U.S. Department of Transportation Federal Aviation Administration

Office of Air Traffic Organization

800 Independence Ave., SW. Washington, DC 20591

May 12, 2006

Mr. George Pangburn, Director Division of Nuclear Materials Safety U.S. Nuclear Regulatory Commission, Region I 475 Allendale Road King of Prussia, PA 19406

õ 32

200% NAV 15

Dear Mr. Pangburn:

I am writing to convey to the Nuclear Regulatory Commission (NRC) the final actions taken by the Federal Aviation Administration (FAA), National Aeronautical Charting Group (NACG) to locate five (5) photographic film static eliminator bars containing a small quantity of Americium 241. I reported the missing bars to Mr. Arlon Costa at NRC Headquarters (301-816-5100) on February 23, 2006, Event Notification Number: 42369.

Status: Originally, NACG possessed nine (9) static eliminator bars produced by NRD LLC (company name) of Grand Island, New York. NACG apparently once used the bars on photo processing equipment to support the production of aeronautical charts. NRD confirmed that it had delivered nine (9) such bars of varied length to NACG in the early 1980s. {NACG was a U.S. Department of Commerce (DOC), National Oceanic and Atmospheric Administration (NOAA) organization until transferred to FAA in FY2000.} After an exhaustive search by NACG and DOC personnel on at least four different occasions over the last two months, only four (4) of the NRD static eliminator bars have been located, leaving five (5) unaccounted for.

NRD Static Eliminator Bar Information:

<u>Serial No</u> .	<u>Radiation</u> (mCi: milliCuries)	Bar Length	<u>Disposition</u>
SA2199 SA2200	25.875 mCi 20.250 mCi	71" 54"	Found at NACG/DOC; returned to NRD Found at the Mostoller Landfill, PA; returned to NRD
SA2201 SA2202	20.250 mCi 20.250 mCi	54" 54"	Found at NACG/DOC; returned to NRD Found at the Mostoller Landfill, PA; Returned to NRD
SA2203 SA2204 SA2205 SA2206 SA2207	20.250 mCi 18.000 mCi 18.000 mCi 6.750 mCi 6.750 mCi	54" 48" 48" 18" 18"	Missing Missing Missing Missing Missing

Background:

In early February 2006, an NACG employee working at the NACG printing facility in the basement of the U.S. DOC, Herbert C. Hoover Building (HCHB), Washington, D.C., discarded two NRD static eliminator bars (NRD bars) in the HCHB trash compactor. The serial numbers for the two bars are: SA2200 and SA2202. The employee was engaged in cleaning up NACG's workspace as part of NACG's relocation to a new printing and distribution facility. NACG had resided in HCHB since the 1930s.

NACG employees were using the HCHB trash compactor, also located in the basement of HCHB, as a primary receptacle for cleanup debris. At some point in early February, the two NRD bars were discarded in the trash compactor. On February 10, 2006, a DOC contractor transported the trash compactor contents, including the two NRD bars, to the Mostoller Landfill in Cambria County, Pennsylvania. Because Mostoller does not have a permit to receive radioactive waste, the landfill is equipped with a gate alarm to detect radioactive material entering the facility. Mostoller's radiological gate alarm was reportedly triggered when trash from the HCHB trash compactor entered the landfill.

Reacting to the alarm, Mostoller staff called Applied Health Physics (AHP), a local contractor, to separate the contractor's load from the HCHB trash compactor. Mostoller also asked AHP to identify and monitor the radioactive source, and decontaminate the site if necessary. AHP subsequently discovered that one of the NRD bars was bent/damaged. Additional survey work by AHP revealed that the two NRD bars had not contaminated any part of the landfill. Therefore, no decontamination of the landfill was required. AHP took possession of both static eliminator bars discovered at the landfill and coordinated with NACG to have the bars returned to NRD. NACG paid AHP for its landfill survey work and to ship the static eliminator bars (SA2200 and SA2202) to NRD. NRD accepted both static eliminator bars at no cost to NACG or AHP.

Mostoller also contacted the Pennsylvania Department of Environmental Quality and NRC. An investigation of the shipping box label and contact with NRD led NRC to contact DOC as the possible source of the bars. On February 14, 2006, senior DOC environmental and occupational safety and health (EOSH) personnel contacted NACG management about the Mostoller incident. Based on additional information on the shipping box label, NACG management then confirmed that NACG was the source of the NRD bars discovered entering the Mostoller Landfill. On February 17, I was designated as FAA's point-of-contact (POC) for coordinating all aspects of the agency's response to the discovery of the two NRD bars at the landfill. As of the date of this letter, I have participated in the coordination of, and have authorized payment for, all activities related to this issue as described below:

Activities:

- 1. During the period of February 17-24, 2006, notified NRC (Mr. Craig Gordon, Region I), FAA, DOC, Mostoller, and AHP senior personnel that I was FAA's POC for coordination and payment of services related to the NRD bars.
- 2. Reported the Mostoller Landfill incident to NRC Headquarters on February 23, 2006, as described above.
- Coordinated with DOC EOSH officials to secure the services of the U.S Public Health Service, Federal Occupation Health Service (FOH). These services included:
 1) multiple radiological contamination assessment surveys and technical reports associated with the NACG/DOC areas where the radiological bars had been stored;
 2) survey and report of the HCHB trash compactor; 3) coordination to return to NRD the two static eliminator bars (SA2199 and SA2201) found in NACG's area at HCHB, which included "formal chain of custody correspondence;" and 4) final reports (enclosed).
- 4. Coordination with AHP to return to NRD the two static eliminator bars (SA2200 and SA2202) discovered entering the landfill. This has been completed, and NACG has paid AHP for this service.
- 5. Authorized payment to FOH for all services rendered, which included FOH radiological surveys, reports, and coordination of the return to NRD of the two static eliminator bars (SA2199 and SA2201) found at HCHB. The successful return of these two bars has been confirmed.
- 6. Apprised Mr. Gordon, NRC representative, almost daily of my activities related to this matter. Accepted Mr. Gordon's guidance in this matter.
- 7. Arranged for Mr. Gordon to visit NACG and HCHB on March 30, 2006, as part of NRC's ongoing investigation of NACG's static eliminator bars. Mr. Gordon observed the packing and removal from HCHB of the above referenced NRD bars (SA2199 and SA2201), performed a walk-through of the NACG area in HCHB, and held a meeting with FAA and DOC management and EOSH officials and FOH representatives. The purpose of the meeting was to provide Mr. Gordon the opportunity to review the findings of the FOH surveys and reports and to discuss what follow-on actions might be necessary.

Search Activities: As described above, NACG and DOC conducted exhaustive searches for the five (5) missing NRD bars (SA2203-07). These search activities included:

- 1. Separate and joint searches throughout NACG's area in HCHB. Because NACG has now totally vacated HCHB, the final searches were unencumbered by equipment, material, or debris.
- 2. The NACG printing manager found property records from the mid-1990s for photo processing equipment on which the NRD bars might have been installed. During the mid-1990s, this photo processing equipment, to which the NRD bars might have been installed, was excessed and replaced with new photo processors. The property records were shared with NOAA, whose property management office would have accepted the excessed photo processing equipment. Unfortunately, NOAA no longer has property records for the photo processing equipment NACG excessed during the

1990s. Nevertheless, I contacted Melissa Hartman, the past supervisor of the NACG Photo Branch, who was involved with replacing NACG's photo processing equipment in the mid-1990s. Ms. Hartman was unaware of whether or not any radiological equipment was installed on the excessed photo processors. NACG is still using the photo processors purchased by Ms. Hartman. These replacement photo processors do not use radiological static eliminator bars.

Conclusion:

1. Summary of FOH's Phase 2 – Americium 241 Radiological Health Assessment Project Revised Final Report of April 22, 2006:

"The (FOH) findings and results of all samples (instrument and swipe surveys) indicated that the printing plant facility, loading dock, trash compactor and storage closet Room B-911 were free of fixed and removable contamination and qualify for "Unrestricted Use" as specified by the Nuclear Regulatory Commission (NRC) regulations, standards, and guidelines."

"The results of the Radiological Health Safety Assessment indicate that radiation exposures to personnel are well below the guidelines, recommendations, and radiation standards of currently accepted various state, local, federal and national regulatory agencies and therefore do not pose or represent any health hazard or health risk at this time."

- 2. AHP found no contamination to any part of the Mostoller Landfill.
- 3. NACG has made every attempt to locate the five (5) missing NRD static eliminator bars. It is unlikely any of the missing NRD bars (SA2203, SA2204, SA2205, SA2206, and SA2207) will be located.

If you require additional information or action, please contact me at 301-713-2619.

Sincerely,

Terry ML aydon

Ray-Safe Associates Michael Terpilak 1916 Grayslake Drive Silver Spring, MD 20906

Mr. Terpilak,

In regards to the Polonium 210 static eliminator bars. I contacted 3M in Austin, TX about the return of the bars. Mr. Jerry Gosselin responded with the following:

Dear Mr. Keck,

The discontinued products, 3M Static Eliminator Bars, contained radioactive Polonium-210 (Po-210), which decays rapidly to a nonradioactive form. The radioactive half-life is 138.4 days. The Po-210 activity in the maximum activity 3M static eliminator (168 millicuries in an 84 inch long Model 210 or 315 bar) will decay to 0.1 microcuries in 7.9 years from the date of manufacture. The Po-210 activity in the minimum activity 3M static eliminator (4 millicuries in a 2 inch long Model 210 bar) will decay to 0.1 microcuries in 5.9 years from the date of manufacture.

In accordance with the provisions of NRC regulations found in Title 10 of the Code of Federal Regulations, Part 30.18, any device containing less than 0.1 microcuries of Po-210 is exempt form licensing. Further in accordance with the provisions of NRC regulations found in Title 10 of the Code of Federal Regulations, Part 20.1905(a) a container containing less than 0.1 microcuries of PO-210 is exempt form labeling.

Since the 3M Static Eliminator Bars have not been manufactured since 1988 (approximately 18 years ago) any devices that you would have in your possession would have decayed to less than 0.1 microcuries almost ten years ago. At this point there are two options you can consider:

1. Dispose of the device(s) in conventional waste, making sure to completely remove or obscure any remaining radioactive material labels prior to disposal. or

2. Contact 3M Corporate Health Physics Department (located in St. Paul, MN) to request information for the return of the devices to 3M. Ploase contact one of the following personnel: Fred Entwistle 651-736-0740 or Rich Hedlund 651-736-4156

Best regards, Jerry Gosselin 512-984-3149

3M Electronic Solutions Division Austin, TX Technical Service Static Group I informed 3M in Austin, TX and Corporate Health Physics Dept. in St. Paul. MN of my plans to dispose of the bars as conventional waste and supplied them with the serial numbers for their records. Please let me know if any further response is necessary. Please forward this information to the appropriate agency.

Thank you for providing this opportunity to Ecology Services, Inc. We look forward to providing services to you in the future.

Sincerely,

Greg Keck

DEPARTMENT OF HEALTH & HUMAN SERVICES PROGRAM SUPPORT CENTER U.S. PUBLIC HEALTH SERVICES FEDERAL OCCUPATIONAL HEALTH

MEMORANDUM

DATE: April 22, 2006

- TO: Mr. Terry Laydon Safety & Environmental Operations Federal Aviation Administration
- FROM: Mr. Bradley W. Christ Senior Program Manager Federal Occupational Health, U.S. Public Health Service
- SUBJECT: Phase 3 Americium 241 Static Eliminator Bar Transfer Project Concise Summary Report STM # A105952, S117786, P118134
- CC: Mr. Pete Wixted, DoC Mr. Bradley W. Christ, FOH Mr. Michael Terpilak, FOH

Federal Occupational Health (FOH) has completed the coordination of the Phase 3 - Americium 241 Static Eliminator Bar Transfer Project Federal Aviation Administration (FAA) facility located at 14th Street and Constitution Avenue in Washington, DC. The purpose of this project was to coordinate the transfer of 8 Static Eliminator Bars to their respective manufactures in accordance with all Nuclear Regulatory Commission (NRC) requirements and all local, state, federal regulations. The scope of this project included securing the services from a local licensed broker (Ecology Services, Inc.), to package and ship the following Static Eliminator Bars in accordance with Department of Transportation Regulations:

#	DESCRIPTION	SERIAL #	LOCATION
1	NRD Americium-241 Static Eliminator	SA2201	FAA Storage Closet B911
2	NRD Americium-241 Static Eliminator	SA2199	FAA Storage Closet B911
3	3M Polonium-210 Static Eliminator	3M-B00-860	FAA Storage Closet B911
4	3M Polonium-210 Static Eliminator	3M-B00-861	FAA Storage Closet B911
5	3M Polonium-210 Static Eliminator	3M-B00-862	FAA Storage Closet B911
6	3M Polonium-210 Static Eliminator	3M-B00-863	FAA Storage Closet B911
7	3M Polonium-210 Static Eliminator	3M-B00-864	FAA Storage Closet B911
8	3M Polonium-210 Static Eliminator	3M-B00-865	FAA Storage Closet B911

It should be noted that NRD and 3M hold the general NRC licenses for the distribution and sale of these Static Eliminator Bars and at no time were any of these Static Eliminator Bars ever licensed to the FAA or Department of Commerce.

Attached you will find a copy of the chain of custody form. Additionally, FOH has attached pictures depicting the packaging and shipping of the 8 static eliminator bars.

If you have any questions or additional comments please contact me via e-mail or phone (301) 594-4105.

CERTIFICATE FOR TYPE "A" PACKAGING TESTS

This certifies that NRD shipping containers provided to $\boxed{\text{Ecdogy} \text{Services Inc.}}$ Used for the following NRD manufactured models: A001/P001 foils and P2000/A2003 Static Elimination Instruments, are designed and fabricated in compliance with applicable DOT specifications and requirements.

To insure the integrity of this packaging, the containers and their containment are periodically subjected to a series of tests as prescribed by DOT 49 CFR and IAEA Safety Standards.

The results of these tests are satisfactory and demonstrate a high capability to withstand accident conditions in transportation.

IAEA CERTIFICATE OF COMPETENT AUTHORITY SPECIAL FORM RADIOACTIVE MATERIALS CERTIFICATE NUMBER USA/0036/S, REVISION 7

This certifies that the source described has been demonstrated to meet the regulatory requirements for special form radioactive material as prescribed in the regulations of the International Atomic Energy Agency' and the United States of America² for the transport of radioactive materials.

- 1. <u>Source Identification</u> NRD Model A-001.
- 2. Source Description This Special Form material is a laminated metallic foil of silver, gold, and americium dioxide, as shown on NRD Inc. Drawing No. 92A071 (attached). The foil may be single or double. The single foil consists of successive layers of plating, gold, Am-241 and gold, gold, silver, and flash plating for identification. In the double foil the flash plating is replaced by gold, Am-241 and gold, gold, gold, and plating is yellow gold, white gold, or palladium. During transport the material may be in the form of free foils or secured in a variety of holders or mounts.
- 3. <u>Radioactive Contents</u> Americium-241 as an oxide with the activity per foil ranging from less than 0.037 MBq (1uCi) to 2.035 GBq (55 mCi). Activity per unit area does not exceed 0.086 MBq per square millimeter (1500 uCi per square inch).
- 4. <u>Quality Assurance</u> Records of Quality Assurance activities required by Faragraph 310 of the IAEA regulations' shall be maintained and made available to the authorized officials for at least three years after the last shipment authorized by this certificate. Consignors and consignees in the United States exporting or importing shipments under this certificate shall satisfy the requirements of Subpart H of 10 CFR 71.
- 5. Expiration Date This certificate expires August 31, 2007.

1 "Regulations for the Safe Transport of Radioactive Material, 1996 Edition (Revised), No. TS-R-1 (ST-1, Revised)," published by the International Atomic Energy Agency (IAEA), Vienna, Austria.

2 Title 49, Code of Federal Regulations, Parts 100 - 199, United States of America.

(- 2 -)

CERTIFICATE USA/0036/S, REVISION 7

This certificate is issued in accordance with paragraph 804 of the IAEA Regulations and Section 173.476 of Title 49 of the Code of Federal Regulations, in response to the petition and information dated January 31, 2002 submitted by NRD LLC, Grand Island, NY, and in consideration of other information on file in this Office.

MEMORANDUM

DATE: April 22, 2006 TO: Mr. Terry Laydon Safety & Environmental Operations Federal Aviation Administration FROM: Mr. Kiel Fisher Project Manager Federal Occupational Health, U.S. Public Health Service SUBJECT: Phase 2 - Americium 241 Radiological Health Assessment Project **Revised Final Report** CC: Mr. Pete Wixted, DoC Mr. Bradley Christ, FOH Mr. Michael Terpilak, FOH

As directed by the Federal Aviation Administration (FAA), Federal Occupational Health (FOH) has completed the Phase 2 -Americium 241 Radiological Health Assessment Project. The purpose of this project was to post signage, complete a thorough swipe sample evaluation of the contaminated storage closet, and to complete a radiological health assessment using field observations and sample results from FOH site work completed during Phase 1 & 4 Sampling Projects at the facility located at 14th Street and Constitution Avenue in Washington, DC. The scope of this project was limited to a radiological health assessment based on the sample data collected by FOH at the FAA print shop space and dock area on 02/22/06 and NACO Printing Plant Maintenance Shop on 03/08/06.

The final deliverable for this project is the attached report. The final report was submitted to the FAA on time and under budget.

If you have any additional questions or comments, please contact me at (301) 594-9868.

I. EXECUTIVE SUMMARY AND ACTION ITEMS

A radiological health safety assessment of the United States Federal Aviation Administration (FAA) was conducted on February 22, 24 and 27, 2006. Michael S. Terpilak, Certified Health Physicist (CHP) and Kiel W. Fisher, Industrial Hygienist Technician of Public Health Service (PHS), Division of Federal Occupational Health (DFOH), Bethesda Field Office conducted the Radiological Survey.

The initial request was made by Mr. Peter Wixted, Environmental Manager, Department of Commerce, Office of Real Estate on February 21, 2006. Mr. Terry M. Laydon, Safety and Environmental Manager of the FAA is the present contact person.

The purpose of Phase 1 of this project was to conduct immediate on-site sampling to evaluate the presence of Americium-241 contained in the Static Eliminator at the Herbert C. Hoover Building located at 14th Street and Constitution Avenue, Washington, D.C. The scope of Phase 1 of this project was limited to a survey of the FAA print shop space, dock area and trash compactor.

Phase 2 of the project entailed a more comprehensive radiological survey of the storage closet area Room B911 in the basement.

Phase 3 of this project is to package and ship the contaminated Americium-241 and six additional Polonium-210 static eliminators which have already decayed and pose no health hazard and risk, back to the respective manufacturers of this material.

The radiological safety assessment included radiological surveys using portable radiation detection survey instruments, in addition to specific isotopic radioactive analysis at an accredited radiological laboratory (APPENDICES A and B).

A total of 60 swipe samples and 63 instrument measurements were taken for a total of 123 radiological measurements.

In addition, this report reflects the current U.S. Nuclear Regulatory Commission (NRC) Standards, Regulations and Present Guidance as it relates to the release of Facilities for Unrestricted Use or Termination of Licenses for Byproduct, Source or Special Nuclear Material.

> • Guidelines for Decontamination of Facilities and Equipment Prior to Release for By Product, Source or Special Nuclear Material. U.S. Nuclear Regulatory Commission (NRC), August, 1993. (APPENDIX C).

EXECUTIVE SUMMARY AND ACTION ITEMS (continued)

The findings and results of all samples (instrument and swipe surveys) indicated that the FAA printing plant facility, loading dock, trash compactor and storage closet Room B-911 were free of fixed and removable contamination and qualify for "Unrestricted Use" as specified by the Nuclear Commission (NRC) regulations, standards and guidelines.

The results of the Radiological Health Safety Assessment indicate that radiation exposures to personnel are well below the guidelines, recommendations, and radiation standards of currently accepted various state, local, federal and national regulatory agencies and therefore do not pose or represent any health hazard or health risk at this time (APPENDICES F and G).

II. INTRODUCTION

This radiological health and safety assessment was requested by Mr. Terry M. Laydon, Safety and Environmental Manager of the FAA. The date of the request was March 2, 2006. The Radiological Assessment was performed by Michael S. Terpilak, Certified Health Physicist (CHP), and Kiel W. Fisher, Industrial Hygienist Technician of PHS/DFOH on February 22, 24, and 28, 2006.

The objective of the radiological health and safety assessment was to perform a radiological survey for fixed and removable contamination, using portable radiation detection survey instruments and specific isotopic laboratory analyses to assess any radiological impact on the individual workers, personnel and/or printing plant facilities of the FAA at this specific location.

The objective of this report is to present the findings and results of this radiation survey and to indicate whether the facilities surveyed qualify for release for Unrestricted Use in accordance with current U.S. NRC guidelines, regulations, and standards.

III. BACKGROUND

- The National Oceanic and Atmospheric Administration (NOAA) operated a printing plant located in the basement of the Herbert C. Hoover Building (HCHB).
- The operation was transferred to Federal Aviation Administration (FAA) in 2000.
- The FAA printing operation is in the process of moving out of the HCHB.
- The FAA Print Shop, located in the basement of the HCHB, placed a package containing two metal bars, i.e., static eliminators, into the trash and compacted the bars. (Attachment A, Figures 1, 2, 3, 4 and 5).
- The bars were used in the printing process to limit static electricity and dust from the photo machine.
- The trash load was sent to the Mostoller Landfill in Pennsylvania.
- Radiation sensors at the landfill detected radioactive material in the truck on its way in.
- The Pennsylvania Department of Environmental Quality and the Nuclear Regulatory Commission (NRC) were contacted and investigated.
- Radiation source was the two static eliminator metal bars from HCHB.
- The bars were in boxes that appeared to be original packing materials.

- Boxes were labeled for Americium-241.
- The original mailing label identified the receiver as the National Oceanic and Atmospheric Administration (NOAA).
- One box and the bar inside were damaged.
- This damage indicated radioactive particles may have been released.
- Sampling showed results of 0.0037 microcuries.
- The recognized safe limit defined by NRC is below 0.005 microcuries.

IV. EVALUATION METHODS

The radiological health and safety assessment was conducted by Michael S. Terpilak, Certified Health Physicist (CHP) and Kiel W. Fisher, Industrial Hygienist Technician of PHS/DFOH in a manner consistent with and similar to typical radiation surveys of licenses by the Nuclear Regulatory Commission (NRC).

In addition, the following radiological surveys were conducted prior to the release of Facilities for unrestricted use.

- Establishing Background Levels
- Scanning Survey Using Portable Radiation Instruments
- Fixed and removable Surface Contamination Measurements
- Laboratory Analysis and Measurement of Smear (Filter Paper) Samples

ESTABLISHING BACKGROUND LEVELS

Background was determined by conducting survey measurements and/or sampling at locations on the site, which are unaffected by-site operations, i.e., preferable locations for interior background determinations all within on-site buildings of similar construction, or even locations that has had no previous history of licensed operations, i.e., use of radioactive materials. Surveys conducted with portable radiation instruments as well as smear surveys were duplicated in office space similar in dimensions and construction that are presently using licensed materials. Background surveys radiation instrument surveys were in the range of 0.01 mR/hr to 0.020 mR/hr, i.e., 10-20 μ R/hr and random smear samples were nondetectable, i.e., Minimum Detectable Activity (MDA).

SCANNING SURVEYS USING PORTABLE RADIATION INSTRUMENTS

These measurements typically consist of surface scanning (moving the detector at a consistent speed and distance near the surface) and measuring levels of direct radiation (surface activity and exposure rate) at representative points.

4

Before conducting any fixed measurements, surfaces are scanned to identify the presence of elevated direct radiation which might indicate residual gross activity or hot-spots. Scans are conducted for all radiations potentially present, based on the operational history. The scanning detector is kept as close as possible to the surface and moved across the surface at a slow speed. Nominally, the distance between the detector and the surface is maintained at less than two centimeters. For particulate radiations (beta) which may have very limited ranges, the scan speed should not exceed 1 detector width per second; this speed should be reduced to as low as 1/3 detector width per second for those situations when relatively low count rates may be indicative of residual activity exceeding guideline values. For gamma radiation the scanning speed may be greater; the probe is typically moved in a serpentine pattern while advancing at a speed of about 0.5 m per second.

Gamma Field Survey Instrumentation

The following instrument was utilized in the survey.

• FAG Model #FH4046 serial #1202, halogen quenched Geiger-Muller (G-M) instrument, which also reads out in the microroentgens/hour (μR/hr). This is a German manufactured instrument.

The appropriate calibration certificates for the above instrument are enclosed (APPENDIX D).

A complete radiological assessment included a radiation survey utilizing Radiological Instrumentation as identified and specified in **APPENDIX A**.

V. STATIC ELIMINATORS USED BY THE FEDERAL AVIATION ADMINISTRATION.

Manufacturer Information

The manufacturer of the two bars found at the landfill is NRD, LLC of New York.

NRD, LLC sold nine bars to NOAA in June 1981.

In an attempt to locate the remaining seven bars, on February 17, 2006 the FAA conducted a search of the print area.

- Found a total of seven bars in a storage room in the print area.

- Search also revealed no other bars in the print area.

Data on the 7 Bars Found

- NRD Model 2003 ISOTOPE Am-241
 - Serial Number: SA 2199
 - 25.87 MIC
 - 6/81
 - 57 inches long
- 3M Static Eliminator
 - Model 210
 - Serial Number B00860
 - --- 14 Sep 79
 - --- Po-210 96 mc
 - 48 inches long
- 3M Static Eliminator
 - Model 210
 - -- Serial Number B00861
 - 14 Sep 79
 - Po-210 96 mc
 - 48 inches long
- 3M Static Eliminator
 - Model 210
 - Serial Number B00862
 - 14 Sep 79
 - Po-210 <u>96</u> mc
 - 48 inches long

One Americium-241 NRD static eliminator bar Serial #SA 1299 was found in the storage closet Room B-911 and was surveyed on Wednesday, February 23, 2006 and the laboratory analysis indicated it was leaking, i.e., contaminated to the level of 800 disintegrations per minute per 100 centimeters square (800 <u>DPM</u>).

$100 \mathrm{cm}^2$

The contaminated Americium-241 static eliminator was double bagged with polyethylene and secured with masking tape. The storage closet Room B-911 was locked, secured and posted with a Radioactive Materials sign.

On Monday February 27, 2006 a complete and thorough radiation instrument and swipe survey was conducted. A total of 37 radiation instrument surveys were taken and a total of 35 swipes were also taken. The swipe samples were delivered to the Radiological Laboratory in Columbia, Maryland.

- 3M Static Eliminator

 - --Po-210 <u>96</u> mc
 - -18 inches long

The six Polonium-210 static eliminators with a radioactive half-life of 138 days have decayed, i.e., the bars have gone through a total of 10 half-lives or 1380 days or 3.8 years.

These static eliminators were purchased from the 3M Company on September 14, 1978 and September 14, 1979 and have been stored by the agency for a period of 26.5 and 27.5 years.

Characteristics of typical static eliminators used by the FAA, printing plant is attached as **APPENDIX E**.

SUMMARY

A current summary of the Static Eliminator bar inventory is presented below:

#	DESCRIPTION	SERIAL #	LOCATION
1	NRD Americium-241 Static Eliminator	SA2200	Transferred to NRD
2	NRD Americium-241 Static Eliminator	SA2202	Transferred to NRD
1	NRD Americium-241 Static Eliminator	SA2201	Storage Closet B911
2	NRD Americium-241 Static Eliminator	SA2199	Storage Closet B911
3	3M Polonium-210 Static Eliminator	3M-B00-860	Storage Closet B911
4	3M Polonium-210 Static Eliminator	3M-B00-861	Storage Closet B911
5	3M Polonium-210 Static Eliminator	3M-B00-862	Storage Closet B911
6	3M Polonium-210 Static Eliminator	3M-B00-863	Storage Closet B911
7	3M Polonium-210 Static Eliminator	3M-B00-864	Storage Closet B911
8	3M Polonium-210 Static Eliminator	3M-B00-865	Storage Closet B911
1	NRD Americium-241 Static Eliminator	SA2203	To be determined
2	NRD Americium-241 Static Eliminator	SA2204	To be determined
3	NRD Americium-241 Static Eliminator	SA2205	To be determined
4	NRD Americium-241 Static Eliminator	SA2206	To be determined
5	NRD Americium-241 Static Eliminator	SA2207	To be determined

7

VI. RADIATION SURVEYS

The radiation surveys conducted by portable radiation detection instruments in the FAA facilities did not indicate any fixed contamination on the surface areas surveyed. A total of 63 surfaces, areas and locations were surveyed in the HCHB and all instrument surveys indicated no radiation levels above natural background. [Therefore, an indication of no fixed contamination was identified.]

As a result of these instrument surveys since there was no fixed contamination identified, there was no need to express results in fixed contamination in $dpm/100 \text{ cm}^2$. The specific radionuclides in question have energies similar to the calibration energies of the radiation instruments used for the surveys.

In addition, all 59 swipe surveys in the HCHB were determined to be Minimum Detectable Activity (MDA), i.e., zero Disintegrations per Minute (DPM) which indicates that there was no removable and/or loose surface contamination identified, except for one swipe number #5, the exposed section of the NRD static eliminator Serial # SA 1299 which was bagged with polyethylene and secured with masking tape.

REMOVABLE SURFACE CONTAMINATION MEASUREMENTS

A total of 60 swipe area measurements were conducted in the laboratory.

Swipe samples were conducted over a surface of 100 cm^2 .

The 60 swipe samples were analyzed for the following:

• Gross Alpha – Gas filled proportional counter.

LABORATORY ANALYSIS AND MEASUREMENT OF SMEAR (FILTER PAPER) SAMPLES

If any samples were identified with radioactive contamination, then these samples were analyzed for specific radioactivity, i.e., isotopic analysis. The results of the swipe sample analysis are enclosed. (APPENDIX B).

A total of 60 swipe surveys were taken; in addition 63 instrument surveys readings were measured. The external dose rates were reported in units of microroentgen per hour (μ R/hour) and the levels of radioactive materials, including alpha were reported in DPM/100 cm² for removable and fixed contamination for surfaces.

VII. ANALYSIS AND COMPARISON OF RADIATION SURVEY RESULTS TO U.S. NUCLEAR REGULATORY COMMISSION (NRC) GUIDELINES

The USNRC guidance document entitled "Guidelines for Decontamination of Facilities and Equipment Prior to Release for Unrestricted Use or Termination of Licenses for Byproduct, Source or Special Nuclear Material," April 1993 states that depending on the specific radionuclides identified, acceptable surface contamination levels shall be followed.

The alpha emitter nuclide category for acceptable surface contamination levels are as follows:

- Average 100 dpm $\alpha/100$ cm²
- Maximum 300 dpm $\alpha/100$ cm²
- Removable 20 dpm $\alpha/100$ cm²

The Beta-Gamma emitter nuclide category for acceptable surface contamination levels are as follows:

- Average 5,000 dpm $B\gamma/100 \text{ cm}^2$
- Maximum 15,000 dpm By/100 cm²
- Removable 1,000 dpm $B\gamma/100 \text{ cm}^2$

In addition, the average and maximum radiation levels associated with surface contamination resulting from beta-gamma emitters should not exceed 0.2 mrad/hr at 1 cm and 1.0 mrad/hr at 1 cm respectively, measured through not more than 7 milligrams per square centimeter of total absorber.

Swipe surveys in all the facilities of HCHB indicated that samples were nondetectable, i.e., Minimum Detectable Activity (MDA), the results were significantly below the average, maximum and removable acceptable surface contamination levels.

In addition, to be consistent and compliance with 10 CFR Part 10, Subpart E -Radiological Criteria for License Termination, i.e.,

§20.1402 Radiological criteria for unrestricted use. A site will be considered acceptable for unrestricted use if the residual radioactivity that is distinguishable from background radiation results in a TEDE to an average member of the critical group that does not exceed 25 mrem (0.25 mSv) per year including that from groundwater sources of drinking water, and that the residual radioactivity has been reduced to levels that are as low as reasonably achievable (ALARA). Determination of the levels which are (ALARA).

The following calculations indicate that dose assessment from the specific radionuclide was made and is discussed below.

Subsequently the radiation instrument surveys of various locations in the HCHB indicated levels in the range of 0.010 mR/hr and 0.020 mR/hr, i.e., 10-20 μ R/hr which indicate natural background radiation and were significantly below the average and maximum radiation levels associated with surface contamination.

VIII. BRIEF SUMMARY OF STANDARDS AND CRITERIA

The U.S. Nuclear Regulatory Commission (NRC), Division of Fuel Cycle, Medical, Academic and Commercial Use Safety, Washington, D.C., has published a technical document entitled "Guidelines for Decontamination of Facilities and Equipment Prior to Release for Unrestricted Use or Termination of Licenses for Byproduct, Source of Special Nuclear Material," dated April 1993. The document delineates specific instructions concerning instrument and swipe surveys and Table 1, specifically states "Acceptable Surface Contamination Levels" that shall be used for decontamination of facilities and equipment prior to release for unrestricted use (Appendix C).

A total dose and health risk assessment for the specific radionuclide Americium-241 was made and is discussed in **APPENDIX F**.

IX. RESULTS AND CONCLUSIONS

Based on the results of the radiological health and safety assessment at the Herbert C. Hoover Building, the areas and the rooms identified in this report can be released for unrestricted use.

The results of the Radiological Health Safety Assessment indicate that radiation exposures to personnel are well below the guidelines, recommendations, and radiation standards of currently accepted various state, local, federal and national regulatory agencies and therefore do not pose or represent any health hazard or health risk at this time (APPENDICES F and G).

X. RECOMMENDATIONS

Conduct a due diligence inventory and accountability report for the five missing NRD Americium-241 Static Eliminators and provide the report to the Nuclear Regulatory Commission (NRC), Region 1, King of Prussia, Pennsylvania.

GLOSSARY

GLOSSARY	
Absorbed Dose	The amount of ionizing radiation energy imparted to matter per unit mass of irradiated matter.
Activity	The number of nuclear transformations occurring in a given quantity of radioactive material per unit time, which is a measurement of the source amount.
Alpha Particle	A strongly ionizing particle emitted from the nucleus of an atom during radioactive decay, containing 2 protons and neutrons and having a double positive charge.
Authorized User	An individual who, having satisfied the applicable training and experience requirements, is granted the authority to order radioactive material and accepts responsibility for its safe receipt, storage, use, transfer and disposal.
Beta Particle	An ionizing charged particle emitted from the nucleus of an atom during radioactive decay, equal in mass and charge to an electron.
Bioassay	A determination of the quantity of radioactive material in the human body, either by direct measurement (in vivo counting) or by analysis of excreta.
Biological Half-Life	The length of time required for one-half of a radioactive substance to be biologically eliminated from the body.
Brachytherapy	A treatment with ionizing radiation where the radioactive source is applied to the surface of the body or is located a short distance from the body area being treated.
Bremsstrahlung	Electromagnetic (x-ray) radiation associated with the deceleration of charged particles passing through matter.
Byproduct material	A certain class of radioactive material regulated by the Nuclear Regulatory Commission.
Contamination	The deposition of radioactive material in any place where it is not wanted.
Counts per Minute (cpm)	The number of nuclear transformations from radioactive decay able to be detected by a counting instrument in a one minute time interval.
Curie	A unit of activity, equal to 37 billion disintegrations per second.

33 . 4⁴

Custodian	An individual who is granted the authority over and accepts responsibility for the safe use of a sealed source or radiation-producing device.
Declared Pregnant Woman	A woman who has voluntarily informed her employer, in writing, of her pregnancy and the estimated date of conception, thereby applying a dose limitation to the fetus.
Disintegrations per Minute (dpm)	The number of nuclear transformations from radioactive decay in a one minute time interval.
Dose Equivalent	A quantity of radiation dose expressing all radiation on a common scale for calculating the effective absorbed dose.
Dosimeter	A device used to determine the external radiation dose a person has received.
Effective Half-Life	The length of time required for a radioactive substance in the body to lose one-half of its activity through a combination of biological elimination and radioactive decay.
Exposure	The amount of ionization in air from x-rays or gamma rays.
Film Badge	A dosimeter worn by radiation workers to measure their radiation dose. The badge contains a piece of film that is darkened by radiation, and may contain filters which shield parts of the film from certain types of radiation.
Gamma rays	A very penetrating electromagnetic radiation emitted from a nucleus of an atom during radioactive decay.
Half-Life	The length of time required for a radioactive substance to lose one- half of its activity by radioactive decay.
Health Physicist	A trained specialist in the field of radiation protection.
Individual User	An individual who, having satisfied the applicable training requirements, is granted permission to work with radioactive material under the supervision of an Authorized User.
Isotope	A particular nuclide of an element.
Neutron	An ionizing particle emitted from a nucleus of an atom during radioactive decay, similar in mass to a hydrogen atom and having a charge of zero.

. р с1

کې د د

5	
Photon	A type of radiation in the form of an electromagnetic wave, having zero mass and zero charge.
Positron	An ionizing charged particle emitted from a nucleus of an atom during radioactive decay, equal in mass to an electron and having a charge of +1.
Protocol	A written, detailed experimental design, reviewed and approved by the Radiation Safety Branch, for the use of radioactive materials in excess of set limits or the use of volatile radioiodines outside of Building 21.
Rad	A unit of radiation absorbed dose. One rad is equal to 100 ergs per gram,
	An emission of energy in the form of photons (gamma, x-rays) or particles (alpha, beta, positron, neutron radiation).
	The spontaneous process of unstable nuclei in an atom disintegrating into stable nuclei, releasing radiation in the process.
	A nuclide with an unstable ratio of neutrons to protons, which will cause it to undergo radioactive decay.
	A unit of radiation dose equivalent. One rem is equal to one rad of beta, gamma, or x-ray radiation, or 1/20 rad of alpha radiation.
	A unit of radiation exposure. One Roentgen is equal to 0.00025 Coulombs of electrical charge per kilogram of air.
	A source of radioactive material that is sealed in a capsule designed to prevent leakage or escape of the material.
luminescent Dosimeter	A dosimeter worn by radiation workers to measure their radiation dose. The TLD contains a crystalline material which stores a fraction of the absorbed ionizing radiation and releases this energy in the form of light photons when heated.
Total Effective Dose Equivalent	The sum of an internal radiation dose and external radiation dose received by an individual.
	A penetrating type of photon radiation emitted from outside the nucleus of a target atom during bombardment of a metal with fast

RADIOLOGICAL ASSESSMENT

RADIATION DETECTION INSTRUMENT SURVEY

OF THE

FEDERAL AVIATION ADMINISTRATION

FACILITIES

WASHINGTON, D.C.

FEBRUARY 22, 27, AND MARCH 8, 2006.

Phase 1 Americum-241 Sampling Project Radiation Instrument Measurement Locations and Results 02/22/06

INSTRUMENT	INSTRUMENT			
MEASUREMENT #	MEASUREMENT	SAMPLE LOCATION DESCRIPTION	SERIAL NUMBER	MANUFACTURER
1 .]	20 µR/hr	Hallway near elevators - 1st Floor	N/A	N/A
2	14 µR/hr	Inside the Elevator	N/A	N/A
3	15 µR/hr	Floor outside Elevator - Basement Floor	N/A	N/A
4	12 µR/hr	Loading Dock	N/A	N/A
5	10 µR/hr	Below Loading Dock - Ground Level	N/A	N/A
6	12 µR/hr AVG.	Room # B210 Near Entrance	N/A	N/A
7	12 µR/hr AVG.	Room # B210 Middle of Room	N/A	N/A
		Room # B911 Storage Closet		
8	5.0 mR/hr	Americium-241 Bar - Bar Casing - NRD	SA2199	NRD
9	5.0 mR/hr	Americium-241 Bar - Bar Itself - NRD	SA2199	NRD
10	16-18µR/hr	Polonium-210 Bar 48" - Bar Itself -3M	B00862	3M
11	14-16µR/hr	Polonium-210 Bar 60" - Bar Itself -3M	B00863	3M
12	55-70µR/hr	Polonium-210 Bar 48" - Bar Itself -3M	B00860	3M
13	16-18µR/hr	Polonium-210 Bar 48" - Bar Itself -3M	B00861	3M
14	14-16µR/hr	Polonium-210 Bar 18" - Bar Itself -3M	B00865	3M
15	16-19µR/hr	Polonium-210 Bar 100" - Bar Itself -3M	B00864	3M
		Path From Room #B204 to Trash Compactor		
16	10 µR/hr	Hallway Outside Room # B204	N/A	N/A
17	12 µR/hr	Hallway Outside Room # B211A	N/A	· N/A
18	13 µR/hr	Hallway Outside Room # B213	N/A	N/A
19	14 µR/hr	Entrance to Loading Dock	N/A	N/A
20	13 µR/hr	Entrance to Loading Dock Near Bike Port	N/A	N/A
21	13-15 µR/hr	Loading Dock	N/A	N/A
22	13-15 µR/hr	Loading Dock	N/A	N/A
23	13-15 µR/hr	Loading Dock	N/A	N/A
24	13-15 µR/hr	Loading Dock	N/A	N/A
25	18-19 µR/hr	Inside Trash Compactor - Left Side	N/A	N/A
26	14-16 µR/hr	Inside Trash Compactor - Front Side	N/A	N/A
27	11-12 µR/hr	Inside Trash Compactor - Right Side	N/A	N/A
28	8-9 µR/hr	Inside Trash Compactor - Middle Floor	N/A	N/A

* Background Radiation - 10µR/hr - 20µR/hr in Herbert C. Hoover Building

Phase 2 Radilogical Health Assessment Project Radiation Instrument Measurement Locations and Results Room #B911 02-27-06

INSTRUMENT MEASUREMENT #	INSTRUMENT MEASUREMENT	SAMPLE LOCATION DESCRIPTION		
Background	10.0µR/hr	Background reading taken outside of the storage closet		
25	14.5µR/hr	Outside entrance door knob		
. 26	14.9µR/hr	Inside entrance door knob		
27	17.8µR/hr	Floor of entrance - below door		
28	19.6µR/hr	Light switch near entrance		
29	26.0µR/hr	Floor - middle of room b/t entrance and Kenmore® freezer		
30	26.1µR/hr	Kenmore® freezer door handle		
. 31	22.2µR/hr	Kenmore® freezer door shelves		
32	25.9µR/hr	Kenmore® freezer main compartment		
33	25.0µR/hr	Whirlpool® refrigerator door handle		
34	22.2µR/hr	Whirlpool® refrigerator door shelves		
35	22.5µR/hr	Whirlpool® refrigerator door main compartment		
.36	19.6µR/hr	Coldspot® refrigerator door handle		
37	18.7µR/hr	Coldspot® refrigerator door shelves		
38	16.5µR/hr	Coldspot® refrigerator door main compartment		
39	19.5µR/hr	Floor - middle of room b/t Coldspot® refrigerator and box pile #2		
40	23.2µR/hr	Floor - middle of room b/t support beam and locker #2		
41	19.9µR/hr	Support beam - concrete wall face of support beam		
42	20.2µR/hr	Concrete - behind support beam		
43	17.7µR/hr	Support beam - room face of support beam		
44	15.7µR/hr	Box pile #1		
45	15.5µR/hr	Door handles on locker #1		
46	14.9µR/hr	Inside locker #1		
. 47	12.9µR/hr	Floor - b/t locker #5/6 and #3/4		
	15.2µR/hr	Door handles on locker #6		
49	18.4µR/hr	Inside locker #6		
50	16.2µR/hr	Door handles locker #3		
51	20.5µR/hr	Inside locker #3		
52	29.9µR/hr	Door handles locker #4		

Radilogical Health Assessment Project Radiation Instrument Measurement Locations and Results Room #B911 02-27-06

53	25.0µR/hr	Inside locker #4	
54	51.2µR/hr	On top of locker #4	
55	19.5µR/hr	Door handle locker #2	
56	19.7µR/hr	Inside locker #2	
57	15.0µR/hr	Box pile #2	
58	16.1µR/hr	Floor - b/t box pile #2 and entrance	
59	23.0µR/hr	Wall - next to locker #4	
Avg. Concrete	26 - 32µR/hr	Average of all concrete walls	

* Background Radiation - 10µR/hr - 20µR/hr in HCHB.

Phase 4 NACO Printing Plant Maintenance Shop Radiation Sampling Project Radiation Instrument Measurement Locations and Results

03/08/06

INSTRUMENT	INSTRUMENT			
MEASUREMENT #	MEASUREMENT	SAMPLE LOCATION DESCRIPTION	SERIAL NUMBER	MANUFACTURER
1	10.0 µR/ hr	Hallway - Room B220	N/A	N/A
2	10.5 µR/ hr	Push cart - Room B220	N/A	N/A
3	10.7 µR/ hr	Middle of floor - Room B220	N/A	N/A
4	16.2 µR/ hr	Shelves - Room B220	N/A	N/A
5	16.8 µR/ hr	Entrance - Room B222A	N/A	N/A
6	19.8 µR/ hr	Ceiling Shelf - Room B222A	N/A	N/A
7	18.5 µR/ hr	AVG - Room B222A	N/A	N/A
8	17.4 µR/ hr	Ceiling Shelf - Room B222A	N/A	N/A
9	15.5 µR/ hr	Entrance floor - Room B224	N/A	N/A
10	16.1 µR/ hr	Desk - Room B224	N/A	N/A
11	13.1 µR/ hr	Entrance floor near hallway - Room B224	N/A	N/A
12	12.8 µR/ hr	Desk on hallway wall - Room B224	N/A	N/A
13	13.2 µR/ hr	Entrance from Room B224A	N/A	N/A
14	15.6 µR/ hr	Desk in middle of floor - Room B224	· N/A	N/A
15	11.2 µR/ hr	Shop floor - Room B200A	N/A	N/A
16	17.5 µR/ hr	Desk in shop - Room B220A	N/A	N/A
17	14.5 µR/ hr	Work Bench in Shop - Room B220A	N/A	N/A
18	15.4 µR/ hr	Work Bench in Shop - Room B220A	N/A	N/A
19	13.7 µR/ hr	Work Bench in Shop - Room B220A	N/A	N/A
20	13.5 µR/ hr	Work Bench in Shop - Room B220A	N/A	N/A
21	14.2 µR/ hr	Middle of shop floor - Room B220A	N/A	N/A
22	19.2 µR/ hr	Shop side entrance - Room B220A	N/A	N/A
23	22.2 µR/ hr	Shop front entrance - Room B220A	N/A	N/A
24	3.28 mR/hr	Label side of bar - 1st 1/4 of bar in Room B911 - Am241	A2201	NUCLESTAT
25	6.09 mR/hr	2nd 1/4 of bar in Room B911 - Am241	A2201	NUCLESTAT
26	7.05 mR/hr	3rd 1/4 of bar in Room B911 - Am241	A2201	NUCLESTAT
27	7.32 mR/hr	Side opposite label of bar - 4th 1/4 of bar in Room B911 - Am241	A2201	NUCLESTAT

* Background Radiation - 10µR/hr - 20µR/hr in Herbert C. Hoover Building

APPENDIX C

GUIDELINES FOR DECONTAMINATION OF FACILITIES AND EQUIPMENT PRIOR TO RELEASE FOR UNRESTRICTED USE OR

TERMINATION OF LICENSES FOR BYPRODUCT, SOURCE, OR SPECIAL NUCLEAR MATERIAL

U.S. Nuclear Regulatory Commission

Division of Fuel Cycle, Medical, Academic, and Commercial Use Safety

Washington, DC 20555

April 1993

GUIDELINES FOR DECONTAMINATION OF FACILITIES AND EQUIPMENT PRIOR TO RELEASE FOR UNRESTRICTED USE

OR TERMINATION OF LICENSES FOR BYPRODUCT, SOURCE,

OR SPECIAL NUCLEAR MATERIAL

U.S. Nuclear Regulatory Commission Division of Fuel Cycle, Medical, Academic, and Commercial Use Safery Washington, DC 20555

April 1993

C-1

The instructions in this guide, in conjunction with Table 1, specify the radionuclides and radiation exposure rate limits which should be used in decontamination and survey of surfaces or premises and equipment prior to abandonment or release for unrestricted use. The limits in Table 1 do not apply to premises, equipment, or scrap containing induced radioactivity for which the radiological considerations pertinent to their use may be different. The release of such facilities or items from regulatory control is considered on a case-by-case basis.

1. The licensee shall make a reasonable effort to eliminate residual contamination.

2. Radioactivity on equipment or surfaces shall not be covered by paint, plating, or other covering material unless contamination levels, as determined by a survey and documented, are below the limits specified in Table 1 prior to the application of the covering. A reasonable effort must be made to minimize the contamination prior to use of any covering.

3. The radioactivity on the interior surfaces of pipes, drain lines, or ductwork shall be determined by making measurements at all traps, and other appropriate access points, provided that contamination at these locations is likely to be representative of contamination on the interior of the pipes, drain lines, or ductwork. Surfaces of premises, equipment, or scrap which are likely to be contaminated but are of such size, construction, or location as to make the surface inaccessible for purposes of measurement shall be presumed to be contaminated in excess of the limits.

Upon request, the Commission may authorize a licensee to relinquish possession or control of premises, equipment, or scrap having surfaces contaminated with materials in excess of the limits specified. This may include, but would not be limited to, special circumstances such as razing of buildings, transfer of premises to another organization continuing work with radioactive materials, or conversion of facilities to a long-term storage or standby status. Such requests must:

4.

- a. Provide detailed, specific information describing the premises, equipment or scrap, radioactive contaminants, and the nature, extent and degree of residual surface contamination.
- b. Provide a detailed health and safety analysis which reflects that the residual amounts of materials on surface areas, together with other considerations such as prospective use of the premises, equipment, or scrap, are unlikely to result in an unreasonable risk to the health and safety of the public.

Prior to release of premises for unrestricted use, the licensee shall make a comprehensive radiation survey which establishes that contamination is within the limits specified in Table 1. A copy of the survey report shall be filed with the Division of Fuel Cycle Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington, D.C. 20555, and also the Administrator of the NRC Regional Office having jurisdiction. The reports should be filed at least 30 days prior to the planned date of abandonment. The survey report shall:

a. Identify the premises.

5.

b. Show that reasonable effort has been made to eliminate residual contamination.

c. Describe the scope of the survey and general procedures followed.

d. State the findings of the survey in units specified in the instructions.

Following review of the report, the NRC will consider visiting the facilities to confirm the survey.

2

\BLE I

ACCEPTABLE SURFACE CONTAMINATION LEVELS

NUCLIDES'	AVERAGE	MAXIMUM ^{bdr}	REMOVABLEbef
U-nat, U-235, U-238, and associated decay products	5,000 dpm α/100 cm ²	15,000 dpm $\alpha/100$ cm ²	1,000 dpm α/100 cm ²
Transurancies, Ra-226, Ra-228, Th-230, Th-228, Pa-231, Ac-227, I-125, I-129	100 dpm/100 cm²	300 dpm/100 cm ²	20 dpm/100 cm ²
Th-nat, Th-232, Sr-90, Ra-223, Ra-224, U-232, I-126, I-131, I-133	1,000 dpm/100 cm ²	3,000 dpm/100 cm²	200 dpm/100 cm ²
Beta-gamma emitters (nuclides with decay modes other than alpha emission or spontaneous fission) except Sr-90 and other noted above.	5,000 dpm βΥ/100 cm²	15,000 dpm βΥ/100 cm²	1,000 dpm βΥ/100 cm²

* Where surface contamination by both alpha- and beta-gamma-emitting nuclides exists, the limits established for alpha- and beta-gamma-emitting nuclides should apply independently.

- ^b As used in this table, dpm (disintegrations per minute) means the rate of emission by radioactive material as determined by correcting the counts per minute observed by an appropriate detector for background, efficiency, and geometric factors associated with the instrumentation.
- ⁶ Measurements of average contaminant should not be averaged over more than 1 square meter. For objects of less surface area, the average should be derived for each such object.
- ^d The maximum contamination level applies to an area of not more than 100 cm².
- ^e The amount of removable radioactive material per 100 cm² of surface area should be determined by wiping that area with dry filter or soft absorbent paper, applying moderate pressure, and assessing the amount of radioactive material on the wipe with an appropriate instrument of known efficiency. When removable contamination on objects of less surface area is determined, the pertinent levels should be reduced proportionally and the entire surface should be wiped.
- ¹ The average and maximum radiation levels associated with surface contamination resulting from beta-gamma emitters should not exceed 0.2 mrad/hr at 1 cm and 2.0 mrad/hr at 1 cm, respectively, measured through not more than 7 milligrams per square centimeter of total absorber.

TOTAL DOSE ASSESSMENT

CALCULATIONS

ON SPECIFIC RADIONUCLIDE .

AMERICIUM-241

USED AT THE

FEDERAL AVIATION ADMINISTRATION

PRINTING PLANT

WASHINGTON, D.C.

TOTAL DOSE ASSESSMENT

Since all results of radiation surveys swipes and instrument measurements indicate no removable, residual or fixed radioactivity on all surfaces, floor, walls, doors, etc., in addition to all instrument surveys indicating no measurements above natural background, the HCHB meets all the criteria for unrestricted use.

Using NUREG-1500, the following assumptions have been made.

If the storage closet Room B-911 average surface contamination from Americium-241 was 800 DPM/100 cm², the dose associated with the building occupancy scenario would be as follows: using Table A-2 Building Occupancy ScenarioDose in First Year following unrestricted use based on 800 DPM/100 cm² initial activity.

Activity	·	External Dose	Total	
of		1 mrem/year	External Dose	
<u>Americium-241</u>		<u>Americium-241</u>	<u>mrem/year</u>	
$\frac{800 \text{ DPM}^{*}}{100 \text{ cm}^{2}}$	X	3.29x10 ⁻²	-	0.026

If we now compare this external dose to that that an individual member of the general public receives from natural background radiation which is approximately 295 mrem/year and the combined annual dose from natural background radiation and manmade radiation is approximately 360 millirem/year, then the 0.026 mrem/year exposure from the Americium-241 is approximately 4-5 orders of magnitude lower than the annual total natural background and man-made radiation to the average individual in the United States (APPENDIX F).

This dose rate is then in full compliance with 1- CFR Part 20 Subpart E — Section 20.1402 Radiological Criteria for Unrestricted Use which states that the Total Effective Dose Equipment (TEDE) to an average member of the critical group does not exceed 25 mrem (0.25 mSV) per year above national background radiation.

The 800 <u>DPM</u> is calculated to be 0.00176 microcuries (μ Ci). The recognized safe limit 100 cm²

Defined by the NRC is below 0.005 microcuries (μ Ci) on such leak testing.

ATTACHMENT A

- LOCATION OF BARS
- LOCATION OF TWO BARS SENT TO LANDFILL
- TRASH COMPACTOR
- AMERICUM-241 BAR TYPE 1
- AMERICUM-241 BAR TYPE 2

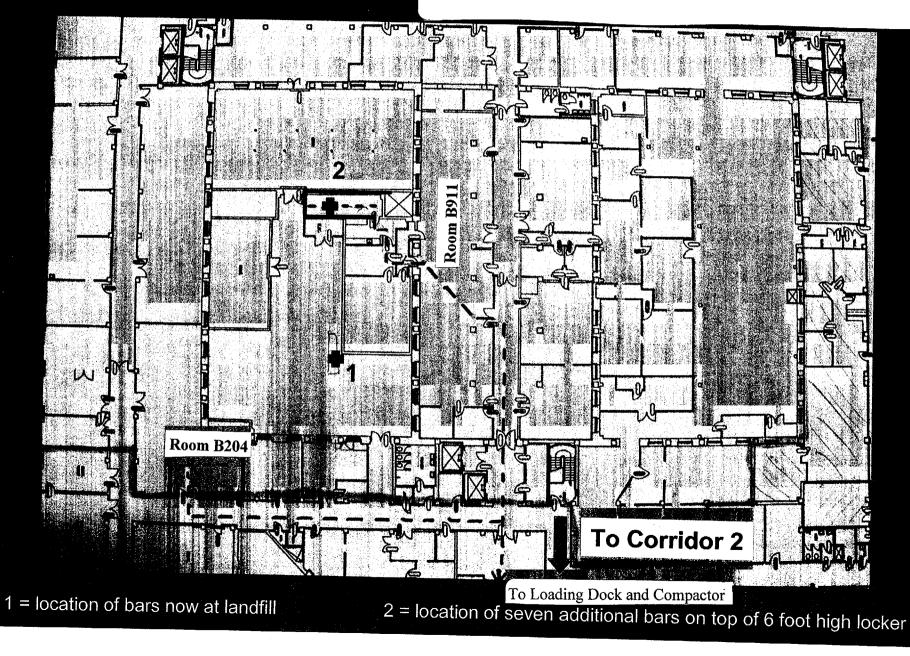

• CORRESPONDENCE FOR DISPOSAL OF TWO NRD AMERICAM-241 STATIC ELIMINATOR BARS

MARCH 10, 2006

Location of Bars

Solid black lines designate location of storage rooms,

Dotted black lines designate swipe surveys and removal of static eliminator bars to loading dock and trash compactor.

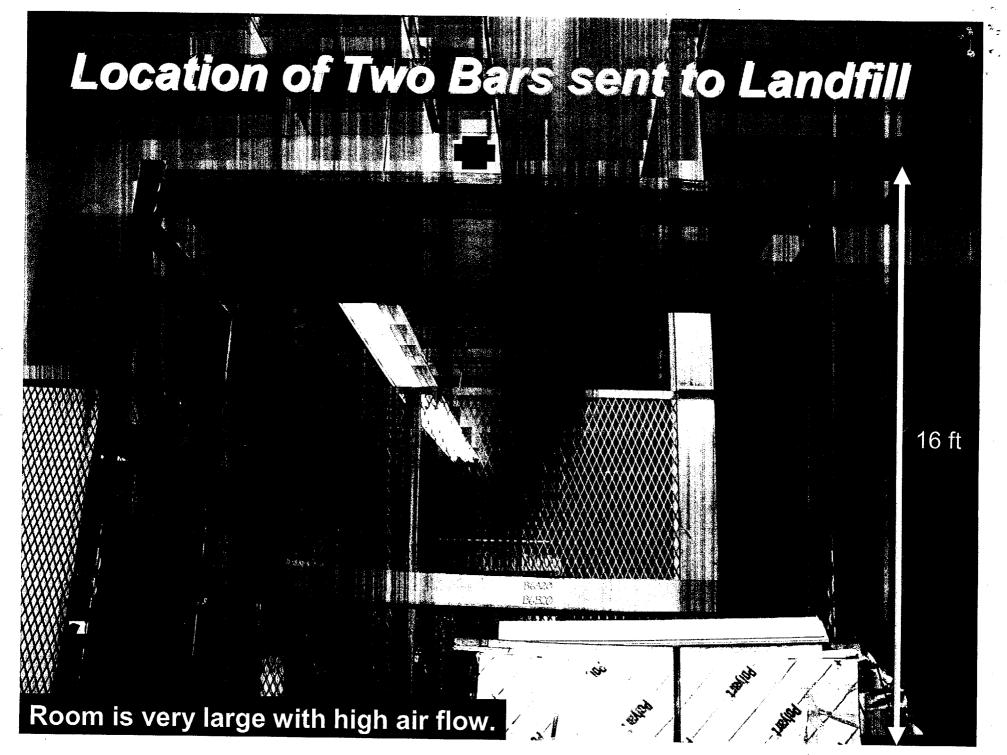

Figure 2

Strong steel container where bars was probably damaged. Release of radiation to outside highly unlikely.
