I think so - haven't had much of a chance to get to my email today - so catching up tonight.

We are in the process of drafting a comm plan - Orth is finishing it up tonight and we'll have it in the morning. Includes key messages and Q & As. The plan is to coordinate it through the EDO's office and provide to OCA in support of a potential congressional staff briefing later in the morning on Friday. We had a strategy meeting earlier today to discuss what we knew, what we needed, and who we needed to communicate with. Steve Orth is the lead for the effort. We also plugged in the NRR HP folks.

We issued a PN this afternoon. You should have gotten a copy. I'll forward it just in case via separate email.

The latest info from this afternoon - 3 wells at residences north west of site were sampled and were essentially background. Two pond samples in a vacant lot north of the site (just outside the OCA boundary) measured in the 2400 pCi range. Additional wells are being drilled around the pond (11) as well as wells at one of the previous release points (5) and in the OCA (2). Results will not be available until Saturday. I updated Jim/Geoff and the EDO's office about 5:00 p.m. this afternoon. We have asked the licensee not to dispose of the samples already taken so we can do independent measurements. In addition, for those that we can, we will collect split samples for independent analysis. DNMS is providing support for this.

*EX5*

I'll update you in the morning - just give me a call.

I tried to call but missed you. Do we have control of this?
