (72,000) CPS and slowly rising.
- SRM Channel "C" reads 6.0E3 (6,000) CPS and slowly rising.
- SRM Channel "D" reads 6.1E3 (6,100) CPS and slowly rising.

Which ONE of the following correctly describes (1) the cause of these indications and (2) actions required to continue the startup?

(1) SRM Detector "B" is stuck & located

- (2) The reactor startup may . . .
- A (1) ... LOWER in the core than SRM Detectors "A", "C", & "D".
 (2) ... continue. The SRM Upscale Block is AUTOMATICALLY bypassed when all IRMs are on Range 3 or above.
- B (1)...LOWER in the core than SRM Detectors "A", "C", & "D".
 (2)... continue if Operators MANUALLY bypass SRM "B" to prevent a Rod Withdrawal BLOCK at 2E5 (20,000) CPS.
- (1) ... HIGHER in the core than SRM Detectors "A", "C", & "D".
 (2) ... continue if Operators MANUALLY bypass SRM "B" to prevent a Rod Withdrawal BLOCK at 2E5 (20,000) CPS.
- D (1) ... HIGHER in the core than SRM Detectors "A", "C", & "D".
 (2) ... continue. The SRM Upscale Block is AUTOMATICALLY bypassed when all IRMs are on Range 3 or above.

39 RO SRO Question ID: 29699 Origin: Bank 🗌 Memory Level

SSES Unit 2 is at 12% reactor power with the Reactor Mode Switch in STARTUP/HOT STANDBY. The present status of LPRM inputs and APRM power levels is:

	APRM A	APRM B	APRM C	APRM D	APRM E	APRM F
D Level inputs	4	3	2	4	3	4
C Level inputs	3	2	4	4	3	3
B Level inputs	4	3	3	4	4	2
A Level inputs	3	2	4	3	4	5
Power indicated	12%	11 %	14%	11 %	14%	10%

Which ONE of the following correctly describes the plant response to these conditions?

A No AUTOMATIC action. The "B" APRM is administratively INOPERABLE.

B A control rod block and ONLY a half reactor scram in channel "B" will occur.

C A control rod block and ONLY a half reactor scram in channel "A" will occur.

D A control rod block and a full reactor scram will occur.

41 RO SRO Question ID: 29611 Origin: New Demory Level

With SSES Unit 2 at full power, a Safety Relieve Valve (SRV) inadvertently opened and is now indicating CLOSED. What is the expected tailpipe temperature 45 minutes later if the SRV is leaking?

Assume Suppression Pool Pressure is 0.2 psig.

Select the closest answer.

- ▲ 551 degrees Fahrenheit.
- **B** 545 degrees Fahrenheit.
- C 296 degrees Fahrenheit.
- D 252 degrees Fahrenheit.

Answers: A B C V D References Provided to Applicant: V
Justification
CHOICE (A) - No WRONG: this is Tsat for normal RPV pressure of 1040 psig. VALID DISTRACTOR: TMI lesson learned.
CHOICE (B) - No WRONG: this is Tsat for normal MS Header pressure of 985 psig. VALID DISTRACTOR: TMI lesson learned.
CHOICE (C): YES At 1040 psig (1055 psia), the steam vapor enthalpy is 1190.8 BTU/lbm. Throttling is an isenthalpic process. From the Mollier diagram, we see that the expected tailpipe temperature is in the vicinity of 280 deg F. From the tables, we can interpolate to 296 deg F.
CHOICE (D) - No WRONG: this is 2 deg F above the alarm set point. VALID DISTRACTOR: the alarm set point is 250 deg F
References Standard Steam Tables
Comments and Question Modification History
🗹 GX.J 🗹 THF 🗹 RJC 🗹 SSES
Gil 09/26/05 - K/A mismatch. R: will reconsider. Agree that this does not DIRECTLY test automatic ADS valve operation. But Applicant should understand whether tailpipe temperatures are trending to ambient or not following an open SRV.
Todd 09/30/05 - verify with SSES that 45 minutes eliminates "D" as potentially correct.
SQ 10/14/05 - changed 14.7 psig to 0.2 psig.

43 RO SRO Question ID: 29700 Origin: New Demory Level

During a plant transient the Control Room is EVACUATED. You report to the SSES Unit 2 Remote Shutdown Panel (1C201). The following conditions now exist:

- Main Steam Isolation Valves (MSIV) are CLOSED.
- Drywell Pressure is 1.9 psig.
- Safety Relief Valve (SRV) control has been transferred to the Remote Shutdown Panel.

Which ONE of the following correctly describes status of the Safety Relief Valves (SRV)?

- A SRVs "A", "B", and "C" can ONLY operate MANUALLY in the Overpressure RELIEF Mode. AUTOMATIC Overpressure SAFETY operation is still functional for all SRVs.
- **B** SRVs "A", "B", and "C" can operate AUTOMATICALLY or MANUALLY in the Overpressure RELIEF Mode.

AUTOMATIC Overpressure SAFETY operation is still functional for all SRVs.

- **C** SRVs "A", "B", and "C" can ONLY operate MANUALLY in the Overpressure RELIEF Mode. AUTOMATIC Overpressure SAFETY operation is functional ONLY for SRVs "D" through "S".
- D SRVs "A", "B", and "C" can operate AUTOMATICALLY or MANUALLY in the Overpressure RELIEF Mode. AUTOMATIC Overpressure SAFETY operation is functional ONLY for SRVs "D" through "S".

Answers: A B C D	References Provided to Applicant:
Justification	
Complete rewrite of original question. Old question saved as Order 431.	
CHOICE (A) - YES	
CHOICE (B) - No WRONG: "A", "B", "C" can NOT be AUTO once transferred to the RSD. VALID DISTRACTOR: Safety mode is correct	
CHOICE (C) - No WRONG: Safety Mode of "A", "B", "C" is still available VALID DISTRACTOR: Correct RSD effect.	
CHOICE (D) - No WRONG: mirror imaging. VALID DISTRACTOR: mirror imaging.

Comments and Question Modification History	
☑ GXJ ☑ THF ☑ RJC □ SSES	

NOTE: per ON-100-009, ADS valves can be operated from the Relay Rooms.

Revised correct answer to "A" after telephone discussion with SSES. Accumulators will provide some operation of SRVs A, B, C from the RSD in this condition. Operation in SAFETY mode will not deplete the accumulator.

????? QUESTION: would the accumulators have depleted in RELIEF mode by now? ????????

1. Gil 09/26/05 - believes SRVs always operate in Overpresssure Relief mode before safety relief mode. This will deplete the air supply. Question may have NO correct answer if this is true.

R: The stem conditions state that pressure is cycling between 1180 and 1150. At these higher values, the SRVs have to be in the Safety mode because RPV pressures would be lower in the Relief mode. Applicant should be sufficiently familiar with the set points to recognize this.

May need to delete second half of question regarding which SRVs have controls at the RSD to make the entire question plausible. Distracters c/b RELIEF, ADS, RCIC/HPCI.

Agree to toss second half out and make corrections to remaining distracters. Essentially rewrote the question. Saved old one as 431.

NOTE: from ON-100-009, learned that Automatic RELIEF mode operation is NOT possible when control transferred to RSD panel. May be able to use this if further revision required.

Todd 09/30/05 - grammatical correction to accommodate distracter "D".

SQ 10/18/05 - original rejected as too confusing and relies on RSD panel during accident - not design based. Saved original as 431.

46 RO 🗹 SRO Question ID: 29616 Origin: New 🗋 Memory Level

The following conditions exist on SSES Unit1:

- Recently entered Mode 4 in preparation for a planned refueling outage.

- Primary Containment is PURGING.

SSES Unit 2 has a Loss of Coolant Accident (LOCA) and DRYWELL PRESSURE quickly rises above 1.72 psig.

Which ONE of the following describes the correct ventilation system response?

A All three Reactor Building Zones (1, 2 and 3) Isolate and automatically reconfigure to RECIRCULATION.

Standby Gas Treatment (SGTS) automatically takes suction on the Reactor Building Exhaust ventilation stack.

SSES Unit 1 PURGE automatically ISOLATES.

-

B Reactor Building Zones 2 and 3 Isolate and automatically reconfigure to RECIRCULATION.

Standby Gas Treatment (SGTS) automatically takes suction on the Reactor Building Exhaust ventilation stack.

SSES Unit 1 PURGE automatically ISOLATES.

C Reactor Building Zones 2 and 3 Isolate and automatically reconfigure to RECIRCULATION.

Standby Gas Treatment (SGTS) automatically takes suction on the Reactor Building Recirculation plenum.

SSES Unit 1 PURGE Continues.

D All three Reactor Building Zones (1, 2 and 3) Isolate and automatically reconfigure to RECIRCULATION.

Standby Gas Treatment (SGTS) automatically takes suction on the Reactor Building Recirculation plenum.

SSES Unit 1 PURGE Continues.

Justification				_
CHOICE (A) - N WRONG: Only VALID DISTRAC	Zones 2 and 3 Isola	te. SGTS does n	ot take suction	on the Exhaust Vent
	S does NOT take su			would draw suction on the normal exhaust path.
SGTS automatic	ES and 3 (Common) Is cally takes suction o does not isolate. Th	n RB Recirc plen	um	
	o Zones 2 and 3 isola CTOR: Purge contin		uction is correc	t.

48 RO SRO Question ID: 29657 Origin: New Demory Level

SSES has a Loss of Offsite Power (LOOP). Emergency Diesel Generator (EDG) "A" fails to start. Operators start EDG "E" and energize 1A201 and 2A201 one hour later.

Both VITAL AC UPS (1D666 & 2D666) are energized from their __(1)__ source.

All four NON-CLASS 1E INSTRUMENT AC UPS (1D240, 1D130, 2D240, 2D130) are energized from their __(2)__ source.

Note: UPS = UNINTERRUPTIBLE POWER SUPPLIES

- A 250-VDC ALTERNATE source (1D662, 2D142). 250-VDC ALTERNATE source (1D652, 1D662, 2D652, 2D662)
- **B** 480-VAC ALTERNATE source (1B246, 2B246). 250-VDC BATTERY source (1D243, 1D133, 2D243, 2D133)
- C 480-VAC PREFERRED source (1B246, 2B246). 480-VAC PREFERRED source (1B216, 1B226, 2B216, 2B226)
- D 250-VDC PREFERRED source (1D662, 2D142). 480-VAC ALTERNATE source (1B216, 1B226, 2B216, 2B226)

Answers: A B C D V References Provided to Applicant:					
Justification					
CHOICE (A) - No WRONG: Vital: Pfd v. Alt. Inst: wrong source of 250-VDC & would not be on 250-VDC					
CHOICE (B) - No WRONG: Would not transfer to ALTERNATE These batteries deplete after 20 minutes.					
CHOICE (C) - No WRONG: Vital: 480-VAC is not Pfd. This is NOT Pfd source.					
CHOICE (D) - YES					
WRONG: Vital: no reason to shift to 480-VAC alt Inst: would have shifted back to Pfd 480-VAC source					
HOD because Applicant must distinguish LOOP from Blackout. Here, following a LOOP, the EDGs respond to power the ES busses.					
References					
TM-OP-017 See also, 480 VAC, 250 VDC.					
Comments and Question Modification History					
EXJ THF RJC SSES					
Gil 09/26/05 - "A" and "C" not plausible with "allcomponents operate as designed". That is, everyone should know 1E equipment will be energized. Use a different term (RPS MG Set or Instrument AC Distribution Panel 1Y216, etc) rather than "CLASS 1E".					
Answer B does not appear correct. The way I read the references the preferred will be lost for about 10 seconds and the UPS will run on DC. Then when the EDG energizes the bus the UPS will automatically shift back to preferred.					
R: will revisit this question.					
Added "one minute after" to expressly show question is asking for conditions after the transient.					
Suggestion: don't say "Class 1E" and just identify the buss itself.					
•					
COMPLETE REWRITE 27 SEPTEMBER 2005					
•					
Todd 09/30/05 - same question with substantial revisions. Saved old one as 481.					
SSES 10/16/05 - EDG "E" can NOT be started in under 45 minutes. Therefore, changed from 20 minutes to one hour and revised answer and distractors accordingly.

250 VDC Battery Charger 2D663 has the following front panel indications:

- Battery Charger Float-Equalize switch is in FLOAT.
- Battery Charger Interval Timer set to FIVE HOURS.

Which ONE of the following is correct concerning charger operation?

A Output voltage will be between 279 and 287 VDC for five hours, then LOWER to between 265 and 271 VDC thereafter.

- **B** Output voltage will be between 265 and 271 VDC for five hours, then RISE to between 279 and 287 VDC thereafter.
- C Output voltage will be between 279 and 287 VDC for five hours and will remain between 279 and 287 VDC thereafter.
- **D** Output voltage will be between 265 and 271 VDC for five hours and will remain between 265 and 287 VDC thereafter.

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (A) - YES Per TM-OP-088 and OP-1(2)88-001, this provides Equalizing Charge for five hours, then automatically reconfigures to the FLOAT mode.
CHOICE (B) - No WRONG: Reverse of correct answer VALID DISTRACTOR: First FLOAT, then EQUALIZE
CHOICE (C) - No WRONG: Stay on EQUALIZE VALID DISTRACTOR: Correct if Float-Equalize switch in EQUALIZE
CHOICE (D) - No WRONG: Stay on Float VALID DISTRACTOR: Applicant my believe that the Float-Equalize switch must be in EQUALIZE to conduct charge.

Revised stem IRT phone close to call.	conversation	with SSES stat	ff. Still need t	o consider distracter "A" as potentially correct or too
1. Gil 09/26/05 - Is 2C66 R: yes. I verified that du			vith SSES bu	t will reconfirm during validation.
 2. Gil 09/26/05 - Add to stem: "full power with normal loads on the instrument air system" Why is Instrument Air Pressure steady? Should be cycling between 93 and 99 psig (or between 93 and 102 psig if lightly loaded). Similar comment for Instrument Air Header Pressure. R: question originally drafted as Gil suggests. Per phone conversation with SSES Staff, learned that pressure cycling is not apparent on the 2C668 panel. 				
Will revisit with SSES - t	ry to run on sir	nulator.		
Todd 10/05/05 - Backwards logic but acceptable because it is HCL				
Rich 10/09/05 - why two R: question 9 asks for p		at the HCL. T	his asks for I/	A response to tripped lead compressor.

53 RO SRO Question ID: 29622 Origin: New 🗹 Memory Level

Both units are at full power when the following conditions develop on SSES Unit 1:

- RBCCW HEAD TANK HI-LO LEVEL (AR-123-001, E06) annunciates.
- Auxiliary Operators check RBCCW DEMIN WTR SUPPLY ISO 113024 Closed.
- Auxiliary Operators drain the RBCCW Head tank to 5/8 full.

After several hours:

- RBCCW HEAD TANK HI-LO LEVEL (AR-123-001, E06) annunciates.
- All other conditions in the plant are NORMAL.

- The STA reports that RBCCW Head Tank level has been slowly rising since it was drained several hours ago and that all other RBCCW indications are normal.

Per established SSES procedures, the Operating Crew must:

Swap CRD Pumps and Isolate the previously running CRD Pump.

- B Remove the RWCU system from service and Isolate RBCCW to the NRHX.
- **C** Swap RBCCW Heat Exchangers (1E201A/B) and Isolate the previously in-service Heat Exchanger.
- D Check RBCCW DEMIN WTR SUPPLY ISO 113024 Closed and drain the RBCCW Head tank to 5/8 full.

Answers: A	В	с 🔽 🛛		References Provided to Applicant:
Justification				
CHOICE (A) - No WRONG: This is a VALID DISTRACTO		high TBCCW S	- Gurge Tank.	
CHOICE (B) - No WRONG: This woul VALID DISTRACTO				the high level. However, no radiation present.
CHOICE (C) - YES				
CHOICE (D) - No WRONG: already d VALID DISTRACTO		1, E06 - time to	o suspect the RBC	CW HX and isolate it.

⊠ £X J	✓ THE	🗹 RJC		
Gil 09/26/05 - OK				
Rich 10/09/05 - If no	t immediate action	n, should we sr	becify procedure?	

R: the action required by answer "C" is part of the alarm response and not part of the ON. Given these indications and choices, the successful Applicant should be able to recognize "C" as the only answer that would address these conditions. "A" is obviously wrong because it is NOT a RBCCW load. "B" is wrong because all conditions are otherwise normal which implies no radiation or high temperatures to indicate NRHX leak. "D" has already been done and will not alleviate the continuing rise in level. I did add another bullet to drive the Applicant further away from "D".

Todd 10/17/05 - 2-part K/A at the RO level.

The following SSES Learning Objectives support this question:

10258 Given appropriate alarm response procedures, determine the following for any annunciator associated with the Reactor Building Closed Cooling Water System:

- 1. Probable cause of the alarm
- 2. Adverse consequences of continued operation in the alarm state
- 3. Appropriate course of action

Applicant should be able to reason the correct course of action without the Alarm Response Procedure.

1676 Predict the effect that the following conditions will have on the Reactor Building Closed Cooling Water System: h. High or low RBCCW Head Tank level

Unable to adequately test both ability to predict and use procedures of this two part K/A. Per authority of NUREG 1021, ES401, Section D.2.a., second paragraph [When selecting or writing questions for K/As that test coupled knowledge or abilities (e.g., the A.2 K/A statements in Tiers 1 and 2 and a number of generic K/A statements, such as 2.4.1, in Tier 3), try to test both aspects of the K/A statement. If that is not possible without expending an inordinate amount of resources, limit the scope of the question to that aspect of the K/A statement requiring the highest cognitive level (e.g., the (b) portion of the A.2 K/A statements) or substitute another randomly selected K/A.], the test question tests the ability to predict the impact of an air dryer malfunction.

SSES Unit 1 tripped following a Main Turbine trip. The Reactor Protection System (RPS) has been RESET. However, the following annunciator has not cleared:

- SCRAM DISCHARGE VOLUME NOT DRAINED (AR-103-001, G02)

Which ONE of the following is a cause for this alarm?

- A BACKUP SCRAM VALVE (SV-147-110B) remained ENERGIZED when RPS was reset.
- **B** ALTERNATE ROD INSERTION BLOCK VALVE (SV-147-101) remained DEENERGIZED when RPS was reset.
- C ALTERNATE ROD INSERTION VENT VALVE (SV-147-099) remained DEENERGIZED when RPS was reset.
- **D** One or more SCRAM PILOT SOLENOID VALVES remained ENERGIZED when RPS was reset.

Answers: A B C D References Provided to Applicant: Justification	Questior	ו Numb	er: 54	•			
CHOICE (A) - YES The B/U Scram Vvs energize to vent the I/A header and allow the scram valves to reposition. CHOICE (B) - No WRONG: ARI Vvs ENERGIZE to cause a scram on ATWS-RPT (L2 or High Pressure) - independent of RPS and would not have actuated on the given scram condition. VALID DISTRACTOR: These valves would hold the scram valves open if they were energized. CHOICE (C) - No WRONG: ARI Vvs ENERGIZE to cause a scram on ATWS-RPT (L2 or High Pressure) - independent of RPS and would not have actuated on the given scram condition. VALID DISTRACTOR: These valves would hold the scram valves open if they were energized. CHOICE (D) - No WRONG: The Scram Pilot Solenoid Valves are normally energized and are DEENERGIZED to cause a scram. VALID DISTRACTOR: These valves could hold the scram valves open they were deenergized. NOTE: the SDV is filling from the CRD charging header through the scram valves. The scram valves are held open because SV-147-110B (B/U Scram Valve) is energized (held open by an energized solenoid). Complete the following statement concerning the ACTIVITY CONTROL CARDS in the Reactor Manual Control System (RMCS).

The cards . . .

A ... work in conjunction with various Control Rod Block initiating systems to determine when a Control Rod motion block is required.

B ... control the directional control valves and returns information concerning the present state of the Hydraulic Control Unit (HCU).

C ... sample all Hydraulic Control Units (HCU) for information concerning the status of all valves and controls.

D ... compare REQUEST signals to ensure MATCH and supervises MODES of operation.

57 RO SRO Question ID: 29627 Origin: New Demory Level

SSES Unit 1 is in Mode 5 with the Reactor Mode Switch locked in REFUEL. It is necessary to withdraw one Control Rod to support routine Technical Specification Surveillance requirements.

Which ONE of the following correctly describes operation of the Rod Worth Minimizer for this activity?

- A The Rod Worth Minimizer (RWM) is AUTOMATICALLY BYPASSED when the Reactor Mode Switch is NOT in RUN.
- **B** The Rod Worth Minimizer (RWM) is MANUALLY BYPASSED by rotating the RWM Keylock Bypass Switch to BYPASS.
- **C** The Rod Worth Minimzer (RWM) permits withdrawal of a single rod if the Control Room Operator selects "Rod Test" at the RWM Main Display.
- **D** The Rod Worth Minimzer (RWM) permits withdrawal of multiple rods if the Control Room Operator selects "Rod Test" at the RWM Main Display.

Answers: A B C D B References Provided to Applicant:	
CHOICE (A) - No WRONG: This is NOT an automatic bypass VALID DISTRACTOR: Applicant could reasonably believe this to be true given that a "Refuel Position One-Rod-Out" interlock exists.	
CHOICE (B) - No WRONG: RWM Keylock Bypass Switch can only be used in the following two instances: The RWM Bypass Switch can be used by the operator to override active RWM rod blocks during any operating condition. There are administrative controls regarding the use of the RWM Bypass function in NDAP-QA-0338 (Reactivity Management and Control Program), Technical Specifications and Emergency Operating Procedures (EOPs). NDAP-QA-0338 permits bypassing for Special Tests. This is not a Special Test.	
During a failure to SCRAM (ATWS) condition, execution of EOPs EO-000-113, "Level/Power Control" in the section for Control Rod Insertion, there is a step requiring this switch to be placed in the bypass position. This is not an EOP directed activity	
VALID DISTRACTOR: This would work but is ADMINISTRATIVELY impermissible.	
CHOICE (C) - YES The ROD TEST function allows single rod withdrawal.	
CHOICE (D) - No WRONG: Selecting a second rod with one already withdrawn causes a Select Error, an Insert Block and a Withdraw Block. VALID DISTRACTOR: this works for one, and only one, control rod under these conditions.	
References TM-OP-031D TS 3.9.2 OP-131-001 NDAP-QA-0338 SO-156-003 GO-100-006	
Comments and Question Modification History	
✓ GXJ ✓ THF ✓ RJC □ SSES	
Gil 09/26/05 - K/A mismatch. The question is about system interlocks, not administrative requirements. "A" and "D" look implausible to me. RWM has to work in RUN. Everyone should know only one rod can be withdrawn in REFUEL. R: need to beef up link to Administrative requirements. Disagree on plausibility of A and D. AUTO bypass is plausible if you understand that the RWM is not the primary means of enforcing the one rod out requirement. D is weaker but permits psychometric balance. Also somewhat plausible if you know that the RWM can be bypassed and that bypassing it allows multiple rods to be moved. Only error is method of bypassing.	
Satisfied with "A". Gil is not satisfied that this addresses the "administrative requirements" associated with refueling. However, the K/A requires a nexus between the RWM and refueling administrative requirements. The ROD TEST function is the only nexus I am aware of. Therefore, added second part of question concerning ONE-ROD-OUT Interlock functional test.	
09/28/05: SSES is considering how to better include administrative requirements.	
Todd 10/05/05 - may not be RO unless L.O. exists to memorize test frequency. R - deleted second part of question concerning TSS frequency.	
Returning to original concept - nexus between RWM and Refueling Admin - this hits it by testing the Applicant's knowledge of the RWM Keylock Bypass Switch. Use of the keylock is ADMINSTRATIVELY prohibited.

58 ☑ RO ☑ SRO Question ID: 29672 Origin: New ☑ Memory Level

Which ONE of the following correctly describes the operation of Reactor Recirculation System (RRS) valves when starting a Reactor Recirculation Pump (RRP)?

A The RRS Recirculation Pump Trip (RPT) breakers will close if:

- the ASSOCIATED RRP Suction Valve HV-F023A or B is 100% OPEN and

- the ASSOCIATED RRP Discharge Bypass Valve HVF-32A or B is 100% OPEN.

- the ASSOCIATED RRP Discharge Valve HV-F031A or B will OPEN when the RRP reaches rated speed.

B The RRS Motor-Generator Drive Motor breaker will close if:

- the ASSOCIATED RRP Suction Valve HV-F023A or B is 100% OPEN and

- the ASSOCIATED RRP Discharge Valve HV-F031A or B is 100% CLOSED.

- the ASSOCIATED RRP Discharge Valve HV-F031A or B will OPEN when the RRP reaches rated speed.

C The RRS Recirculation Pump Trip (RPT) breakers will close if:

- the ASSOCIATED RRP Suction Valve HV-F023A or B is 100% OPEN and
- the ASSOCIATED RRP Discharge Valve HV-F031A or B is 100% CLOSED and
- the ASSOCIATED RRP Discharge Bypass Valve HVF-32A or B is 100% OPEN.
- **D** The RRS Motor-Generator Drive Motor breaker will close if:
 - the ASSOCIATED RRP Suction Valve HV-F023A or B is 100% OPEN and
 - the ASSOCIATED RRP Discharge Valve HV-F031A or B is 100% CLOSED and
 - the ASSOCIATED RRP Discharge Bypass Valve HVF-32A or B is 100% OPEN.

59 RO SRO Question ID: 29703 Origin: Mod 🗌 Memory Level

SSES Unit 2 is operating at 49% reactor power on a SINGLE Recirculation Loop with the following conditions:

- Reactor Recirculation Pump (RRP) "B" is secured.
- Reactor Recirculation Pump (RRP) speed is 80%.
- Rods are withdrawn to 80% (80% Rod Line).

The SCOOP TUBE of RRP "A" fails and repositions itself to the LOWER ELECTRICAL STOP.

Which ONE of the following correctly describes:

- (1) the expected change in core flow and
- (2) Operator actions required to mitigate this event?
- A (1) Core Flow will INCREASE and
 (2) Lower RRP Speed to 80% or be in Mode 3 within 12 hours.
- B (1) Core Flow will DECREASE and
 (2) Raise RRP Speed or Insert Control Rods to Exit Stability Region II
- C (1) Core Flow will INCREASE and
 (2) Lower RRP Speed to 80% or enter Technical Specification 3.0.3 immediately.
- D (1) Core Flow will DECREASE and
 (2) Reduce RRP Speed or Withdraw Control Rods to Exit Stability Region II

Question	Number:	59

Justificati	on			
	Flow will decrease.	believes speed inc	- creases, there is a	TS limit on how the speed.
CHOICE (E	3) - YES			
	C - No Flow decreases. TRACTOR: Applicant m	nay go to 3.0.3 if sp	beed can't be reduc	ed.
	D - No further speed reduction TRACTOR: mirror imag		oushes plant into R	egion I - worsens the situation

60 I I RO I SRO Question ID: 29630 Origin: Mod I I Memory Level

Both SSES Units are operating at full power. SSES Unit 1 loses Reactor Building Closed Cooling Water (RBCCW) when the in-service heat exchanger fouls. Without Operator action (e.g., the standby heat exchanger is NOT placed in service) which ONE of the following will occur next?

A INSTRUMENT AIR PANEL 1C140 A, B SYSTEM TROUBLE (AR-124-001, D01)

B CONTAINMENT DRWL CLG LOOP B HI TEMP (AR-112-001, E03) will annunciate.

C RWCU FILTER INLET HI TEMP ISO (AR-101-001, A01) will annunciate.

D CRD PUMP A TRIP (AR-107-001, D01).

Question Number: 60 c 🔽 Α В Answers: References Provided to Applicant: Justification CHOICE (A) - No WRONG: IA Compressors are TBCCW load VALID DISTRACTOR: Potential alarm on loss of TBCCW CHOICE (B) - No, set point is 150 deg F. WRONG: RWCU NRHX is RBCCW's largest heat load, comprising 80% of the system load. VALID DISTRACTOR: RBCCW is backup to RB Chilled Water system. RB Chilled Water cools the Drywell Coolers. CHOICE (C) - YES. Set point is 145 deg F. CHOICE (D) - No. WRONG: CRD Pp Brg and Gear Oil cooler are TBCCW loads VALID DISTRACTOR: could occur on loss of TBCCW. References TM-OP-014 ON-114-001 Alarm Responses **Comments and Question Modification History** 🗹 RJC 🗹 GXJ 1. Gil 09/26/05 - Is this a loss of RBCCW flow or a rise in RBCCW temperature due to loss of SW flow? If the RBCCW flow is normal albeit with elevated temperature it may be possible that "A" or "B" could occur first. Depends on the alarm/trip set points for each. R: neither. It's a rise in RBCCW temperature caused by fouling in the heat exchanger. If inaccurate, will change to loss of RBCCW flow. 09/28/05 phone conversation with SSES => better use distracters that are NOT RBCCW loads to be certain that the distracters are absolutely wrong. 2. Todd 10/05/05 - editorial changes to stem. 3. Rich 10/09/05 - careful with need to check answer out on simulator. R: no longer necessary because all wrong distracters were replaced with impossible answers. (2 TBCCW loads and 1 Chilled Water load). Gil's concern no longer at issue because of changes above. Both units are at full power when SSES Unit 2 receives the following alarm:

- CRD PANEL 2C007 HI TEMP (AR-103-001, H05).

On panel 1C601, you observe the following:

- COOLING WATER HEADER FLOW (FI-C12-2R605) reads 63 gpm. - RPV-CRD DRIVE WATER DIFF (PDI-C12-2R602) reads 250 psi.

Which ONE of the following caused the alarm?

- A Cooling Orifices of the affected CRD are too large.
- **B** The Scram Outlet Valve of the affected CRD has an internal leak.
- C CRD pressure is too low.
- **D** CRD Cooling Water Header Flow is too low.

63 🛛 🗹 RO 🖉 SRO Question ID: 29633 Origin: New 🗌 Memory Level

SSES Unit 1 has recently completed a routine Technical Specification Surveillance of the High Pressure Coolant Injection (HPCI) system. Residual Heat Removal (RHR) loop "B" is in the Suppression Pool Cooling (SPC) and Suppression Pool Spray (SPS) mode. A small steam leak develops on SSES Unit 1 and raises Drywell Pressure to 1.5 psig. At the Unit Supervisor's direction, the Operating Crew manually initiates Divisions I and II LOCA signals.

(1) What effect does this have on SSES Unit 1 RHR system?

Subsequently, the leak worsens and Reactor Pressure Vessel level lowers and stabilizes at -140 inches.

(2) What must the Operating Staff do to initiate Drywell Spray?

- A (1) RHR Loop "A" starts in the LPCI mode. RHR Loop "B" automatically reconfigures to the SPS mode ONLY.
 (2) Depress the RHR LOOP B INIT SIG RESET PUSHBUTON (HS-151-1S56A/B) and manually reconfigure the selected RHR loop.
- B (1) RHR Loop "A" starts in the LPCI mode. RHR Loop "B" automatically reconfigures to the LPCI mode.
 (2) Place LOCA ISOLATION MANUAL OVERRIDE (HS-E11-1S17B) to OVERRIDE and manually reconfigure the selected RHR loop.
- C (1) RHR Loop "A" starts in the LPCI mode. RHR Loop "B" automatically reconfigures to the SPS mode ONLY.
 (2) Place LOCA ISOLATION MANUAL OVERRIDE (HS-E11-1S17B) to OVERRIDE and manually reconfigure the selected RHR loop.
- **D** (1) RHR Loop "A" starts in the LPCI mode. RHR Loop "B" automatically reconfigures to the LPCI mode.

(2) Depress the RHR LOOP B INIT SIG RESET PUSHBUTON (HS-151-1S56A/B) and manually reconfigure the selected RHR loop.

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (A) - No WRONG: This switch will NOT clear the LOCA signal because the low level is still present (below -129) VALID DISTRACTOR: mirror imaging.
CHOICE (B) - YES
CHOICE (C) - No WRONG: RHR Loop "B" auto reconfigs to LPCI. VALID DISTRACTOR: correct switch.
CHOICE (D) - No WRONG: This switch will NOT clear the LOCA signal because the low level is still present (below -129) VALID DISTRACTOR: correct effect on RHR.

Comments and Question Modification History
🗹 GXJ 🗹 THF 🗹 RJC 🗆 SSES
1. Gil 09/26/05 - what is TAF (-XXX")? "C" not plausible at -140". There may, also be a cue from another question to help answer this.

R: 366.3 inches from bottom of RPV. Instrument zero is 527.5 inches. 527.5 minus 366.3 yields 161.2 inches. Therefore, TAF is ~ -161. Don't know what other question is cuing the Applicant. Unclear why "C" is implausible.

Changed A & C to auto reconfigure to SPS only to improve plausibility.

The following Lesson Objectives support this question:

181 Describe the following Residual Heat Removal System design features and interlocks, including initiating signals, setpoints, automatic actions, and control logic, as applicable:

- a. Automatic LPCI initiation/injection
- v. Suppression Pool cooling
- w. SDC actions on LPCI initiation

10495 Predict the Residual Heat Removal System response to manipulation of the following controls: d. LOCA isolation manual override switches

Unable to adequately test both ability to predict and use procedures of this two part K/A. Per authority of NUREG 1021, ES401, Section D.2.a., second paragraph [When selecting or writing questions for K/As that test coupled knowledge or abilities (e.g., the A.2 K/A statements in Tiers 1 and 2 and a number of generic K/A statements, such as 2.4.1, in Tier 3), try to test both aspects of the K/A statement. If that is not possible without expending an inordinate amount of resources, limit the scope of the question to that aspect of the K/A statement requiring the highest cognitive level (e.g., the (b) portion of the A.2 K/A statements) or substitute another randomly selected K/A.], the test question tests the ability to predict the impact of an air dryer malfunction.

ON-164-003, REACTOR RECIRCULATION PUMP DUAL SEAL FAILURE, directs closing of RRP suction valve HV-143-F023A/B BEFORE closing the RRP discharge valve HV-143-F031A/B because it ensures ...

- A Reactor Water Cleanup (RWCU) suction will limit the leak rate to containment to less than 420 gpm.
- B RRP suction valve will close without exceeding its design limit of 50 psid.

C nominal 500 psid across the Lower #1 Seal will NOT be exceeded.

D RRP Discharge valve HV-143-F031A/B will close with additive force.

 WRONG: If at full power, d/p is 500 psi VALID DISTRACTOR: Applicant may believe that the suction is at lower pressure CHOICE (D) - No WRONG: discharge pressure of unaffected RRP does NOT affect closing force of affected discharge valve. VALID DISTRACTOR: Applicant may believe that discharge of unaffected loop assists closure in this condition. References ON-164-003 Comments and Question Modification History I CXJ I THF I RJC SSES Gil 09/28/05: Confirm the RWCU suction is between the RRP suction valve and the pump. Otherwise this distracter is implausible. R: per SSES Dwgs M-143 and 144, the suction is between the RRP and its associated suction valve. Which ONE of the following activities would REQUIRE implementation of the Temporary Modification process per NDAP-QA-1218?

A Installation of a GAGGING DEVICE on an Air Operated Valve which normally FAILS OPEN.

B Place Diesel Engine Driven Fire Pump (0P511) in "MAN A" because it starts intermittently when no automatic start is required. Engineering and Maintenance have determined that the inadvertent starts will NOT occur while 0P511 is in manual.

C Install tygon tubing to drain piping downstream of a leaking Fire Service deluge valve. This is necessary to prevent inadvertent actuation of the deluge valve until permanent repairs can be made.

D Replace component labels on the Residual Heat Removal system.

Answers: A B C	D References Provided to Applicant:
Justification	
CHOICE (A) - No WRONG: NDAP-QA-0323 controls this.	
CHOICE (B) - No WRONG: VALID DISTRACTOR:	
CHOICE (C) - YES	
CHOICE (D) - No WRONG: per SSES, this would not require a T.mod	j.
References	
NDAP-QA-1218 TM-OP-013	
Comments and Question Modification History	
GXJ THE RJC	
Need SSES to closely study distracters to ensure the	ney are NOT potentially correct.

Need input on whether to provide copies of each of these NDAP procedures as references.

Gil 09/28/05: Confirm "Standard Blocking Practices" includes the use of yellow tags, otherwise pick a procedure that is closer to using temporary changes/modifications. Also consider that the use of yellow tags may be required for this situation and makes "B" another correct answer.

Availability of these procedures should NOT be necessary. It should be fair game that the applicant's know which procedure to go to. On second thought this may make the question SRO only.

R: will query SSES on this

Todd 10/05/05 - agree that this may be SRO level question. Check with SSES to determine if it is fair for an RO.

SQ 11/04/05 - SSES agrees that this is SRO level only and, more importantly, considers all four answers correct to some degree. Suggests revising to "Which of the following would require implementation of the Temporary Modification process?".

R - Saved original question as 681.

73 RO SRO Question ID: 29642 Origin: Bank Demory Level

A rapid loss of condenser vacuum from 100% power has resulted in the following plant conditions:

- Reactor power is 25%.
- Standby Liquid Control (SBLC) is injecting.
- Main Steam Isolation Valves (MSIVs) are closed.

- Reactor Pressure Vessel (RPV) Pressure is being controlled between 800 to 1,000 psig with Safety Relief Valves (SRVs).

- High Pressure Coolant Injection (HPCI) and Reactor Core Isolation Cooling (RCIC) are NOT available.

- RPV level is -165 inches and can NOT be restored nor maintained above -161 inches.

Which ONE of the following actions are required?

A Stop injection from all sources EXCEPT Control Rod Drive (CRD) and SBLC and perform a rapid depressurization.

B Stop all injection and continue steam cooling until RPV water level reaches -205 inches.

C Open SRVs to lower pressure to 600 psig and maximize injection with Table 15 systems.

D Stop injection from all Table 15 systems and perform a rapid depressurization.

74 RO SRO Question ID: 29644 Origin: Mod

Memory Level

SSES Unit 2 has the following conditions:

- A Reactor Scram condition is present.
- 24 Control Rods are at Position 04.
- All other Control Rods are at Position 00.
- Reactor Pressure Vessel level is stable at +35 inches.
- IRMs are not yet fully inserted.

What is the status of the Reactor?

A The Reactor IS shutdown and WILL remain shutdown under ALL conditions without Boron.

B The Reactor IS shutdown but will NOT remain shutdown under ALL conditions without Boron.

- C The Reactor IS shutdown but MAY NOT remain shutdown (indeterminate). Need input from Reactor Engineering.
- **D** The Reactor is NOT shutdown and will NOT remain shutdown under ALL conditions without Boron.

Question	Number: 7	74	
Answers:	A B	C D V	References Provided to Applicant:
Justification			
no more than one shutdown and ex	e rod position is gre pected to remain s	eater than 00. Alternatively, which have a set of the s	o remain shutdown under all conditions without Boron if with more than one rod above position 00, the Reactor is without Boron if all Control Rods are inserted to the or SSES Unit 2, the MSBWP is 02.
	Unit 2 MSBWP is ()2. Here, 24 rods are at posi uld erroneously apply Unit 1	ition 04. data to Unit 2. Good question on unit differences.
CHOICE (B) - No WRONG: the Re VALID DISTRAC under all conditio	actor can NOT be TOR: Applicant co	deemed shutdown under all uld erroneously believe that	conditions the Reactor is S/D but not assured to remain shutdown
VALID DISTRAC	ctor can NOT be d		the Reactor will remain S/D even though it's not currently

Which ONE of the following correctly describes EO-000-103 requirements for HPCI and RCIC operation with Suppression Pool level below 17 feet and the basis for any differences?

- A RCIC operation may continue to operate because the RCIC turbine exhaust is within the Primary Containment Vent capacity.
- **B** RCIC operation must be isolated at the same time as HPCI to minimize Primary Containment pressure rise.
- **C** RCIC operation may continue ONLY if it is the LAST available source of high pressure coolant injection to ensure adequate core cooling.
- **D** RCIC operation may continue IF Suppression Pool Spray is on to condense RCIC turbine exhaust steam.

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (A) - YES
CHOICE (B) - No WRONG: Not true. VALID DISTRACTOR: RCIC and HPCI have similar designs.
CHOICE (C) - No WRONG: The EOP does NOT say this. Rather, RCIC is expected to trip on high backpressure BEFORE HPCI does. VALID DISTRACTOR: Reasonable to believe that EOPs would preserve last source of HP injection.
CHOICE (D) - No WRONG: RCIC and HPCI have similar designs. VALID DISTRACTOR: Reasonable to believe they could affect each other adversely.

77 RO SRO Question ID: 29652 Origin: Mod Demory Level

Both units are operating at 90% of full rated power. SSES Unit 2 Main Steam Isolation Valves (MSIV) on the "D" steam line (B21-F022D and B21-F028D) inadvertently close. All systems, structures and components (SSC) operate as expected.

Which ONE of the following

(1) correctly describes the plant response and

(2) the required Operator response?

A (1) The reactor MAY scram on APRM high flux or Main Steam line high flow.
 (2) Reduce power per GO-200-012, POWER MANEUVERS.

B (1) The reactor MAY scram on RPV low level or Main Steam line high flow.
 (2) Recover the plant per ON-284-001, MAIN STEAM LINE ISOLATION AND QUICK RECOVERY

C (1) The reactor WILL scram on APRM high flux or RPV high pressure.
 (2) Enter EO-200-102, RPV CONTROL.

D (1) The reactor WILL scram on MSIV closure or RPV low level.
 (2) Perform ON-200-100, SCRAM, SCRAM INNIMENT.

78 | RO SRO Question ID: 29653 Origin: New Demory Level

The control room has been evacuated and, as Unit Supervisor, you are directing SSES Unit 2 operations from the Remote Shutdown Panel. The following conditions exist:

- Suppression Pool temperature is 96 degrees Fahrenheit and steady.
- Residual Heat Removal (RHR) pump 2P202A is running
- RHR is operating in the Suppression Pool Cooling (SPC) and Suppression Pool Spray (SPS) mode.
- The Drywell is being vented through the Standby Gas Treatment System (SGTS).
- Drywell Pressure is 1.7 psig and lowering.
- Reactor Pressure Vessel (RPV) pressure is 90 psig and slowly lowering.
- Reactor Pressure Vessel (RPV) water level is 60 inches and rising.
- You have directed the PCO to establish RPV water level above 90 inches and below 100 inches.

Which ONE of the following correctly describes your priorities?

- A Reconfigure RHR loop "A" to the Drywell Spray mode.
- **B** Maintain Suppression Pool Cooling and Spray using either RHR loop.
- **C** Reconfigure RHR loop "A" to the Shutdown Cooling mode using RHR pump 2P202A only.
- **D** Locally start RHR pump 2P202C and use RHR loop "A" to provide SPC, SPS & Shutdown Cooling concurrently.

79 RO SRO Question ID: 29654 Origin: Bank Memory Level

A spent fuel bundle just removed from the Reactor Vessel has been dropped into the Fuel Pool. Health Physics reports that general area dose rates on the Refuel Floor are 1,200 millirem (1.2 Rem) to 1,400 millirem (1.4 Rem) per hour.

The "B" channel of the Refuel Floor High Exhaust duct monitor and the Refuel Floor Wall Exhaust duct monitors do NOT respond to the increased radiation levels.

(1) The radioactive release caused by the dropped fuel bundle will be

- (2) What is the minimum initial emergency classification level?
- A (1) . . . less than 10 CFR 100 (REACTOR SITE CRITERIA) limits.
 (2) ALERT.
- B (1) . . . greater than Updated Final Safety Analysis Report (UFSAR) values.
 (2) UNUSUAL EVENT.
- C (1) ... less than 10 CFR 20 (STANDARDS FOR PROTECTION AGAINST RADIATION) limits.
 (2) ALERT.
- (1) . . . less than 10 CFR 50.72 (IMMEDIATE NOTIFICATION REQUIREMENTS FOR OPERATING NUCLEAR POWER REACTORS) limits.
 (2) UNUSUAL EVENT.

80 RO SRO Question ID: 29665 Origin: Bank Demory Level

A seismic event has occurred and the following conditions exist on SSES Unit 1:

- Complete loss of offsite power (LOOP).
- Steam leak inside the drywell.
- ESS bus1C (1A203) is deenergized due to a fault.
- All ON-100-101 (SCRAM, SCRAM IMMINENT) actions are complete.
- Reactor Pressure Vessel (RPV) LEVEL is 27 inches and lowering at 2 inches per minute.
- Reactor Pressure Vessel (RPV) PRESSURE is 720 psig and lowering.
- Drywell (DW) TEMPERATURE is 255 degrees Fahrenheit and rising at 5 degrees per minute.
- Drywell (DW) PRESSURE is 9 psig and rising.
- Suppression Pool (SP) TEMPERATURE is 104 degrees Fahrenheit.
- Suppression Pool (SP) PRESSURE is 8 psig and rising.

Which ONE of the following describes the next required action?

- A RHR Pumps will be continuously needed for Adequate Core Cooling.
- **B** Perform a Rapid Depressurization
- **C** Initiate Suppression Pool (SP) Cooling.
- D Initiate Drywell (DW) Spray.

Answers:		8	<u>c</u>		References Provided to Applicant:

82 RO SRO Question ID: 29668 Origin: New Demory Level

Instrumentation and Controls (I&C) is performing a Technical Specification Surveillance on Reactor Protection System (RPS) train "B" (Division II).

1. RPS train "B" is currently deenergized (half-scram) pursuant to the aforementioned surveillance.

- 2. Average Power Range Monitor (APRM) "E" is mistakenly taken out of OPERATE.
- 3. RPS train "A" remains energized.
- 4. The plant remains at full power.

As Unit Supervisor, you must . . .

- A ... enter ON-100-101, SCRAM, SCRAM IMMINENT at step 3.1.
- **B** ... enter EO-103-113 SH2, CONTROL ROD INSERTION at step CR-1.
- C ... enter EO-100-113 SH1, LEVEL/POWER CONTROL at step LQ-1.
- **D** ... enter EO-100-102, RPV CONTROL, at step RC-1.

Answers:	A	В	C 🗌 🛛		References Provided to Applicant:

83 RO SRO Question ID: 29707 Origin: Bank Demory Level

SSES Unit 2 is at 40% of rated power. Main Condenser back-pressure readings over the next ten minutes are as follows:

- 1 Minute 4 in HG absolute
- 2 Minutes 8 in HG absolute
- 4 Minutes 10 in HG absolute
- 6 Minutes 12 in HG absolute
- 8 Minutes 14 in HG absolute
- 10 Minutes 23 in HG absolute

When and why should the Unit Supervisor direct the Primary Control Operator to manually scram the Reactor?

AFTER the Main Turbine trips to prevent opening of Turbine Bypass Valves.

- **B** AFTER the Main Turbine trips ONLY IF the Reactor fails to scram automatically.
- **C** BEFORE the Main Turbine trips to prevent forcing an automatic protective action.
- **D** BEFORE the Main Turbine trips because an automatic reactor scram will not occur at this power level.

Answers:	A B		References Provided to Applicant:

SSES Unit 1 is at full rated power. SSES Unit 2 is in Mode 5 for an unplanned refueling outage. You are the Unit 2 Unit Supervisor and are responding to a Standby Gas Treatment System (SGTS) Exhaust Ventilation Hi-Hi alarm per ON-070-001, ABNORMAL GASEOUS RADIATION RELEASE/CAM ALARMS.

The Shift Manager has just declared an ALERT based on RA1.

As Unit Supervisor, you . . .

- A ... stop implementation of ON-070-001, ABNORMAL GASEOUS RADIATION RELEASE/CAM ALARMS and enter EO-200-105, RADIOACTIVITY RELEASE CONTROL.
- **B** ... remain in ON-070-001, ABNORMAL GASEOUS RADIATION RELEASE/CAM ALARMS and enter EO-200-105, RADIOACTIVITY RELEASE CONTROL .
- C ... stop implementation of ON-070-001, ABNORMAL GASEOUS RADIATION RELEASE/CAM ALARMS and enter EO-200-103, PRIMARY CONTAINMENT CONTROL.
- **D** . . . remain in ON-070-001, ABNORMAL GASEOUS RADIATION RELEASE/CAM ALARMS and enter EO-200-103, PRIMARY CONTAINMENT CONTROL.

Answers:		B

85 RO SRO Question ID: 29671 Origin: Bank Demory Level

OSCAR has been dispatched as a result of an unisolable primary to secondary containment leak on SSES Unit 1. A cool down is in progress with the MSIVs closed. Standby Gas Treatment System is in service with the following parameters:

- Secondary Containment differential pressure is -0.31 inches WG.
- SGTS SPING Noble Gas is 1.0E06 (1,000,000) micro curies per minute.
- OSCAR whole body dose readings are 0.05 millirem per hour.

A siding panel fails on the Refuel Floor. Secondary Containment differential pressure now indicates 0 inches WG.

- (1) How do SPING readings relate to the offsite release rate and
- (2) How will OSCAR whole body dose readings respond to the panel failure?
- A (1) SBGT SPING Noble Gas is NOT representative of the Total Offsite Release.
 (2) OSCAR whole body dose readings will increase.
- B (1) SBGT SPING Noble Gas is NOT representative of the Total Offsite Release.(2) OSCAR whole body dose readings will NOT change.
- **C** (1) SBGT SPING Noble Gas IS representative of the Total Offsite Release. (2) OSCAR whole body dose readings will increase.
- D (1) SBGT SPING Noble Gas IS representative of the Total Offsite Release.
 (2) OSCAR whole body dose readings will NOT change.

	AV B		References Provided to Applicant:
Justification

86 | □RO 🗹 SRO Question ID: 29674 Origin: Mod 🗌 Memory Level

SSES Unit 2 is in Mode 2. The following conditions exist:

- all Intermediate Range Monitors (IRM) read approximately 65 on Range 2.
- Source Range Monitor (SRM) "A" reads 1.9E5 (190,000) counts per second (cps).
- Source Range Monitor (SRM) "B" is BYPASSED
- Source Range Monitor (SRM) "C" reads 2.0E5 (200,000) counts per second (cps).
- Source Range Monitor (SRM) "D" reads 2.1E5 (210,000) counts per second (cps).
- Reactor Period on all four SRMs is approximately 400 seconds.
- Reactor Engineering requests additional control rod withdrawal to continue raising Reactor power.

Which ONE of the following is correct?

- A Control Rods may be withdrawn when ALL Division I IRMs are on Range 3. Technical Specification requirements for SRMs are satisfied.
- **B** Control Rods can be withdrawn when ANY Division I IRM is on Range 3. Suspend Control Rod withdrawal immediately.
- **C** Control Rods may be withdrawn when ALL Division II IRMs are on Range 3. Technical Specification requirements for SRMs are satisfied.
- **D** Control Rods can be withdrawn when ANY Division II IRM is on Range 3. Suspend Control Rod withdrawal immediately.

Justificati	on				
	SRM "D" >		RMCS rod block. ay confuse Divisio		o byp when associated IRMs go to R3. nents.
	SRM "D" >				o byp when associated IRMs go to R3 - ALL of them. nents. Applicant may overreact to TS issue.
CHOICE (C) - YES				
	nust have a		iated IRMs on R3 puld misunderstan		peration. Applicant may overreact to TS issue.

87 | RO SRO Question ID: 29675 Origin: New Memory Level

Both Units are at full rated power. The Control Room receives the following alarm:

- RAILROAD ACCESS HI HI RADIATION (AR-016-001, F12)

The CRO reports that Zone 3 Exh Railroad Access Shaft Radiation Monitor (RR-D12-1R608) reads 5.2 millirem per hour and is slowly trending up. Operators report from the Upper and Lower Relay Rooms that RISHH-D12-1K616A read 5.4 and 5.3 millirem per hour respectively. Maintenance is staging equipment in the Railroad Access Shaft and Reactor Building Zone 3 is open to the Railroad Access Shaft. Control Room Operators are NOT able to establish communication with personnel working in the Railroad Access Shaft.

As Shift Manager, you must direct the Unit Supervisor to __(1)__ for the purpose of __(2)__:

- A (1) Enter EO-100-104 and ES-070-001,
 (2) Isolating Zone 1 Reactor Building HVAC and initiating SGTS.
- B (1) Enter EO-100-104 and ES-070-001,
 (2) Isolating Zone 3 Reactor Building HVAC and initiating SGTS.
- C (1) Enter EO-100-104 and ON-159-002,
 (2) Isolating Zone 3 Reactor Building HVAC and initiating SGTS.
- D (1) Enter EO-100-104 and ON-134-003
 (2) Isolate the Railroad Access Shaft by restoring HVAC to normal.

Question Number: 87	
	References Provided to Applicant:
Justification	
CHOICE (A) - No WRONG: Need to isolate Zone 3. VALID DISTRACTOR: Correct procedures.	
CHOICE (B) - YES	
CHOICE (C) - No WRONG: EO-100-104 directs the user to the ON to confirm ISO/INIT and VALID DISTRACTOR: Correct EO, correct strategy and the ON can direct	
CHOICE (D) - No WRONG: Wrong strategy. Goal is to ISO RB HVAC. VALID DISTRACTOR: Correct EO and goal is to isolate the radiation.

10 CFR 55.43 (b)(4)

🗹 EXJ

Gil 10/16/05 - The RAILROAD ACCESS is an area rad monitor, not exhaust monitor (does not match K/A). Looks like "B" is wrong and "C" is correct.

SSES S

R - "C" is not correct because there has been no AUTO initiation of Zone III isolation and SGTS. Uncertain about K/A match. The RB HVAC system responds to the RR access area monitor to prevent a release. Per SSES materials, the initiators are EXHAUST ducts.

Todd/Rich 10/31/05 - editorial changes

88 RO SRO Question ID: 29623 Origin: Bank Memory Level

SSES experienced a seismic event. Consequently, a loss of offsite power (LOOP) occurred. Both units have establish Reactor Pressure and Inventory control using Reactor Core Isolation Cooling (RCIC). All 4.16 kVAC and 480 VAC ESS buses are energized within 10 seconds.

One hour later, the Control Room Operators are investigating a slow rise in Drywell Pressure on SSES Unit 1. Conditions rapidly deteriorate and the following conditions develop:

- Emergency Service Water (ESW) pumps 0P504 B, C, D are running.

On SSES Unit 1:

- Drywell Pressure is 2.1 psig.
- Reactor Pressure Vessel pressure is 395 psig.
- Residual Heat Removal (RHR) pumps 1P202 B, C, D are running.
- Core Spray (CS) pumps 1P206 B, C, D are running.

On SSES Unit 2:

- Control Rod Drive (CRD) pump 2P132A is running.

- Reactor Building Chiller 2K206A is running.

Which ONE of the following describes the cause of these conditions and the required actions?

A Emergency Diesel Generator (EDG) Supply Breaker (1A20104) OPENED and RECLOSED for LOAD SEQUENCING. Perform ON-104-201, LOSS OF 4KV BUS 1A (1A201) or ON-204-201, LOSS OF 4KV BUS 2A (2A201) to energize either buss.

- B Emergency Diesel Generator (EDG) "A" Output Breaker tripped open. Perform ON-104-201, LOSS OF 4KV BUS 1A (1A201) and ON-204-201, LOSS OF 4KV BUS 2A (2A201) to energize both busses.
- C Emergency Diesel Generator (EDG) "A" tripped. Perform ON-024-001, DIESEL GENERATOR TRIP.
- D Emergency Diesel Generator (EDG) Supply Breaker (1A20104) tripped OPEN. Perform ON-104-201, LOSS OF 4KV BUS 1A (1A201).

90 RO SRO Question ID: 29676 Origin: Mod Demory Level

During the Monthly Diesel Generator Operability Test of EDG "B" per SO-024-001, a minor oil leak from the Woodward Governor was discovered. The plan to repair this leak is to run EDG "B" unloaded per OP-024-001 while Maintenance evaluates and repairs the leaky fitting under a minor maintenance activity. According to Engineering, the leak rate is independent of generator load. After two hours and ten minutes, the repair is successful.

Which ONE of the following describes the actions, if any, required before stopping and returning EDG "B" to standby status?

- A Immediately shutdown EDG "B". Loading is NOT required because the EDG ran unloaded for less than 6 hours.
- **B** Immediately shutdown EDG "B" to minimize causes of accelerated component wear.
- C Load EDG "B" to greater than 3,000 KW for 30 minutes as post maintenance testing.
- **D** Load EDG "B" to greater than 3,000 KW for 30 minutes to minimize causes of accelerated component wear.

Question Nu	umber: 90			
Answers: A	вс	D		References Provided to Applicant:

91 RO SRO Question ID: 29677 Origin: New Demory Level

SSES Unit 2 is at full rated power with Average Power Range Monitor (APRM) "E" bypassed. APRM "D" fails DOWNSCALE.

Which ONE of the following is the LEAST limiting response with respect to Limiting Conditions for Operation (LCO) and permissible under Technical Specifications?

A Bypass APRM "D" to restore Rod Block Monitoring (RBM) OPERABILITY.

B Bypass Rod Block Monitoring (RBM) "B" and enter a 5 day time clock per LCO 3.3.2.1.A

- C Operators should direct I&C to place Rod Block Monitoring (RBM) "B" in TRIP within 48 hours per LCO 3.3.2.1.B
- **D** Operator action is not required because the failed APRM automatically bypasses the associated Rod Block Monitor (RBM).

97 RO SRO Question ID: 29684 Origin: New Demory Level

A failure of transmitter TT-11305 has forced the Control Room to take manual control of Service Water Temperature Control Valve TV11028 at Temperature Controller TIC-11028 on panel 1C668. With this configuration, Operators are able to maintain RBCCW Heat Exchanger outlet temperature at the normal value of 90 degrees Fahrenheit. Adjustments are generally infrequent and predictable. Auxiliary Operators report RBCCW heat exchanger outlet temperature hourly from local indicators TI-11307A/B because the failed transmitter also causes the Control Room to lose RBCCW HX DISCH TEMP TI-11305 indication and disables RBCCW HEADER HI TEMP alarm (AR-123-E05).

As Unit Supervisor, you are reviewing the AR to repair TT-11305. What is the CLASSIFICATION and PRIORITY of this work?

- A Classification is Corrective Maintenance (A) Priority is 1, work that should be scheduled and started within 24 hours.
- **B** Classification is Corrective Maintenance (A) Priority is 2, schedule at earliest opportunity within four weeks (short cycle)
- C Classification is Elective Maintenance (B) Priority is 3, schedule at next available system window.
- **D** Classification is Elective Maintenance (B) Priority is 4, schedule as resources allow within the normal 13-week schedule process.

Answers: A B C D References Provided to A	oplicant:

100 | 🗆 RO 🗹 SRO Question ID: 29686 Origin: Bank 🗹 Memory Level

A reactor startup is in progress on SSES Unit 2 when the following conditions develop:

- Reactor Pressure Vessel (RPV) is 45 psig.
- CRD PUMP A TRIP (AR-107-001, D01) annunciates.
- CRD ACCUMULATOR TROUBLE (AR-107-001, H06) annunciates.
- CRD 32-21 Accumulator Trouble Light on the Full Core Display illuminates.
- An Auxiliary Operator reports that Accumulator 32-21 pressure is 930 psig and slowly lowering.
- CRD 32-21 is at notch position 32.

The required action to IMMEDIATELY __(1)__ is based on inadequate pressure available to ensure __(2)__.

- A (1) Start CRD pump 1P132B; then fully insert control rod 32-21 and declare it INOPERABLE (2) that the control rod would insert following a scram.
- **B** (1) Start CRD pump 1P132B; then fully insert control rod 32-21 and declare it INOPERABLE (2) that the control rod can be driven.
- C (1) Scram the Reactor per ON-155-007, LOSS OF CRD SYSTEM FLOW and ON-100-101, SCRAM, SCRAM IMMINENT.
 (2) that the control rod would insert following a scram.
- D (1) Scram the Reactor per ON-155-007, LOSS OF CRD SYSTEM FLOW and ON-100-101, SCRAM, SCRAM IMMINENT.
 (2) that the control rod can be driven.

Question Number: 1 C 🗌 В Answers: A References Provided to Applicant: Justification CHOICE (A) - No WRONG: VALID DISTRACTOR: Plausible if the Applicant does not understand that the operating loop system characteristic changes when in single RRP operation. The operating RRP will have a lower flow resistance because it can now discharge into the ten idle jet pumps in addition to the core inlet plenum. CHOICE (B) - NO WRONG: VALID DISTRACTOR: Plausible if the Applicant does not fully understand how the core flow signal is developed. The individual jet pump flow transmitters produce signals before they are summed to determine total core flow. FY-1K607 is substituted for FY-1K606 if a RRP generator exciter breaker is open or discharge valve is less than 90% open. FY-1K607 subtracts the idle loop jet pump flow from operating loop jet pump flow to determine actual core flow (operating loop flow less backflow through the idle loop). CHOICE (C) - NO WRONG: VALID DISTRACTOR: Plausible if the Applicant does not understand that the idle loop jet pumps have no method of backflow prevention or if the Applicant misunderstands signal development. CHOICE (D) - Yes References **Comments and Question Modification History** ✓ SSES 🗹 GXJ M THF 🗹 R.C 1. (HB 09/08/05) Mod from INPO Bank QuestionID 20448 (Quad Cities exam in August 2001) 2. Given the following conditions:

- SSES Unit 1 recently entered Mode 4 to start a refueling outage following a 500 day run.
- SSES Unit 2 is in mode 1 at full power and flow.
- The station experiences a loss of Startup Transformer T-20.

Which ONE of the following actions must be accomplished on Unit 2, in a short amount of time to prevent damage to major plant equipment?

A Restore Power to RPS Buss "A"

- B Restore Power to RPS Buss "B"
- C Restore the CRD System to service
- D Start the ESW system

.......

Answers: A B C D References Provided	to Applicant:
Justification	
CHOICE (A) - NO WRONG: does not de-energize	
CHOICE (B) - YES T-20 causes loss of RPS "B".	
CHOICE (C) - NO Will not cause major damage in short amount of time.	
CHOICE (D) - NO WRONG: EDGs should NOT have started. ESW required to cool EDGs.

4 🔽 RO 🗹 SRO Question ID: 28348 Origin: New 🗌 Memory Level

SSES Unit 1 is refueling. Fuel shuffles are in progress and a bundle is ready to be lowered into the reactor vessel when the Control Room receives the following indications:

- IRM CHAN B/D/F/H UPSCALE TRIP OR INOP (AR-104-001/A06)
- SRM UPSCALE OR INOP (AR-104-001/B06)
- 24V DC PANEL 1L680 SYSTEM TROUBLE (AR-106-001/B13)
- REMOTE SHUTDOWN PANEL 1C201 INSTR PWR FAILURE (AR-106-001/H16)
- Source Range Monitors "B" and "D" fail DOWNSCALE.

Which of the following is the correct response for the Control Room operating crew?

- A Stop all fuel movement after placing any suspended bundle in a safe location and enter ON-175-001, LOSS OF 24 VDC BUS.
- B Continue fuel movement and enter ON-175-001, LOSS OF 24 VDC BUS.
- **C** Stop all fuel movement after placing any suspended bundle in a safe location and enter ON-081-002, REFUELING PLATFORM OPERATION ANOMALY.
- **D** Continue fuel movement and enter ON-081-002, REFUELING PLATFORM OPERATION ANOMALY.

SSES Unit 2 is at full rated power when Stator Coolant begins leaking into the Main Generator. This causes a Generator Neutral Overvoltage (59GN) fault.

Which ONE of the following correctly describes the expected sequence of plant events?

- A 1. Concurrent trip of both Stator Cooling Water pumps and the Main Turbine,
 - 2. Generator Lockout Relays trip,
 - 3. Reactor Scram.
- B 1. Concurrent trip of both Stator Cooling Water pumps and Generator Lockout Relays, 2. Reactor Scram,
 - 3. Main Turbine trip.
- C 1. Concurrent trip of both Stator Cooling Water pumps and the Main Turbine, 2. Generator Lockout Relays trip,

 - 3. Reactor Scram.
- D 1. Concurrent trip of both Stator Cooling Water pumps and Generator Lockout Relays,
 - 2. Main Turbine trip,
 - 3. Reactor Scram.

· ____

_

Answers: A B C	D		References Provided to Applicant:
Justification			
CHOICE (A) - NO WRONG: Turbine does not trip with Stator Co VALID DISTRACTOR: combination of correct			n.
CHOICE (B) - NO WRONG: The scram does NOT precede the VALID DISTRACTOR: Correct start and rease Sink).	Turbine T onable to	rip. believe logic	would force scram (Heat Source) before trip (Heat
CHOICE (C) - NO WRONG: Pumps and Turbine are NOT the in VALID DISTRACTOR: tests knowledge of wh	itiator (s/t ether the	o Pumps and trip causes a	Generator). GENERATOR or TURBINE trip.
CHOICE (D) - YES

Ten minutes after a reactor scram late in core life the steady state Reactor Pressure has risen from about 955 psig to almost 960 psig.

Which of the following caused this?

- B EHC Steam Pressure Regulator "A" (PT10101A) failed low.
- **C** Both Reactor Feed Pumps (RFP) tripped.
- D EHC Steam Pressure Regulator "A" (PT10101A) failed high.

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (C) - NO WRONG: VALID DISTRACTOR: Plausible because a high failure will cause a plant depressurization because the HVG will pass the full OPEN signal to the TBVs.
CHOICE (B) - YES This failure will cause EHC to maintain a new steady state pressure 3 psig GREATER THAN the pre-failure steady state pressure.
CHOICE (A) - NO WRONG: VALID DISTRACTOR: Plausible if the Applicant believes that reactor coolant throughput is reduced; thereby causing a slight pressure drop. Alternatively, the Applicant may conclude that the tripped RFP reduces steam flow such that pressure goes down. In fact, should a RFP trip, the EHC system will respond to maintain steady state pressure per program.
CHOICE (D) - NO WRONG: VALID DISTRACTOR: Plausible because this is redundant to PT10101A and an Applicant may incorrectly conclude that the signal will bias the output of the HVG somehow. However, this failure will cause a plant depressurization because the HVG will pass the full OPEN signal to the TBVs.

7 RO SRO Question ID: 28352 Origin: Bank I Memory Level

What is the DESIGN BASIS for disabling control room controls when control is transferred from the Control Room to the Remote Shutdown Panel per ON-100-009, PLANT SHUTDOWN FROM OUTSIDE THE CONTROL ROOM?

- **A** To prevent unauthorized component operation from the Control Room.
- **B** To prevent spurious component operation caused by hot shorts.
- **C** To simplify design and construction of the Remote Shutdown system.
- **D** To minimize time to evacuate the Control Room once deciding to evacuate.

. _____

.

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (B) - YES
CHOICE (A) - NO WRONG: VALID DISTRACTOR: Plausible because it does fulfill the purpose proposed by this distracter. However, the design reason is to prevent spurious hot short operation.
CHOICE (C) - NO WRONG: VALID DISTRACTOR: Plausible because it may simplify design and construction of the RSD system. However, the design reason is to prevent hot short operation.
CHOICE (D) - NO WRONG: VALID DISTRACTOR: Plausible because it may minimize evacuation time. However, the design reason is to prevent hot short operation.

The plant is at 100% power when a loss of Reactor Building Closed Cooling Water (RBCCW) occurs.

With NO Operator action, which of ONE of the following will occur and why?

- A Inboard MSIVs will close because Containment Instrument Gas is lost when RBCCW is lost.
- **B** Outboard MSIVs will close because Instrument Air is lost when RBCCW is lost.
- **C** Inboard MSIVs will close due to Main Steam Tunnel High Temperature when RBCCW is lost.
- **D** Outboard MSIVs will close due to Main Steam Tunnel High Differential Temperature when RBCCW is lost.

_

. ----

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (A) - YES CTMT Inst Gas compressors cooled by RBCCW.
CHOICE (B) - NO WRONG: IA compressors are cooled by TBCCW. VALID DISTRACTOR:
CHOICE (C) - NO WRONG: Tunnel coolers cooled by SW (Secondary CTMT). Moreover, Hi Tunn Temp closes ALL MSIVs. VALID DISTRACTOR:
CHOICE (D) - NO WRONG: Tunnel coolers cooled by SW (Secondary CTMT). Moreover, Hi Tunn Diff Temp closes ALL MSIVs. VALID DISTRACTOR:

9 RO 🗹 SRO Question ID: 28355 Origin: New 🗹 Memory Level

SSES Unit 2 is at full power with the following conditions:

- "A" Containment Instrument Gas compressor (2K205A) is in LEAD
- "B" Containment Instrument Gas compressor (2K205B) is in STANDBY
- "A" Instrument Air compressor (2K107A) is in LEAD
- "B" Instrument Air compressor (2K107B) is in STANDBY
- "A" Service Air compressor (2K108A) is in LEAD
- "B" Service Air compressor (2K108B) is in STANDBY

The plant suffers a loss of Bus 2A201. Which of the following correctly describes the plant response:

- A PCV-22560 will open, allowing the Service Air system to supply Instrument Air system loads.
- **B** Service Air compressor 2K108B will start and cycle between 118 psig and 127 psig.
- C Instrument Air compressor 2K107B will start and cycle between 87 psig and 102 psig.
- **D** Containment Instrument Gas compressor 2K205B will start and cycle between 152 psig and 170 psig.

SSES Unit 2 Operators are responding to a High Drywell Pressure condition by venting the drywell per OP-273-003, Primary Containment Nitrogen Makeup and Venting. There is no failed fuel and the Containment atmosphere is below minimum detectable activity (MDA). How does the method of Drywell venting per Section 2.3 of OP-273-003, Venting Drywell, prevent an UNMONITORED and UNCONTROLLED release to assure radiation exposures remain as low as reasonably achievable (ALARA)?

The Drywell is vented . . .

- A ... to the Standby Gas Treatment Exhaust Vent via the Standby Gas Treatment system.
- **B** ... to the Zone 3 Filtered Exhaust via the Recirculation Plenum.
- **C** ... to the SSES Unit 2 Filtered Exhaust via the Recirculation Plenum.
- **D**... to the SSES Unit 2 Turbine Building Filtered Exhaust via the Ambient Offgas Charcoal system.

13 RO SRO Question ID: 29695 Origin: Bank Memory Level

The following conditions exist on SSES Unit 1:

- A successful automatic reactor scram occurred on high reactor pressure.
- MSIVs are closed but the Main Condenser is available.
- The PCO is attempting to stablize RPV pressure between 950 and 1,000 psig using SRVs.
- Suppression Pool Temperature is 92 degrees Farenheit and slowly rising.

Re-establishing the Main Condenser as a heat sink is . . .

- A ... PERMITTED if NO valid MSIV isolation signal exists.
- **B** ... NEVER permitted UNLESS primary containment integrity is in jeopardy.
- **C** ... REQUIRED immediately after bypassing and resetting any valid MSIV isolation signal.
- **D** ... PERMITTED if NO SRV is available.

14 RO SRO Question ID: 29696 Origin: Mod Demory Level

A Main Generator trip and an Auxiliary Buss load shed occurred while SSES Unit 2 was operating at 100% power. The following conditions exist:

- A failure to scram occurred.
- Initial Reactor power was 4%.
- SRVs are cycling to maintain Reactor Pressure.
- Drywell pressure is 18 psig.
- Drywell Temperature is 149 degrees Farenheit.
- Suppression Pool water level is 31 feet.
- Suppression Pool Temperature is 135 degrees Farenheit.

Which ONE of the following states the required Operator action and the basis of that action?

- A Perform an emergency cooldown using the Main Turbine Bypass Valves to prevent the impulse load on the Supression Pool from exceeding design loads.
- **B** Perform a rapid depressurization using the SRVs to ensure Primary Containment vent valve opening pressure will not be exceeded following RPV depressurization.
- **C** Transfer HPCI suction from the Condensate Storage Tank to the Suppression Pool to prevent further Suppression Pool water level increase.
- **D** Reduce Reactor pressure using SRVs and stop HPCI and RCIC to prevent operation with water in the turbine exhaust lines.

15 RO SRO Question ID: 29576 Origin: Bank 🗌 Memory Level

SSES Unit 1 has a Loss of Coolant Accident (LOCA) and the following plant conditions exist:

Given the above conditions, which of the following actions is required by the operating crew per EO-200-103, PC CONTROL?

A Go To EO-100-112, Rapid Depressurization.

B Initiate Drywell Spray.

- **C** Go To EO-100-114, RPV Flooding.
- **D** Shutdown All Drywell Coolers and Fans.

18 RO SRO Question ID: 29660 Origin: New C Memory Level

SSES Unit 1 has an Anticipated Transient Without Scram (ATWS). The control room operating crew initiate Standby Liquid Control (SBLC) per LQ/Q-3. You observe the following:

- "A" SBLC Pump RED indicating light ILLUMINATES,
- "B" SBLC Pump RED indicating light does NOT illuminate,
- ONE SBLC SQUIB READY A-B White indicating light extinguishes,
- ONE SBLC SQUIB READY A-B White indicating light remains energized,
- SBLC SQUIB VALVES LOSS OF CKT CONTINUITY (A03) Energizes.

What actions, if any, are necessary to establish REQUIRED flow (86 gpm)?

- A OPEN the second SBLC SQUIB Valve to establish sufficient flow path for full flow.
- **B** START the "B" SBLC Pump to establish full pumping capacity.
- **C** INJECT Boron with HPCI IAW ES-150-002 to establish full flow.
- **D** No action is necessary because a single pump and valve will provide rated flow.

Answers:	A B	С 🗌 D		References Provided to Applicant:]
Justification					
New - inspired b	y Browns Ferry 2 e	xam of September	2001 (Quest	on ID 21039)	
approximately 8	6 gpm. In this case will energize wher	e, the flow rate is or	ne-half of exp	blowing an ATWS. The expected flow rate is acted (43 gpm) because one SBLC pump failed ave been injected. This will occur in 155 divided	to by

19 RO 🗹 SRO Question ID: 29580 Origin: New 🗹 Memory Level

A truck carrying Chlorine is involved in an accident on Route 11 outside the Main Access Road to the site. How will the Control Structure HVAC system protect control room operators from toxic gas?

A The system will automatically shift to the RECIRULATION MODE. Correct configuration and operation is then verified per ON-159-001 (ON-259-002), Containment Isolation.

B The system can be manually started in the RECIRCULATION MODE per OP-030-002, Control Structure HVAC, by placing Control Structure Manual Isolation switches HS-07802A1 and HS-07802B1 to "ISO" and then starting CREOASS Fan OV101A or OV101B.

C The system can be manually started in the PRESSURIZATION/FILTRATION MODE per OP-030-002, Control Structure HVAC, by placing Emergency Outside Air Intake Radiation Monitor mode switches RISHH-D12-0K618A and RISHH-D12-0K618B to "TRIP TEST".

D The system will automatically shift to the PRESSURIZATION/FILTRATION MODE. Correct configuration and operation is then verified per ON-159-001 (ON-259-002), Containment Isolation.

RO RO SRO Question ID: 29698 Origin: New Memory Level # 21

SSES Unit 2 is at full rated power. Reactor Pressure Vessel (RPV) water level is steady at 35 inches. You observe the following steady state conditions:

- Reactor Feed Pump "A"
 - running at 4,000 rpm and
 - pumping 3.7E6 lbm/hour (3,700,000 lbm per hour).
- Reactor Feed Pump "B"
 - running at 5,000 rpm and
 - pumping 4.6E6 lbm/hour (4,600,000 lbm per hour).
- Reactor Feed Pump "C"
- running at 4,000 rpm and
- pumping 3.7E6 lbm/hour (3,700,000 lbm per hour).

As PCO, you take RFP B SPD CTL/DEMAND SIGNAL SIC-C32-2R601B to MANUAL and attempt to reduce the speed of the "B" Reactor Feed Pump. There is no response.

What MUST your next action be per ON-145-001, RPV LEVEL CONTROL SYSTEM MALFUNCTION?

▲ Lower RFPT B MTR SPD CHANGER using HS-22730B1 SLOW pushbutton until the Reactor Feed Pump slows down.

- B Place FW LEVEL CTL/DEMAND SIGNAL LIC-C32-2R600 in MANUAL and attempt to reduce Reactor Feed Pump speed.
- C Place FWLCS in Single Element Control by pressing the Green 1 ELEM pushbutton for 1 OR 3 ELEMENT LEVEL CONTROL HS-206102.
- **D** Swap the controlling level channel by depressing available channel pushbutton for SELECT LVL A OR B HS-C32-2S01.

24 RO SRO Question ID: 29594 Origin: New C Memory Level

SSES Unit 1 was operating at full power when the Main Turbine tripped. However, the Reactor did NOT scram. Control Rod 22-27 is selected and to be inserted per EO-100-113, Control Rod Insertion.

The following plant conditions exist:

- all Average Power Range Monitors (APRMs) indicate approximately 24% Reactor Power.
- the RSCS ROD INS BLK BYPASS HS-55601 is in NORMAL (WHITE light illuminated)

On the Rod Sequence Control System (RSCS) Operator Display Unit (ODU), you observe the following:

- AMBER DISPLAY UNIT pushbutton lower light (FREE ROD) illuminated.
- Control Rod 22-27 AMBER light emitting diode (LED) is illuminated.
- RED DISPLAY UNIT pushbutton lower light (BYPASS) illuminated.
- Control Rod 22-27 RED light emitting diode (LED) is illuminated.

Which one of the following describes the status of control rod 22-27?

Control Rod 22-27 can . . .

- ▲ ... be INSERTED because power is above the Low Power Set point (LPSP).
- **B** . . . be INSERTED because it is BYPASSED.
- C NOT be INSERTED because the RSCS ROD INS BLK BYPASS HS-55601 is in NORMAL.
- **D** NOT be INSERTED because power is below the Low Power Set point (LPSP).

Answers:		В	<u> </u>				References Provided to Applicant:	
Justification

25 RO SRO Question ID: 29663 Origin: Mod SRO Level

SSES Unit 1 is in MODE 5 for a planned refueling outage and fuel movement is in progress. SSES Unit 2 is in MODE 4 to support emergent maintenance. The Control Room receives the following alarms and Indications:

- REFUEL FLOOR WALL EXH MON HI RADIATION (AR-212-001, D01)
- RR-D12-2R605 reads 19.2 millirem per hour (mR/hr)
- REFUEL FLOOR HI EXH HI RADIATION (AR-212-001, F02)
- REFUEL FLOOR HI EXHAUST HI HI RADIATION (AR-206-001, E03)
- RR-D12-2R607 reads 19.8 millirem per hour (mR/hr)

Which ONE of the following is the correct evacuation and reason?

- A Evacuate both Refuel Floor areas because the Refuel Floor areas are common to both units.
- **B** Only evacuate Unit 1 Refuel Floor areas because fuel movement is in progress only on Unit 1.
- C Evacuate both Refuel Floor areas because radiation levels in 2 areas have exceeded MAX NORMAL.
- **D** Evacuate both Refuel Floor areas because radiation levels in 2 areas have exceeded MAX SAFE.

-

26 RO SRO Question ID: 29596 Origin: Mod 🗌 Memory Level

Both units are at full power. SSES Unit 1 has isolated and is draining Residual Heat Removal (RHR) loop "B" for planned maintenance. SSES Unit 1 RHR loop "B" is draining to the floor drain to the Reactor Building Sump via 161121 (RHR Pump B & D Room Drain Iso VIv.).

SSES Unit 1 Receives the following alarms and indications:

- RHR LOOP B PUMP ROOM FLOODED (AR-113-001, H08).
- SUPPRESSION POOL DIV 1 LO LEVEL (AR-111-001, E02).
- SUPP POOL LEVEL LI-25755A indicates 22.4 feet and slowly lowering.
- SUPPRESSION POOL DIV 2 LO LEVEL (AR-112-001, E02).
- SUPP POOL LEVEL LI-15755B indicates 22.3 feet and slowly lowering.
- REACTOR BLDG SUMP LEVEL HI-HI (AR-125-001, B01)

(1) How will Suppression Pool level respond?

(2) What Emergency Operating Procedure (EOP) entry conditions are CURRENTLY met?

(1) The Suppression Pool will continue to drain until 161121 (RHR Pump B & D Room Drain Iso VIv.) is closed.
 (2) EO-100-104, SECONDARY CONTAINMENT CONTROL.

- B (1) The Suppression Pool will continue to drain until 161121 (RHR Pump B & D Room Drain Iso VIv.) is closed.
 (2) EO-100-103, PC CONTROL.
- C (1) Suppression Pool will continue to drain until draining of RHR loop "B" is stopped by closing the open vents & drains.
 (2) EO-100-104, SECONDARY CONTAINMENT CONTROL.
- D (1) Suppression Pool will continue to drain until draining of RHR loop "B" is stopped by closing the open vents & drains.
 (2) EQ-100-103 RC CONTROL

(2) EO-100-103, PC CONTROL.

Answers: A B C D References Provided to Applicant:
Justification
CHOICE (A) - NO WRONG: SP will not continue to drain because the Unit 1 and 2 floor drains are not cross-connected. VALID DISTRACTOR: Correct EOP and each unit's ECCS room floor drains are cross-connected to other ECCS room of the same unit.
CHOICE (B) - NO WRONG: PC CONTROL requires SP level below 22 feet. However, the SP will not continue to drain because the Unit 1 and 2 floor drains are not cross-connected. VALID DISTRACTOR: The stem conditions give sufficient information to correctly conclude that the Suppression Pool will stabilize at 17 feet (Table 18 of EO-100-103). Therefore, Applicant may reasonably select this.
CHOICE (C) - YES Table 18 of EO-100-103 tells us that SP will stabilize at 17 feet. EO-100-104 requires entry on RB Water Level above high alarm.
CHOICE (D) - NO WRONG: PC CONTROL requires SP level below 22 feet. VALID DISTRACTOR: Correct SP level. The stem conditions give sufficient information to correctly conclude that the Suppression Pool will stabilize at 17 feet (Table 18 of EO-100-103). Therefore, Applicant may reasonably select this.

Following a loss of coolant accident, the Primary Containment Hydrogen and Oxygen (H2O2) Analyzers are placed in service per OP-173-001, Section 2.8, H2O2 ANALYZER OPERATION DURING EMERGENCY. The following conditions exist:

- Analyzer "A" is aligned to the SUPPRESSION POOL.
- Analyzer "A" O2 reads 2%.
- Analyzer "A" H2 reads 9%
- Analyzer "B" is aligned to the DRYWELL.
- Analyzer "B" O2 reads 6%
- Analyzer "B" H2 reads less than 1%
- Sample flow to both analyzers was restored 35 minutes ago.
- Both analyzers are on the 10% range.

Which ONE of the following statements is correct?

All Hydrogen Recombiners, Drywell Fans and Drywell Coolers MUST . . .

- **A** ... be Operated to adequately mix the Primary Containment atmosphere.
- **B** ... be Operated to adequately recombine Hydrogen in the Primary Containment atmosphere.
- **C** ... be Shutdown because Hydrogen and Oxygen concentrations are above combustible limits.
- **D**... be Shutdown because Hydrogen and Oxygen concentrations can NOT be determined.

Justification CHOICE (A) - NO				References Provided to Applicant:
WRONG: ÉO-100-10 the gases are in the s	ame CTMT section ED-103-113 calls	or not becau	ise migration i	rs be secured when H2>6% AND O2>5% whether s possible. g for the individual CTMT sections (SP or DW) given

28 RO SRO Question ID: 29598 Origin: Bank 🗹 Memory Level

Given that the following conditions occur in the specified sequence:

- 1. All required conditions for Automatic Depressurization System (ADS) actuation were met.
- 2. Automatic depressurization is in progress.
- 3. All low pressure ECCS pumps trip.
- 4. A single Core Spray (CS) pump is restarted.

Which ONE of the following describes how the Automatic Depressurization System (ADS) is affected?

A Automatic depressurization STOPS when low pressure ECCS pumps trip; then AUTOMATICALLY reinitiate after the CS pump restarts.

- **B** Automatic depressurization CONTINUES until the LOGIC TIMER RESET pushbutton is depressed.
- C Automatic depressurization CONTINUES until both MANUAL INHIBIT (S34A & S34B) switches are rotated to INHIBIT.
- **D** Automatic depressurization STOPS when low pressure ECCS pumps trip; then can be MANUALLY reinitiated after the CS pump restarts.

 Suppression Pool Cooling Available
 RHR Pump "B" and "D" Minimum Flow Isolation Available

Answers: A B C D References Provided to Applicant:
Justification
De-energizing 2B226 removes power from the following: - HV251F016B - Drywell Spray (Normally Shut) - HV251F017B - Injection (Normally Open) - HV251F028B - SP Spray & Cooling (Normally Shut) - HV251F010B - Cross-connect to "A" loop (Normally Shut) - HV251F004B - "B" Pump suction from SP (Normally Open) - HV251F006B - "B" Pump suction from SDC dropline (Normally Open) - HV251F003B - "B" HX Outlet (Normally Open) - HV251F0047B - "B" HX Inlet (Normally Open)
 Therefore, the following applies" Low Pressure Coolant Injection (LPCI) - Operable because de-energized valves in the flow path are normally open (HV251F015B is on swing buss 2B229) Drywell Spray Mode - NOT Available because normally closed valve F016B is de-energized Suppression Pool Spray - NOT Available because normally closed valve F028B is de-energized Suppression Pool Cooling - NOT Available because normally closed valve F028B is de-energized RHR Pump "B" and "D" Minimum Flow - Available because normally closed valve F027B is energized from 2B229
CHOICE (A) - YES
CHOICE (B) - No WRONG: DW Spray NOT avail because F016B deenergized. SP Spray NOT avail because F028B deenergized. VALID DISTRACTOR: LPCI is Operable, Min Flow is available and SP Cooling NOT Avail.
CHOICE (C) - No WRONG: LPCI is Operable. Remainder of distracter mirrors Distracter B VALID DISTRACTOR: Remainder of distracter mirrors Distracter B
CHOICE (D) - No WRONG: LPCI is Operable. Remainder of distracter mirrors Distracter D VALID DISTRACTOR: Remainder of distracter mirrors Distracter B

Comments and Question Modification History
🗹 EXJ 🔽 THF 🗹 RJC 🗆 SSES
Gil 09/26/05 - Suggest use "Available" (or not available) rather than "Operable". Not sure what impact the bus loss will have on Operability, however availability is assured in A. R: accepted.
Todd 09/30/05 - deleted LPCI mode to limit variables to four. modified distracters accordingly.
SQ 10/17/05 - Memorized Load List is trivial. Operations would not de-energize 2B226. R - change to loss due to fault and provide Applicant with Load List. Specifically, provide Applicants with copy of ON- 204-202.
Note that SSES Lesson Objective supports this question: 10499 State the power supply to the following Residual Heat Removal System Components: a. Residual Heat Removal Pumps b. RHR motor-operated valves c. LPCI initiation logic d. RHR valve control logic

SSES Unit 1 is at full power when the Unit 1 High Pressure Coolant Injection (HPCI) inadvertently initiates and injects to the Reactor Pressure Vessel (RPV). Assuming no Operator action, which ONE of the following correctly describes the INITIAL change from steady state?

Thermal Power will RISE and . . .

A RPV Water Level will LOWER and Total Steam Flow will LOWER and Total Indicated Feedwater Flow will LOWER

B RPV Water Level will LOWER and Total Steam Flow will RISE and Total Indicated Feedwater Flow will LOWER

C RPV Water Level will RISE and Total Steam Flow will LOWER and Total Indicated Feedwater Flow will RISE

D RPV Water Level will RISE and Total Steam Flow will RISE and Total Indicated Feedwater Flow will LOWER
