Dave,

Attached is the technical contact for the braidwood issue.

Thanks for the support!!!!
Rick

Mel,

DRP has asked for some limited support with respect to the Braidwood tritium issue. Basically, the licensee is going to try to show that there is no current ongoing release (break in the pipe) by some type of accoustical monitoring technique. [REDACTED]

[REDACTED] They have requested that one of our NDE folks call the licensee contact indicated in the attached and question them regarding this technique. They would like some feedback on our views on whether this technique is sufficient to show no pipe leakage. Could you handle this for us? After you talk to them, let me know what you think as well.

- Thanks

Rick, the licensee contact for the acoustical monitoring of the pipe is Jerry Panfield. He can be reached at 815-417-3384. My understanding, is that they will begin the monitoring Monday of next week, take a break for the holidays, and then complete the testing the first week or so of January.

Please let me know who will be contacting the licensee and have that person get back to me or Greg with any issues.

thanks...N

Nick & Greg

Please see attached inspection plan for the tritium. Note that the check of the blow down pipe integrity before their next release is your assignment.

Thanks,
Rick

Dave, Nick and Rick, I have spoken with the licensee (Jerry Panfield) on their inspection plans. They will use the "Sahara" acoustical leak detection system from the Pressure Pipe Inspection Co to detect any other leakage sources (other than the vacuum breaker valves) from the 5 miles of affected piping. I plan to go to the site and observe one day of this testing on December 22nd and provide any input and insights to John House for his inspection followup.

Nick, I shouldn't need a TLD, but if you could verify my sight access is still valid I would appreciate it. I will charge my time to your integrated report and the event followup procedure.

Thanks,
