NOTATION VOTE

RESPONSE SHEET

то:	Annette Vietti-Cook, Secretary
FROM:	CHAIRMAN DIAZ
SUBJECT:	SECY-06-0126 - PROPOSED RULEMAKING - POWER REACTOR SECURITY REQUIREMENTS (RIN 3150-AG63)
Approved	

COMMENTS:

I approve publishing in the *Federal Register* the proposed amendments to 10 CFR Parts 50, 72, and 73 with appendices, and agree with staff's proposal to certify that the rule will satisfy the requirements of the Regulatory Flexibility Act, 5 U.S.C. 605 (b). Over the past several years the NRC has aggressively enhanced security at nuclear facilities through the issuance of security orders, security evaluations and lessons learned. This rulemaking is a culmination of those activities and will bring closure to these issues. In addition, the Energy Policy Act of 2005 has provided the agency with certain provisions to enhance the security programs at nuclear facilities. Edits are attached for incorporation into the rulemaking package. Further, the Order requirements addressed by the final rule should be rescinded.

(g)(1)(vii) In response to specific threat This requirement would be added to information, implement a two-person require two specific actions to be taken by (line-of-sight) rule for all personnel in the licensee where credible threat vital areas so that no one individual is information is provided. This proposed permitted unescorted access to vital requirement, would first require that the areas. Under these conditions the two-person rule be implemented, and licensee shall implement measures to second, that measures be implemented to verify that the two person rule has been verify that the two-person rule is met when met when a vital area is accessed. access to a vital area is gained. This proposed requirement would include those areas identified in the proposed (e)(8)(iv) to be protected as vital areas.

ordsecut

Table 2- Part 73 Section 7355

§ 73.55(h)(3) The total number of guards, and armed, trained personnel immediately available at the facility to fulfill these response requirements shall nominally be ten (10), unless specifically required otherwise on a case by case basis by the Commission; however, this number may not be reduced to less than five (5) guards. (k)(3)(i)(A) The licensee shall determine
the minimum number of armed
responders necessary to protect against
the design basis threat described in
§ 73.1(a), subject to Commission
approval, and shall document this
number in the approved security plans.

256

This requirement would be retained and revised to remove the specific minimum numbers of 10 but no less than 5, to provide a performance based requirement that meets the proposed requirement of (k)(1)(i). This proposed requirement would enjure that the licensee would provide the requisite number of armed responders needed to carry-out the protective strategy the effectiveness of which would be evaluated through annual exercises and triennial exercises observed by the Commission.

Commissioner McGaffigan's Comments on SECY-06-0126

I approve publication of this proposed rulemaking for public comment, and agree with the staff's proposal to certify that this rule satisfies the requirements of the Regulatory Flexibility Act, 5 U.S.C. 605(b). I would like to laud the work of the staff in putting together a well reasoned, organized and thoroughly conceived rule. In particular, the staff has made a constructive proposal for facilities that will use MOX fuel, and that is consistent with the Commission's action in a recent adjudication. I look forward to comments on the requirements contained in the proposed rule.

Having said that, I believe the rule should explicitly address the need for mitigation of potential insider threats. While the proposed rule text incorporates many of the elements that would serve to identify potential insider threats, additional language is needed to explicitly require the development and implementation of an Insider Mitigation Program and tie together the necessary program elements to allow for meaningful comment. As such, I am attaching proposed additional rule text language to be included in 10 CFR 73.55(b)(7).

The staff's modification to the Appendix B requirements regarding evaluations designed to identify emotional instability in critical personnel, is too narrowly drawn and should be expanded to at least include alarm station operators. Just like armed members of the security organization, CAS and SAS operators serve a critical function, the impairment of which could constitute a significant risk.

Modifications to Appendix G requirements for "Reportable Safeguards Events" should be more narrowly drafted to properly limit the scope of information that falls within the 4-hour reporting requirement set forth in Section III. As currently written, the use of "or other information" in subsection (a) of Section III is too open-ended.

The staff, with assistance from Idaho National Laboratory, has an ambitious plan to revise and update relevant guidance documents. I agree with Commissioner Jaczko that the staff should strive to make as much of the implementing guidance as possible publicly available. I recognize that some elements of the guidance will be considered Safeguards Information or sensitive unclassified information, and therefore could not be included in a public document. In such cases, the public version of the document could indicate that additional guidance is provided in the Safeguards Information version of the document. The staff should provide the guidance documents to the Commission for information when they are issued for comment.

Finally, while this rule will go a long way towards creating the necessary stability for applicants and licensees, particularly as we prepare for new reactor licensing, the security orders addressed in large part through this rulemaking should remain in place. Rescission of these orders automatically upon completion of the final rule is neither necessary nor prudent. When this rule is final, existing licensees will be required to examine their security plans to ensure compliance with the new regulations. While most licensees may not need to make any modifications, there is a chance that some changes will be necessary or they will need to seek relief. Following this review, some licensees may, in accordance with the terms of the orders, seek relaxation of order provisions or amendment of their licenses if necessary.

ADD new Rule text to 73.55(b)(7):

(i) In addition to the access authorization program required above, and the fitness-for-duty program required in part 26 of this chapter, each licensee shall develop and implement an insider mitigation program.

(ii) The insider mitigation program must be designed to oversee and monitor the initial and continuing trustworthiness and reliability of individuals granted or retaining unescorted access authorization to a protected or vital area and implement defense-in-depth methodologies to minimize the potential for an insider to adversely affect, either directly or indirectly, the licensee capability to prevent significant core damage or spent fuel sabotage.

ADD new Rule text and Considerations to Table 2:

Current Requirement	Proposed Requirement	Considerations
	73.55(b)(7)(i) In addition to the access authorization program required above, and the fitness-for-duty program required in part 26 of this chapter, each licensee shall develop and implement an insider mitigation program.	This proposed requirement would be added to establish the insider mitigation program (IMP). The licensee's IMP should integrate specific elements of the licensee AA and FFD programs to focus those elements on identifying potential insider threats and denying the opportunity for an insider to gain or retain access at an NRC licensed facility.

	73.55(b)(7)(ii) The insider mitigation program must be designed to oversee and monitor the initial and continuing trustworthiness and reliability of any individual granted or retaining unescorted access authorization to a protected or vital area and implement defense-in- depth methodologies to minimize the potential for an insider to adversely affect, either directly or indirectly, the licensee capability to prevent significant core damage or spent fuel sabotage.	This proposed requirement would be added to provide a performance based requirement for the design and content of the IMP. The Commission has concluded that, by itself, the initial determination of trustworthiness and reliability is not adequate to minimize the potential opportunity for an insider to gain or retain access, and that only through continual re-evaluation of the information obtained through these processes can the licensee provide the level of assurance necessary. The Commission has also determined that defense-in- depth would be provided through the integration of physical protection measures with access authorization and fitness-for-duty program elements, to ensure the licensee capability to identify and mitigate the potential activities of an insider, such as, but not limited to, tampering. The Commission does not intend that a licensee would limit the IMP to any one or more elements, but rather that the licensee would identify and add additional elements as necessary to ensure the site's IMP satisfies the performance requirements specified by the Commission.
L	·	
	· · · · · · · · · · · · · · · · · · ·	

.

• • .

in the second second

	The Commission has determined that no one element of the physical protection program, access authorization program, or fitness-for-duty program would, by itself, provide the level of protection against the insider necessary to meet the performance objective of the proposed paragraph (b) and therefore, the effective integration of these three programs is a necessary requirement to achieve defense-in-depth against the potential insider.

NRC Form 754) to the list of sections and forms with Office of Management of Management Budget (OMB) information collection requirements. A corrective

revision to § 73.8 would also be made to reflect OMB approval of existing

information collection requirements for NRC Form 366 under existing § 73.71.

Section 73.70, "Records" would be revised to reference the appropriate revised paragraph numbers in proposed § 73.55 regarding the need to retain a record of the registry of visitors.

Additionally, § 73.81(b), "Criminal penalties" which sets forth the sections within Part 73 that are not subject to criminal sanctions under the AEA, would remain unchanged since willful violations of the newly proposed §§ 73.18, 73.19, and 73.58 may be subject to criminal sanctions.

and the second second

Appendix B and Appendix C to Part 73 require special treatment in this rulemaking to preserve, with a minimum of conforming changes, the current requirements for licensees and applicants to whom this proposed rule would not apply. Accordingly, section I through V of Appendix B would remain unchanged, and the proposed new language for power reactors would be added as section VI. Appendix C would be divided into two sections, with Section I maintaining all current requirements, and Section II containing all proposed requirements related to power reactors.

II. Rulemaking Initiation

On July 19, 2004, NRC staff issued a memorandum entitled "Status of Security-Related Rulemaking" (accession number ML041180532) to inform the Commission of plans to close former security-related actions and replace them with a comprehensive rulemaking plan to modify physical protection requirements for power reactors. This memorandum described rulemaking efforts that were suspended by the terrorist activities of September 11, 2001, and summarized the security-related actions taken following the attack. In response to this memorandum, the Commission directed the staff in an August 23, 2004, Staff Requirements Memorandum (SRM) (COMSECY-04-0047, accession number ML042360548) to forego the development of a rulemaking plan, and provide a schedule for the completion of security-related rulemakings. The staff provided this schedule to the Commission by memorandum dated November 16, 2004 (accession number ML043060572). Subsequently, the staff revised its plans to amend the Part 73 security requirements to include a requirement for licensees to assess and manage site activities that could compromise either safety or security (i.e., the safety/security interface requirements). This revision is discussed in a memorandum dated July 29, 2005 (accession number ML051800350). Finally, by memorandum dated September 29, 2005 (COMSECY-05-0046, accession number ML052710167), the staff discussed its plans to incorporate select provisions of the EPAct 2005 into the power reactor security requirements rulemaking. In COMSECY-05-0046, dated November 1, 2005 (accession number ML053050439), the Commission approved the staff's approach in incorporating the select provisions of EPAct 2005.

III. Proposed Regulationsnote: Side 52 of EMetThis section describes significant provisions of this rulemaking:It AEA of 1954 cmIt AEA of (AEA)Commuted (AEA)

1. <u>EPAct 2005 weapons requirements</u>. The new §§ 73.18 and 73.19 would contain the transfer requirements to implement provisions of Sec. 161A. of the AEA. In § 73.18, the NRC would propose firearms background check requirements and would also propose a new NRC Form 754 for licensee security personnel's submission to transfer for accomplish these firearms background checks under the FBI's NICS database. In § 73.19, the NRC would propose requirements to support a licensee obtaining enhanced weapons under an ATF firearms license. <u>Safety/Security interface requirements</u>. These requirements are located in proposed § 73.58. The safety/security requirements are intended to explicitly require licensee coordination of potential adverse interactions between security activities and other plant activities that could compromise either plant security or plant safety. The proposed requirements would direct licensees to assess and manage these interactions so that neither safety nor security is compromised. These proposed requirements address, in part, a Petition for Rulemaking (PRM 50-80) that requested the establishment of regulations governing proposed changes to the facilities which could adversely affect the protection against radiological sabotage.

2.

- 3. <u>EPAct 2005 additional requirements</u>. The EPAct 2005 requirements that would be implemented by this proposed rulemaking, in addition to the weapons-related additions described above, consist of new requirements to perform force-onforce exercises, and to mitigate potential conflicts of interest that could influence the results of NRC-observed force-on-force exercises. These proposed new requirements would be included in proposed § 73.55 and Appendix C to Part 73.
 - 4. <u>Accelerated notification and revised four-hour reporting requirements</u>. This proposed rule contains accelerated security notification requirements (i.e., within 15 minutes) in proposed § 73.71 and Appendix G to Part 73 for attacks and imminent threats to power reactors. The proposed accelerated notification requirements are similar to what was provided to the industry in NRC Bulletin 2005-02, "Emergency Preparedness and Response Actions for Security-Based Events," dated July 18, 2005. The proposed rule also contains two new four-

hour reporting requirements. The proposed rule would direct licensees to report to the NRC information pertaining to suspicious activities as described in the proposed requirement. The proposed rule would also include a new four-hour reporting requirement for tampering events that do not meet the current threshold for one-hour reporting.

Mixed-oxide (MOX) fuel requirements. These requirements would be incorporated into proposed § 73.55 for licensees who propose to use MOX fuel in their reactor(s). These proposed requirements are in lieu of unnecessarily rigorous Part 73 requirements (e.g., §§ 73.45 and 73.46), which would otherwise apply because of the mixed oxide (MOX) fuel's low plutonium content and the weight and size of the MOX fuel assemblies. The proposed MOX fuel security requirements are intended to be consistent with the approach implemented by Catawba through the MOX lead test assembly effort.

Nuclear Station

6.

7.

5.

Cyber-security requirements. This proposed rule would contain more detailed programmatic requirements for addressing cyber security at power reactors, which build on the requirements imposed by the February 2002 ørder. The proposed cyber-security requirements are designed to be consistent with ongoing industry cyber-security efforts.

Mitigating strategies. The proposed rule would require licensees to develop specific guidance and strategies to maintain or restore core cooling, containment, and spent fuel pool cooling capabilities using existing or readily available resources (equipment and personnel) that can be effectively

rule would also add new requirements, including predefined provisions for the suspension of safeguards measures for severe weather conditions that could result in life-threatening situations for security personnel (e.g., tornadoes, floods, and hurricanes), and reduced overly-prescriptive requirements through the inclusion of performance-based language to allow flexibility in the methods used to accomplish requirements.

and the second second

IV. Section-by-Section Analysis

This proposed rulemaking would implement new weapons requirements that stem from the EPAct 2005. This is the only portion of this proposed rulemaking that involves facilities other than nuclear power reactors. The newly proposed weapons requirements would apply to power reactors and facilities authorized to possess a formula quantity or greater of strategic special nuclear material whose security plans are governed by §§ 73.20, 73.45, and 73.46. The new requirements would be in three different sections and an NRC Form:

Revised proposed § 73.2 "Definitions"

Proposed § 73.18, "Firearms background checks for armed security personnel"
 Proposed § 73.19, "Authorization for use of enhanced weapons"

 Proposed NRC Form 754, "Armed Security Personnel Background Check"
 Proposed § 73.18 would contain requirements that implement provisions of new Sec. 161A. of the AEA (under Sec. 653 of the EPAct 2005) concerning firearms background checks for armed security personnel. This new section would require background checks that include fingerprinting and checks against the FBI's NICS. Security personnel protecting power reactors and Category I SSNM facilities are currently subject to background checks, including fingerprints, because they have unescorted access at such facilities. However, these security

personnel have not previously been subject to a check against the NICS database because the access authorization background checks were not intended to perform the entire scope of checks required for firearms possession. Although licensee security personnel possessing weapons have always had to comply with the federal regulations for firearms possession, the NRC did not have the authority to perform these checks. This proposed requirement would provide a process for conducting the NICS checks.

Implementation of the proposed § 73.18 background checks would be via proposed NRC Form 754, which armed security personnel would be required to complete. The NRC would forward the NRC Form 754 information to the FBI for evaluation, and upon completion of the FBI evaluation, inform licensees of the result. The result would be either "proceed," (As defined in $28 \ CFR$ Pail 35 "denied," or "delayed." Proposed § 73.18 would be structured to readily enable revisions in the future, should NRC decide to expand the proposed rulemaking provisions to apply to other types of facilities and licensees.

Proposed § 73.19 would contain requirements that implement provisions of new Sec. 161A. of the AEA concerning the use of enhanced weapons to protect facilities, radioactive material, or other property as determined by the Commission. The proposed § 73.19 would authorize (not require) power reactors and facilities authorized to possess formula quantities of strategic special nuclear material (i.e., Category I SSNM) to incorporate the use of enhanced weapons into their protective strategy. Affected Category I licensees would include production facilities, spent fuel reprocessing or recycling facilities, fuel fabrication facilities, and uranium enrichment facilities. However, this would not include hot cell facilities, independent spent fuel storage installations, monitored retrievable storage installations, and a geologic repository operations area. The NRC plans to address whether the deployment of enhanced weapons is appropriate for these and other types of facilities, radioactive material, or other property in separate rulemaking(s). Furthermore, Sec. 161A. of the AEA takes effect upon the issuance of guidelines by the Commission, with the approval of the Attorney General. As indicated previously, the Commission intends to provide public notice of the issuance of these guidelines in a separate *Federal Register* notice to be published no later than the final rule on this action.

To implement the new weapons provisions, three new terms would be added to § 73.2: covered weapon, enhanced weapon, and standard weapon.

>The proposed new weapons requirements and supporting discussion for the proposed language are set forth in more detail (including the proposed new definitions) in Table 1.

and the second second

IV.2. Section 73.55, "Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage."

Proposed § 73.55 contains security program requirements for power reactor licensees. The security program requirements in § 73.55 would apply to all nuclear power plant licensees that hold a 10 CFR Part 50 license and to applicants who are applying for either a Part 50 license or a Part 52 combined license. Paragraph (a) of § 73.55 would identify the licensees and applicants for which the requirements apply, and the need for submitting to NRC (for review and approval) a "Physical Security Plan," a "Training and Qualification Plan," and a "Safeguards Contingency Plan." Paragraph (b) of § 73.55 would set forth the performance objectives that govern power reactor security programs. The remaining paragraphs of § 73.55 would implement the detailed requirements for each of the security plans, as well as for the various features of physical security.

This section would be extensively revised in an effort to make generically applicable security requirements imposed by Commission orders issued after the terrorist attacks of September 11, 2001, based upon experience and insights gained by the Commission during implementation, fulfill certain provisions of the Energy Policy Act-of-2005, and add several new

requirements that resulted from evaluation insights from implementation of the security orders, review of site security plans, and implementation of the enhanced baseline inspection program and force-on-force exercises. The proposed regulations would require an integrated security plan that begins at the owner controlled area boundary and would implement defense-in-depth concepts and protective strategies based on protecting target sets from the various attributes of the design basis threat. Notable additions to the proposed § 73.55 are summarized below:

Cyber Security Requirements

The current security regulations do not contain requirements related to cyber security. Subsequent to the events of September 11, 2001, the NRC issued orders to require power reactor licensees to implement measures to enhance cyber security. These security measures required an assessment of cyber systems and the implementation of corrective measures sufficient to provide protection against the cyber threats at the time the orders were issued.

The proposed requirements maintain the intent of the security order by establishing the requirement for a cyber security program to protect any system that, if compromised, can adversely impact safety, security or emergency preparedness.

Requirements for CAS and SAS to Have Functionally Equivalent Capabilities

Such That No Single Act Can Disable the Function of CAS and SAS

Current regulatory requirements ensure that both CAS and SAS have equivalent alarm annunciation and communication capabilities, but do not explicitly require equivalent assessment, monitoring, observation, and surveillance capabilities. Further, the current requirement of § 73.55(e)(1) states "All alarms required pursuant to this part must annunciate in a continuously manned central alarm station located within the protected area and in at least one other continuously manned station not necessarily onsite, so that a single act cannot remove the capability of calling for assistance or otherwise responding to an alarm." The Commission orders added enhanced detection and assessment capabilities, but did not require

equivalent capabilities for both CAS and SAS. The security plans approved by the Commission on October 29, 2004, varied, due to the performance-based nature of the requirements, with respect to how the individual licensees implemented these requirements, but all sites were required to provide a CAS and SAS with functionally equivalent capabilities to support the implementation of the site protective strategy.

The proposed rule extends the requirement for no single act to remove capabilities to the key functions required of the alarm stations and would require licensees to implement protective measures such that a single act would not disable the intrusion detection, assessment, and communications capabilities of both the CAS and SAS. This proposed requirement would ensure continuity of response operations during a security event by ensuring that the detection, assessment, and communications functions required to effectively implement the licensee's protective strategy are maintained despite the loss of one or the other alarm station. For the purposes of assessing the regulatory burden of this proposed rule, the NRC assumed that all licensees would require assessments and approximately one third of the licensees would choose to implement hardware modifications.

The NRC has concluded that protecting the alarm stations such that a single act does not disable the key functions would provide an enhanced level of assurance that a licensee can maintain detection, assessment and communications capabilities required to protect the facility against the design basis threat of radiological sabotage. For new reactor licensees, licensed after the publication of this rule, the Commission would require CAS and SAS to be designed, constructed, and equipped with equivalent standards.

Uninterruptible Power for Intrusion Detection and Assessment Systems

Current regulatory requirements require back-up power for alarm annunciation and nonportable communication equipment, but do not require this back-up power to be uninterruptible. Although not specifically required, many licensees have installed uninterruptible power to their security systems for added reliability of these electronic systems. However, the Commission has not required uninterruptible power for assessment systems. For the purposes of assessing the regulatory burden of this proposed rule, the NRC assumed that only a small number of licensees would require hardware modifications to meet this proposed requirement.

Through implementation of the Commission-approved security plans, baseline inspections, and force-on-force testing, the NRC has concluded that uninterruptible back-up power would provide an enhanced level of assurance that a licensee can maintain detection, assessment and communication capabilities required to protect the facility against the design basis threat of radiological sabotage. This new requirement would reduce the risk of losing detection, assessment, and communication capabilities during a loss of the normal power supply.

"Video-Capture" Capability

Current regulatory requirements address the use of closed circuit television systems, but do not explicitly require them. Although not specifically required, all licensees have adopted the use of video surveillance in their site security plans. Many of the licensees have adopted advanced video surveillance technology to provide real-time and play-back/recorded video images to assist security personnel in determining the cause of an alarm annunciation. For the purposes of assessing the regulatory burden of this proposed rule, the NRC assumed that a small percentage of licensees would require hardware modifications to comply with this proposed requirement for advanced video surveillance technology.

.

Through implementation of the Commission-approved security plans, baseline inspections, and force-on-force testing, the NRC has concluded that advanced video technology would provide an enhanced level of assurance that a licensee can assess the cause of an alarm annunciation and initiate a timely response capable of defending the facility against

2001. Licensees have always been required to ensure that any changes to safety functions, systems, programs, and activities do not have unintended consequences on other facility safety functions, systems, programs, and activities. Likewise, licensees have been required to ensure that any changes to security functions, systems, programs, and activities do not have unintended consequences on other facility security functions, systems, programs, and activities. However, the Commission has concluded that the pace, number, and complexity of these security changes warrant the establishment of a more formal program to ensure licensees χ properly assess the safety/security interface in implementing these changes.

On April 28, 2003, the Union of Concerned Scientists and the San Luis Obispo Mothers for Peace submitted a petition for rulemaking (PRM-50-80) requesting that, in part, the NRC's regulations establishing conditions of licenses and requirements for evaluating proposed changes, tests, and experiments for nuclear power plants be amended to require licensee evaluation of whether the proposed changes, tests, and experiments cause protection against radiological sabotage to be decreased and, if so, that the changes, tests, and experiments only be conducted with prior NRC approval. In SECY-05-0048, dated March 28, 2005, the NRC staff recommended that the Commission approve rulemaking for the requested action, but did not necessarily endorse the specific amendments suggested by the petition. In SECY-05-0048, dated June 28, 2005, the Commission directed the staff to develop the technical basis for such a rule and to incorporate its provisions within the ongoing power reactor security requirements rulemaking. This proposed rule addresses, in part, the petitioner's request by incorporating proposed § 73.58 within this rulemaking.

The Commission has determined that the proposed safety/security interface rule requirements are necessary because the current regulations do not specifically require evaluation of the effects of plant changes on security or the effects of security changes on plant safety. Further, current regulations do not require communication about the implementation and timing of changes, which would promote awareness of the effects of changing facility conditions and result in appropriate assessment and response.

The NRC is aware of a number of occurrences of adverse safety/security interactions at nuclear power plants over the years to justify consideration of a new rule. Examples of adverse interactions include: (1) Inadvertent security barrier breaches while performing maintenance activities (e.g., cutting of pipes that provided uncontrolled access to vital areas, removing ventilation fans or other equipment from vital area boundary walls without taking compensatory measures to prevent uncontrolled access into vital areas); (2) Blockage of bullet resisting enclosure's (or other defensive firing position's) fields of fire; (3) Erection of scaffolding and other equipment without due consideration of its impact on the site's applicable physical protection strategy; and (4) Staging of temporary equipment within security isolation zones.

Security could also adversely affect operations because of inadequate staffing of security force personnel on backshifts, weekends, and holidays, to support operations during emergencies (e.g., opening and securing vital area access doors to allow operations personnel timely access to safety-related equipment). Also, security structures, such as vehicle barriers, delay barriers, rerouted isolation zones, or defensive shields could adversely affect plant equipment such as valve pits, fire stations, other prepositioned emergency equipment, blowout panels, or otherwise interfere with operators responding to plant events.

The NRC considered many factors in developing this proposed new requirement. One of the factors considered is that existing change processes are focused on specific areas of plant activities, and that implementation of these processes is generally well understood by licensees. An example is found in § 50.54(p), which provides that a reactor licensee may make changes to its safeguards contingency plans without Commission approval provided that the changes do not decrease the safeguards effectiveness of the plan. Similarly, § 50.65(a)(4) provides that a reactor licensee shall assess and manage the increase in risk that may result

from proposed maintenance activities. However, neither §§ 50.54(p) (security) nor 50.65(a)(4) (safety) require that an assessment for potential adverse impacts on safety/security interface be made before the proposed changes are implemented. The proposed § 73.58 would address this gap by requiring that, before implementing allowed changes, licensees must assess the changes with respect to the safety/security interface and, if potential adverse interactions are identified, take appropriate compensatory and/or mitigative action before making the changes.

The proposed rule reflects a performance-based approach and language which is sufficiently broad that, in addition to operating power reactors, it could be applied to other classes of licensees in separate rulemaking(s), if conditions warrant. In addition to the requirements in proposed § 73.58, a new definition for safety/security interface would be added to § 73.2.

Table 4 sets forth the proposed § 73.58 language and provides the supporting discussion for the proposed language, including a new definition for *safety/security interface* that would be added to § 73.2.

IV.5. Section 73.71 "Reporting of safeguards events."

The events of September 11, 2001, emphasized the need for the capability to respond to coordinated attacks that could pose an imminent threat to national infrastructure such as nuclear power reactor sites. Prompt licensee notification to the NRC of a security event involving an actual or imminent threat would initiate the NRC's alerting mechanism for other nuclear facilities in recognition that an attack or threat against a single facility may be the prelude to attacks or threats against multiple facilities. In either case, timely communication of this event to the NRC, and the NRC's communication of the threat or attack to other licensees could reduce the adversaries ability to engage in coordinated attacks and would strengthen the licensees' response posture. NRC would also initiate notifications to the Homeland

Security/Federal response networks for an "Incident of National Significance," as defined by the National Response Plan (NRP).

Currently, § 73.71(b)(1) requires power reactor licensees to notify the NRC within one hour of discovery, as described in Paragraph I of Appendix G to 10 CFR Part 73, "Reportable safeguards events." In addition, § 50.72 establishes reporting requirements for events requiring an emergency declaration in accordance with a licensee's emergency plan. Licensee notification under § 50.72(a)(3) is required only after the threat is assessed, an "Emergency Class" is declared, and initial notification of appropriate State and local agencies are completed first (i.e., not upon discovery). The current timing of requirements of this notification would not allow the NRC to warn other licensees of a potential threat to their facilities in a prompt manner to allow other licensees to change their security posture in advance of a threat or potential attack. The Commission has previously advised licensees of the need to expedite their initial notification to the NRC. The proposed accelerated notification requirements are similar to that security provided to licensees in NRC Bulletin 2005-02, "Emergency Preparedness and Response Actions for Security-Based Events," dated July 18, 2005.

The proposed amendments to § 73.71 would add a new expedited notification requirement for licensees subject to the provisions of § 73.55 to notify the NRC Operations Center as soon as possible after the discovery of an imminent or actual threat against the facility as described in Appendix G, but not later than 15 minutes of discovery. The proposed amendments to § 73.71 and Appendix G would also add two additional four-hour notification requirements for suspicious events and tampering events not otherwise covered under Appendix G. The proposed § 73.71 would retain the requirement for the licensee to maintain a continuous communications channel for one-hour notifications upon request of the NRC. The proposed rule would not require a continuous communications channel for four-hour notifications, because of the lesser degree of urgency of these events. For 15-minute

Table 11 (See Section VIII) is a cross-reference showing where individual requirements of the current regulation would be in the proposed regulation.

IV.8. Appendix G to Part 73, "Reportable Safeguards Events."

Proposed Appendix G to Part 73 provides requirements regarding the reporting of safeguards events. Proposed Appendix G would contain changes to support the revised and accelerated reporting requirements which would be incorporated into this rulemaking.

Proposed Appendix G would also contain revised four-hour reporting requirements that would require licensees to report to the NRC information of suspicious surveillance activities, attempts at access or other information. Following September 11, 2001, the NRC issued guidance requesting that licensees report suspicious activities near their facilities to allow assessment by the NRC and other appropriate agencies. The proposed new reporting requirement will clarify this expectation to assure consistent reporting of this important information. Additionally, the proposed rule contains an additional four-hour reporting requirement for tampering events that do not meet the threshold for reporting under the current one-hour requirements. The proposed reporting requirements for tampering events will allow NRC assessment of these events. Table 8 sets forth the proposed amendments to Appendix G and provides the supporting discussion for the proposed language.

IV.9 Conforming and Corrective Changes.

The following conforming changes would also be made: §§ 50.34 and 50.54 (references to the correct paragraphs of revised Appendix C of Part 73), § 50.72 (changes to § 73.71 reports), §§ 72.212 and 73.70 (references to the correct paragraphs due to renumbering of § 73.55), and § 73.8 (adding § 73.18, § 73.19, and revised to reflect new NRC form 754 to

reflect recordkeeping or reporting burden). A corrective change would also be made to § 73.8 to reflect an existing recordkeeping or reporting burden for NRC Form 366 under § 73.71. However, no changes would be made to § 73.81(b) (due to the new §§ 73.18, 73.19, and 73.58), because willful violations of §§ 73.18, 73.19, and 73.58 may be subject to criminal penalties.

V. Guidance

The NRC is preparing new regulatory guides that will contain detailed guidance on the implementation of the proposed rule requirements. These regulatory guides, currently under development, will consolidate and update or eliminate previous guidance that was used to develop, review, and approve the power reactor security plans that licensees revised in response to the post-September 11, 2001, security orders. Development of the regulatory guides is ongoing and the publication of the regulatory guides is planned after the publication of the final rule. Because this regulatory guidance may contain Safeguard Information (SGI) and/or classified information, these documents would only be available to those individuals with a need-to-know, and are qualified to have access to SGI and/or classified information, as h_{as} determined applicable. However, the NRC considers that access to these guidance documents is not necessary for the public or other stakeholders to provide informed comment on this proposed rule.

. . .

VI. Criminal Penalties

·

 $t + s^{-1}$

For the purposes of Section 223 of the Atomic Energy Act, as amended, the Commission is proposing to amend 10 CFR Parts 50, 72, and 73 under Sections 161b, 161i, or 161o of the AEA. Criminal penalties, as they apply to regulations in Part 73, are discussed in § 73.81. The new §§ 73.18, 73.19, and 73.58 are issued under Sections 161b, 161i, or 161o of the AEA, and are not included in § 73.81(b).

;

1 .

VII. Compatibility of Agreement State Regulations

Under the "Policy Statement on Adequacy and Compatibility of Agreement States Programs," approved by the Commission on June 20, 1997, and published in the Federal Register (62 FR 46517; September 3, 1997), this rule is classified as compatibility "NRC." Compatibility is not required for Category "NRC" regulations. The NRC program elements in this category are those that relate directly to areas of regulation reserved to the NRC by the AEA or the provisions of Title 10 of the Code of *Federal Regulations* (10 CFR), and although an Agreement State may not adopt program elements reserved to NRC, it may wish to inform its licensees of certain requirements via a mechanism that is consistent with the particular State's administrative procedure laws, but does not confer regulatory authority on the State.

VIII. Availability of Documents.

The following table indicates which documents relating to this rulemaking are available to the public and how they may be obtained.

Public Document Room (PDR). The NRC's Public Document Room is located at the NRC's headquarters at 11555 Rockville Pike, Rockville, MD 20852.

Rulemaking Website (Web). The NRC's interactive rulemaking Website is located at http://ruleforum.llnl.gov. These documents may be viewed and downloaded electronically via this Website.

the terrorist attacks of September 11, 2001, based upon experience and insights gained by the Commission during implementation, (2) fulfill certain provisions of the Energy Policy Act of 2005, (3) add several new requirements that resulted from insights from implementation of the security orders, review of site security plans, and implementation of the enhanced baseline inspection program and force-on-force exercises, (4) update the regulatory framework in preparation for receiving license applications for new reactors, and (5) impose requirements to assess and manage site activities that can adversely affect safety and security. The proposed safety and security requirements would address, in part, a Petition for Rulemaking (PRM 50-80) that requested the establishment of regulations governing proposed changes to facilities which could adversely affect the protection against radiological sabotage.

The U.S. Nuclear Regulatory Commission is seeking public comment on the potential impact of the information collections contained in this proposed rule and on the following issues:

1. Is the proposed information collection necessary for the proper performance of the functions of the NRC, including whether the information will have practical

2. Is the estimate of burden accurate?

utility?

. . .

.l.

3. Is there a way to enhance the quality, utility, and clarity of the information to be collected?

1999 - 1999 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 - 1997 -

.

4. How can the burden of the information collection be minimized, including the use of automated collection techniques?

A copy of the OMB clearance package may be viewed free of charge at the NRC Public Document Room, One White Flint North, 11555 Rockville Pike, Room O-1 F21, Rockville, MD 20852. The OMB clearance package and rule are available at the NRC worldwide Web site: <u>http://www.nrc.gov/public-involve/doc-comment/omb/index.html</u> for 60 days after the signature date of this notice and are also available at the rule forum site, <u>http://ruleforum.llnl.gov</u>.

and the second second

Send comments on any aspect of these proposed information collections, including suggestions for reducing the burden and on the above issues, by (INSERT DATE 30 DAYS AFTER PUBLICATION IN THE *FEDERAL REGISTER*) to the Records and FOIA/Privacy Services Branch (T-5 F52), U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, or by Internet electronic mail to INFOCOLLECTS@NRC.GOV and to the Desk Officer, John A. Asalone, Office of Information and Regulatory Affairs, NEOB-10202, (3150-0002, 3150-0011, and 3150-new), Office of Management and Budget, Washington, DC 20503. Comments received after this date will be considered if it is practical to do so, but assurance of consideration cannot be given to comments received after this date. You may also e-mail comments to John_A._Asalone@omb.eop.gov or comment by telephone at (202) 395-4650.

XIII. Public Protection Notification

and the gradient of the second sec

The NRC may not conduct or sponsor, and a person is not required to respond to, a request for information or an information collection requirement unless the requesting document displays a currently valid OMB control number.

(2) A hearing aid is acceptable provided suitable testing procedures demonstrate auditory acuity equivalent to the hearing requirement.

(3) The use of a hearing aid may not decrease the effective performance of the individual's assigned security job duties during normal or emergency operations.

d. Existing medical conditions.

· · · · ·

(1) Individuals may not have an established medical history or medical diagnosis of existing medical conditions which could interfere with or prevent the individual from effectively performing assigned duties and responsibilities.

and the second second

(2) If a medical condition exists, the individual shall provide medical evidence that the condition can be controlled with medical treatment in a manner which does not adversely affect the individual's fitness-for-duty, mental alertness, physical condition, or capability to otherwise effectively perform assigned duties and responsibilities.

e. Addiction. Individuals may not have any established medical history or medical diagnosis of habitual alcoholism or drug addiction, or, where this type of condition has existed, the individual shall provide certified documentation of having completed a rehabilitation program which would give a reasonable degree of confidence that the individual would be capable of effectively performing assigned duties and responsibilities.

f. Other physical requirements. An individual who has been incapacitated due to a serious illness, injury, disease, or operation, which could interfere with the effective

performance of assigned duties and responsibilities shall, before resumption of assigned duties and responsibilities, provide medical evidence of recovery and ability to perform these duties and responsibilities.

and the second second

3. Psychological qualifications.

a. Armed and unarmed members of the security organization shall demonstrate the ability to apply good judgment, mental alertness, the capability to implement instructions and assigned tasks, and possess the acuity of senses and ability of expression sufficient to permit accurate communication by written, spoken, audible, visible, or other signals required by assigned duties and responsibilities.

paragraphs II and IV of this appendix. Licensees shall make such reports to the Commission under the provisions of § 73.71 of this part.

I. Events to be reported as soon as possible, but no later than 15 minutes after discovery, followed by a written report within sixty (60) days.

(a) The initiation of a security response consistent with a licensee's physical security plan, safeguards contingency plan, or defensive strategy based on actual or imminent threat against a nuclear power plant.

(b) The licensee is not required to report security responses initiated as a result of information communicated to the licensee by the Commission, such as the threat warning system addressed in Appendix C to this part.

II. Events to be reported within one (1) hour of discovery, followed by a written report within sixty (60) days.

(a) Any event in which there is reason to believe that a person has committed or caused, or attempted to commit or cause, or has made a threat to commit or cause:

(1) A theft or unlawful diversion of special nuclear material; or

(2) Significant physical damage to any NRC-licensed power reactor or facility possessing strategic special nuclear material or to carrier equipment transporting nuclear fuel, \mathcal{T}_{ux} or to the nuclear fuel or spent nuclear fuel facility which is possessed by a carrier; or (3) Interruption of normal operation of any NRC licensed nuclear power reactor through the unauthorized use of or tampering with its components, or controls including the security system.

(b) An actual or attempted entry of an unauthorized person into any area or transport for which the licensee is required by Commission regulations to control access.

جاجي الجاد الجاري المحاجر

(c) Any failure, degradation, or the discovered vulnerability in a safeguard system that could allow unauthorized or undetected access to any area or transport for which the licensee is required by Commission regulations to control access and for which compensatory measures have not been employed.

and the second second

(d) The actual or attempted introduction of contraband into any area or transport for which the licensee is required by Commission regulations to control access.

III. Events to be reported within four (4) hours of discovery. No written followup report is required.

a protession de las

(a) Any other information received by the licensee of suspicious surveillance activities, attempts at access, or other information, including:

•

, ·

(1) Any security-related incident involving suspicious activity that may be indicative of potential pre-operational surveillance, reconnaissance, or intelligence-gathering activities directed against the facility. Such activity may include, but is not limited to, attempted surveillance or reconnaissance activity, elicitation of information from security or other site

quantities or greater of strategic special nuclear material, i.e., Category I SSNM facilities. Such facilities would include: production facilities, spent fuel reprocessing facilities, fuel processing facilities, and uranium enrichment facilities. The NRC plans to address separately whether the deployment of enhanced weapons is appropriate for other types of facilities, radioactive materials, or other property. Additionally, Section 651 of the EPAct 2005 requires the NRC to conduct security evaluations at selected licensed facilities, including periodic force-on-force exercises. That provision also requires the NRC to mitigate any potential conflict of interest that could influence the results of force-on-force exercises. These provisions would be reflected in proposed § 73.55.

and the second second second

1.3 Regulatory Objectives

The NRC has five objectives for the current rulemaking. The first objective is to make generically applicable security requirements imposed by Commission orders issued after the terrorist attacks of September 11, 2001, based upon experience and insights gained by the Commission during implementation.¹ The second objective is to fulfill certain provisions of the Energy Policy Act of 2005. The third objective is to add several new requirements that resulted from insights from implementation of the security orders, review of site security plans, and implementation of the enhanced baseline inspection program and force-on-force exercises. The fourth objective is to update the regulatory framework in preparation for receiving license applications for new reactors. The fifth objective is to impose requirements to assess and manage site activities that can adversely affect safety and security. The proposed safety and security requirements would address, in part, a Petition for Rulemaking (PRM 50-80) that requested the establishment of regulations governing proposed changes to facilities which could adversely affect the protection against radiological sabotage.

2. Identification and Preliminary Analysis of Alternative Approaches

This section presents preliminary analysis of the alternatives that the staff considered to meet the regulatory goals identified in the previous section. (Section 4 presents a more detailed analysis of the proposed rule option.) The staff considered two alternatives for revising Part 73's power plant security provisions as discussed below.

2.1 Option 1: No Action

Under Option 1, the no-action alternative, NRC would not amend the current regulations regarding power reactor security. Licensees would continue to comply with the Commission's security orders. This option would avoid certain costs that the proposed rule would impose. However, taking no action would not improve security measures as authorized by the EPAct 2005 or establish regulatory requirements for lessons learned. Additionally, taking no action would present a problem for establishing appropriate security measures for new reactors that did not receive orders.

¹ Specific details related to requirements that are safeguards information (SGI) will not be specified in regulations but will be available only to those with appropriate clearance and need to know.

Regulatory Analysis of Proposed Revisions to 10 CFR Part 73

2.2. Option 2: Amend Regulations to Enhance Power Reactor Security Operations

Under Option 2, NRC would conduct a rulemaking to address changes in several sections of 10 CFR Part 73 to enhance security operations at power reactors. These changes entail: (1) amending 10 CFR 73.2 to add definitions; (2) revising 10 CFR 73.55, 73.56, 73.71, Appendix B, Appendix C, and Appendix G; (3) adding 10 CFR 73.58 to introduce "safety/security interface" requirements, and (4) adding § 73.18, § 73.19, and Form 754 to implement EPAct 2005 provisions for background checks and authorization for use of enhanced weapons.

A comprehensive rulemaking would provide a means of addressing the identified issues and concerns with respect to Part 73. Through a comprehensive revision, the NRC could (1) ensure that all licensees would consistently implement measures to enhance security and safety at nuclear power plants; (2) modify current requirements to provide licensees with some flexibility; (3) address adjustments and changes in security plans that licensees have adopted through the development of the revised licensee security plans; (4) clarify the language of the rule; and (5) incorporate changes to address the requirements in the EPAct 2005

The NRC has estimated the benefits and costs of this option, as described in Sections 3 and 4 of this regulatory analysis, and has pursued Option 2 for the reasons discussed in Section 5.

3. Evaluation of Benefits and Costs

This section examines the benefits (values) and costs (impacts or burdens) expected to result from this rulemaking, and is presented in two subsections. Section 3.1 identifies attributes that are expected to be affected by the rulemaking. Section 3.2 describes how benefits and costs have been analyzed.

3.1 Identification of Affected Attributes

This section identifies the factors within the public and private sectors that the regulatory alternatives (discussed in Section 2) are expected to affect. These factors are classified as "attributes" using the list of potential attributes provided by NRC in Chapter 5 of its *Regulatory Analysis Technical Evaluation Handbook.*² Affected attributes include the following:

Safeguards and Security Considerations – The proposed actions are intended to establish requirements that will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public heath and safety.

Industry Implementation – The proposed action would require licensees to make facility modifications and to revise their

² Regulatory Analysis Technical Evaluation Handbook, Final Report, NUREG/BR-0184, Office of Nuclear Regulatory Research, January 1997.

Page 8

Regulatory Analysis of Proposed Revisions to 10 CFR Part 73

Page 13

defend against the DBT. There would also be a reduced risk that public health and occupational health will be affected by radiological releases resulting from radiological sabotage. The proposed rule would also reduce the risk that off-site and on-site property will be affected by radiological releases resulting from radiological sabotage.

The new requirements in the rule are expected to result in specific qualitative benefits listed below:

The security plan updates and revisions that would be required by the proposed rule would lead to the consistent implementation of best security practices.

Current security regulations do not contain requirements related to cyber security. The NRC issued orders after September 11, 2001, that required power reactor licensees to implement interim compensatory measures to enhance cyber security licensees. These security measures required an assessment sufficient to provide protection against the cyber threats at the time of the orders. However, as licensees implement digital upgrades for many systems at their plants the potential for cyber threats will be increased. The proposed requirements would maintain the intent of the security orders by establishing the requirement for a cyber security program to protect any systems that can, if compromised, adversely impact safety, security or emergency preparedness.

 The proposed rule would ensure that escorts are trained and knowledgeable about their duties while accompanying visitors. This proposed requirement would reduce the risk of a security incident initiated by a visitor since escorts would be better informed regarding visitor's authorized activities.

Current regulatory requirements ensure that both CAS and SAS have equivalent alarm annunciation and communication capabilities, but do not explicitly require equivalent assessment, monitoring, observation, and surveillance capabilities. Further, the current requirement of 173.55(e)(1) states "All alarms required pursuant to this part must annunciate in a continuously manned central alarm station located within the protected area and in at least one other continuously manned station not necessarily onsite, so that a single act cannot remove the capability of calling for assistance or otherwise responding to an alarm." The Commission orders added enhanced detection and assessment capabilities, but did not require equivalent capabilities for both CAS and SAS. The security plans approved by the Commission on October 29, 2004, varied, due to the performance-based nature of the requirements, with respect to how the individual licensees implemented these requirements, but all sites were required to provide CAS and SAS with functionally equivalent capabilities to support the implementation of the site protective strategy.

The proposed rule extends the requirement for no single act to remove capabilities to the key functions required of the alarm stations and would require licensees to implement protective measures such that a single act would not disable the intrusion detection, assessment, and communications capabilities of both the CAS and SAS. This proposed requirement would ensure continuity of response operations during a security event by ensuring that the detection, assessment, and communications

. . .

Regulatory Analysis of Proposed Revisions to 10 CFR Part 73

Page 14

functions required to effectively implement the licensee's protective strategy are maintained despite the loss of one or the other alarm station. For the purposes of assessing the regulatory burden of this proposed rule, the NRC assumed that all licensees would require assessments and approximately one third of the licensees would choose to implement hardware modifications.

The NRC has concluded that protecting the alarm stations such that a single act does not disable the key functions would provide an enhanced level of assurance that a licensee can maintain detection, assessment and communications capabilities required to protect the facility against the design basis threat of radiological sabotage. For new reactor licensees, licensed after the publication of this rule, the Commission would require CAS and SAS to be designed, constructed, and equipped with equivalent standards.

Current regulatory requirements require back-up power for alarm annunciation and nonportable communication equipment, but do not require uninterruptible back-up power. Although not specifically required, many licensees have installed uninterruptible power to their security systems for added reliability of these electronic systems. However, the Commission has not required uninterruptible power for assessment systems. Uninterruptible back-up power would provide an enhanced level of assurance that a licensee can maintain detection, assessment and communication capabilities required to defend the facility against the design basis threat. This new requirement would reduce the risk of losing detection, assessment, and communication capabilities during a loss of the normal power supply.

Current regulatory requirements address the use of closed circuit television systems, but do not explicitly require them. Although not specifically required, all licensees have adopted the use of video surveillance in their site security plans, and many of the licensees have adopted advanced video surveillance technology to provide real-time and play-back/recorded video images to help security officials determine the cause of an alarm annunciation. Advanced video technology would provide an enhanced level of assurance that a licensee can assess the cause of an alarm annunciation and initiate a timely response capable of defending the facility against the threat up to and including the design basis threat.

The proposed safety-security interface requirements would reduce the risk of adverse safety-security interactions. These requirements would enhance the communication among nuclear power plant staff in order to avoid adverse safety or security effects.

The proposed rule contains several new reporting provisions. It would require licensees to notify the NRC Operations Center no later than 15 minutes after discovery of an actual or imminent threat against the facility including a requirement to follow this report with a written report within 60 days. Additionally, the proposed rule would require licensees to report within 4 hours to NRC incidents of suspicious activity or tampering. These proposed requirements enable NRC to quickly obtain information that could

exercises and to mitigate any potential conflict of interest that could influence the results of force-on-force exercises. These provisions of EPAct 2005 would be incorporated into the newly proposed §§ 73.18 and 73.19, and the revision to proposed 73.55 and the newly proposed NRC Form 754 (Enclosure 2). To implement the EPAct 2005 provisions efficiently, the NRC expanded the rulemaking's scope beyond power reactors (for the EPAct 2005 provisions related to the use of enhanced weapons and firearms background checks only) to cover facilities authorized to possess formula quantities or greater of strategic special nuclear material (i.e., Category I SSNM facilities). Such facilities, and uranium enrichment facilities.

Through implementing the security orders, reviewing the revised site security plans, and evaluating force-on-force exercises, the NRC has identified some additional security measures necessary to ensure that licensees provide high assurance that public health and safety and the common defense and security are adequately protected.

Finally, Petition for Rulemaking (PRM 50-80), requested the establishment of regulations governing proposed changes to facilities which could adversely affect their protection against radiological sabotage. This petition was partially granted and the proposed new § 73.58 contains requirements to address this area.

The proposed amendments to the physical security requirements for power reactors, and for the new weapons requirements, Category I SSNM facilities, would result in changes to the following existing sections and appendices in 10 CFR Part 73:

• 10 CFR 73.2, Definitions.

Jer

• 10 CFR 73.55, Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage.

• 10 CFR 73.56, Personnel access authorization requirements for nuclear power plants.

• 10 CFR 73.71, Reporting of safeguards events.

-iii-

• 10 CFR 73, Appendix B, General criteria for security personnel.

- 10 CFR 73, Appendix C, Licensee safeguards contingency plans.
- 10 CFR 73, Appendix G, Reportable safeguards events.
 - The proposed amendments would also add three new sections to Part 73:
- Proposed § 73.18, Firearms background checks for armed security personnel.
- Proposed § 73.19, Authorization for use of enhanced weapons.
- Proposed § 73.58, Safety/security interface requirements for nuclear power reactors.
 - The proposed rule would also add a new NRC Form 754 under the proposed new

Conforming changes to the requirements listed below are proposed in order to ensure that cross-referencing between the various security regulations in Part 73 are preserved, and to avoid revising requirements for licensees who are not within the scope of this proposed rule. The following requirements contain conforming changes:

- Section 50.34, "Contents of applications; technical information" would be revised to align the application requirements with the proposed revisions to Appendix C to 10 CFR Part 73.
 - Section 50.54, "Conditions of licenses" would be revised to conform with the proposed revisions to sections in Appendix C to 10 CFR Part 73.
 - Section 50.72, "Immediate notification requirements for operating nuclear power reactors" would be revised to state (in footnote 1) that immediate notification to the NRC may be required (per the proposed § 73.71 requirements) prior to the notification requirements under the current § 50.72.

× · . .

.....

and the second second

concluded that there will be no significant radiological environmental impacts associated with implementation of the proposed rule requirements for the following reasons:

(1) The proposed revision to the Part 73 security requirements would not result in changes to the design basis requirements for the structures, systems, and components (SSCs) in the facility that function to limit the release of radiological effluents during and following postulated accidents. As a result, all the SSCs associated with limiting the releases of offsite radiological effluents would continue to be able to perform their functions, and as a result, there would be no significant radiological effluent impact. In this regard, the safety-security requirement (new section added as § 73.58) is intended to address the interface between security and safety, and the need to ensure that the potential for adverse effects on safety (due to security actions) or security (due to safety actions) are assessed and managed such that facility safety and security is maintained.

(2) The standards and requirements applicable to radiological releases and effluents would not be affected by this rulemaking and would continue to apply to the SSCs affected by this rulemaking.

The principal effect of this action would be to revise the governing regulations pertaining to security to make them more closely align with the previously imposed orders, to make changes required to implement the EPAct 2005, and to add several new requirements. The majority of these requirements stem from the security orders issued after September 11, 2001, and are already in place at power reactors. None of the proposed revisions have an impact on occupational exposures, consequently the NRC has concluded that this action would cause no impact on occupational exposure.

For the reasons discussed above, the action will not significantly increase the probability or consequences of accidents, nor result in changes being made in the types of any effluents that may be released off-site, and there would be no significant increase in occupational or public radiation exposure.

With regard to potential nonradiological impacts, implementation of the rule requirements would have no impact on the environment. The revised requirements would not affect any historic sites, would not affect nonradiological plant effluents, and would have no other environmental impact. Therefore, there would be no significant nonradiological environmental impacts associated with the action.

Accordingly, the NRC staff concludes that there would be no significant environmental impacts associated with the action.

Alternatives to the Proposed Action:

As an alternative to the rulemakings described above, the NRC staff considered not taking the action (i.e., the "no-action" alternative). Not revising the security regulations would result in no change in current environmental impacts since the proposed requirements have no environmental impact and taking no action therefore results in no net change to the environment. However, the no action alternative would leave the governing security regulations as they are, and the regulation would not reflect the actual requirements governing security. In addition, not taking action would cause the NRC to not be responsive to the EPAct 2005. The NRC staff concluded that leaving the governing security regulations unaligned with order requirements is not a desirable regulatory practice . The Commission has directed the staff to revise the regulations in a Staff Requirements Memorandum dated August 23, 2004. Finally, the no action alternative would not be implement the requirements in the EPAct 2005.

Commissioner Merrifield's Comments on SECY-06-0126

Proposed Rulemaking - Power Reactor Security Requirements

I approve the staff recommendation to publish the proposed amendments to 10 CFR Parts 50, 72, and 73, and appendices, in the Federal Register for public comment, subject to the attached edits. This comprehensive rulemaking will codify the requirements imposed on nuclear power plant licensees through Commission Orders, and bring closure to the significant nuclear power plant security issues raised by the terrorist attacks of September 11, 2001. In addition, the proposed rule incorporates provisions that Congress enacted through the 2005 Energy Policy Act legislation.

While I am not enamored of rule packages on the order of one thousand pages, I believe in this case the volume is justified. The associated tables included in this rule package provide section-by-section explanations of the proposed changes that offer stakeholders without security clearances a chance to understand how the staff arrived at the proposed changes in a way that does not compromise common defense and security. I commend the staff for discussing the proposed changes in an open manner that allows meaningful public comment on security requirements at nuclear power plants.

I note the staff plans to conduct a public meeting during the public comment period. This is a good first step, but based on the sheer volume of issues being addressed, more than one public meeting may be needed to ensure that the staff provides stakeholders a chance to understand the reasoning behind the proposed changes. Recent experience with other voluminous rule packages leads me to believe that perhaps a second, or even a third, public meeting may necessary to fully vet the issues addressed in this proposed rule.

Table 4 - Proposed Part 73 Section 73.58

PROPOSED LANGUAGE	CONSIDERATIONS
	The Commission has determined that the proposed safety/security rule requirements are necessary for public health and safety, and reasonable assurance that the common defense and
	security continue to be adequately protected because the current regulations do not specifically require evaluation of
•	the effects of plant changes on security or the effects of security plan changes on plant safety. Further, the regulations do not require communication about the
· · · ·	implementation and timing of changes, which would promote awareness of the effects of changing conditions,
	and result in appropriate assessment and response.

Safety/security interface.

 \mathbb{D}

Commissioner Jaczko's Comments on SECY-06-0126 Proposed Rulemaking - Power Reactor Security Requirements

I approve of the staff's proposal to publish the proposed rule for public comment and complete the rulemaking within a schedule of one year. This rulemaking, which in large part codifies and improves the many of the elements of security orders imposed on power reactor licensees since September 11, 2001 and implements certain provisions of the Energy Policy Act of 2005, is very important step toward addressing security concerns following September 11 and preparing for potential new reactor licensing. I commend Chairman Diaz, Commissioner McGaffigan, Commissioner Merrifield for their leadership on the post-September 11 security work and the staff for their commitment to preparing such a comprehensive and ever-changing proposal on such a tight schedule.

Despite the importance of this proposed rule, I do not view this rulemaking by itself as the most important security rulemaking in process. This rulemaking is one of three security rulemakings focused on the security of power reactors the Commission is working on. The others are the on-going rulemaking on the design basis threat and the planned rulemaking on security assessments for new reactor designs

Most of the requirements set forth in this rulemaking are already in place as a result of the various security orders issued since September 11, 2001, and this rule change will primarily add stability and finality to that process. What remains undone, however, is an important rulemaking to require applicants for combined operating licenses of new reactors to design security features into their future facilities.

Today's regulatory framework, embodied in this rulemaking and imposed by the post-September 11 security orders, relies heavily on maintaining a physical security program to protect vital areas of a plant and on mitigating strategies to ameliorate the effects of losses of large areas of the facility of due to fires and explosions. It is imperative that future designs become inherently safer and more secure through design features that reduce the need for physical security programs, potentially reducing the number of needed armed responders, and through design features that prevent the loss of safety systems and functions, eliminating the need for mitigating strategies. The security assessment rulemaking needs to address these important issues. Completing this rulemakings in a timely manner will be crucial to finalizing a robust regulatory framework for existing reactors and potential new reactors.

As the Advisory Committee on Reactor Safeguards recently stated in an April 24, 2006 letter on the review of ongoing security-related activities,

"A variety of potential mitigation strategies have been identified for existing plants. The degree to which the risk due to security events can be reduced for existing plants is severely constrained by the cost of modifications in an existing plant. However, if incorporated into the design before construction and licensing, the cost of reducing the risk due to security events can be substantially reduced. The pilot studies performed for existing plants should be extended to examine the potential for increasing the robustness of new plants for security events and for including security considerations in the design certification process. Criteria for enhanced plant protection against security events at new reactors should be developed on a priority basis." With regard to the current rulemaking, there are three important issues that I believe the staff should solicit comment on.

First, the staff should solicit comment on the need to establish a regulatory requirement to maintain communication protocols with the Nuclear Regulatory Commission in order to verify the authenticity of communications in a security event. The current rule establishes new reporting requirements for security-based events. The staff should solicit comments on whether these new requirements should include requirements for uniform _protocols to verify the authenticity of reports under this new provision.

Second, the staff should expand on and solicit comment on the appropriate framework for the insider mitigation program requirements. I support amending the proposed rule prior to publication with the proposed language and structure presented to Commissioner McGaffigan and other Commissioner assistants on June 27, 2006.

Third, the staff should solicit comment on the need to establish performance-based security requirements for the transmission of vital plant information using the Emergency Response Data System (ERDS). ERDS is a crucial element of the NRC's incident response system in traditional accidents. Ensuring this important source of information can be transmitted during a security incident or even during a natural disaster will improve the NRC's ability to provide effective oversight of any emergency situation. Specifically, the staff should seek comment on using new technology that will both improve the performance of ERDS and improve the security of the system.

Lastly the staff should strive, to the extent possible, to make as much of the implementing guidance for all of these requirements publically available in order that all stakeholders can understand the requirements to which we hold our licensees in security. Making these requirements and the implementing guidance available to our stakeholders will go a long way toward instilling confidence that the NRC has required a much greater degree of security in a post-September 11, 2001 environment and will allow greater participation by stakeholders in the licensing process.

Commissioner Lyons' Comments on SECY-06-0126

I approve publishing in the *Federal Register* the proposed amendments to 10 CFR Parts 50, 72 and 73 with appendices. I approve certifying that this rule, if promulgated, will not have a negative economic impact on a substantial number of small entities in order to satisfy the requirements of the Regulatory Flexibility Act. The Order requirements addressed in the final rule should not be rescinded, but should be dispositioned as having been satisfied, if applicable, in individual cases.

I would like to highlight one matter that I wish to have clarified through this rulemaking regarding escorted access for members of the public visiting nuclear power reactors. In Europe, I have noticed that members of the public tour nuclear facilities and attend informational briefings at the facilities that enhance public education and awareness. I support these measures, and I would like to see more effort on the part of industry and the government to encourage the public to visit US nuclear power facilities and other US fuel cycle facilities. Therefore, this rulemaking should request public comment on the feasibility of a modified escorted access provision to selected areas of the facility for members of the public in order to facilitate this goal.

In addition, I have included edits to the rulemaking package, as attached hereto.

8/06

NRC Form 754) to the list of sections and forms with Office of Management of Management Budget (OMB) information collection requirements. A corrective revision to § 73.8 would also be made to reflect OMB approval of existing information collection requirements for NRC Form 366 under existing § 73.71.
Section 73.70, "Records" would be revised to reference the appropriate revised paragraph numbers in proposed § 73.55 regarding the need to retain a record of the registry of visitors.

Additionally, § 73.81(b), "Criminal penalties" which sets forth the sections within Part 73 that are not subject to criminal sanctions under the AEA, would remain unchanged since willful violations of the newly proposed §§ 73.18, 73.19, and 73.58 may be subject to criminal sanctions.

Appendix B and Appendix C to Part 73 require special treatment in this rulemaking to preserve, with a minimum of conforming changes, the current requirements for licensees and applicants to whom this proposed rule would not apply. Accordingly, section I through V of Appendix B would remain unchanged, and the proposed new language for power reactors would be added as section VI. Appendix C would be divided into two sections, with Section I maintaining all current requirements, and Section II containing all proposed requirements related to power reactors.

set a set of the set o

On July 19, 2004, NRC staff issued a memorandum entitled "Status of Security-Related Rulemaking" (accession number ML041180532) to inform the Commission of plans to close former security-related actions and replace them with a comprehensive rulemaking plan to modify physical protection requirements for power reactors. This memorandum described rulemaking efforts that were suspended by the terrorist activities of September 11, 2001, and

Safety/Security interface requirements. These requirements are located in proposed § 73.58. The safety/security requirements are intended to explicitly require licensee coordination of potential adverse interactions between security activities and other plant activities that could compromise either plant security or plant safety. The proposed requirements would direct licensees to assess and manage these interactions so that neither safety nor security is compromised. t These proposed requirements address, in part, a Petition for Rulemaking (PRM 50-80) that requested the establishment of regulations governing proposed changes to the facilities which could adversely affect the protection against radiological sabotage.

2.

12.

. .

EPAct 2005 additional requirements. The EPAct 2005 requirements that would 3. be implemented by this proposed rulemaking, in addition to the weapons-related additions described above, consist of new requirements to perform force-onforce exercises, and to mitigate potential conflicts of interest that could influence conducted the results of NRC-observed force-on-force exercises. These proposed new requirements would be included in proposed § 73.55 and Appendix C to Part 73.

Accelerated notification and revised four-hour reporting requirements. This 4. proposed rule contains accelerated security notification requirements (i.e., within 15 minutes) in proposed § 73.71 and Appendix G to Part 73 for attacks and imminent threats to power reactors. The proposed accelerated notification requirements are similar to what was provided to the industry in NRC Bulletin 2005-02, "Emergency Preparedness and Response Actions for Security-Based Events," dated July 18, 2005. The proposed rule also contains two new four18 years for unarmed responders, qualification scores for testing required by the training and qualification plan, qualification requirements for security trainers, qualification requirements of personnel assessing psychological qualifications, armorer certification requirements, and program requirements for on-the-job training.

10. <u>Security Program Implementation insights</u>. The proposed rule would impose new enhancements identified from implementation of the security orders, review of site security plans, and implementation of the enhanced baseline inspection program and force-on-force exercises. These new requirements would include changes to specifically require that the central alarm station (CAS) and

er en ser er

2 - 1 P

secondary alarm station (SAS) have functionally equivalent capabilities such that no single act can disable the function of both CAS and SAS. The proposed additions would also include requirements for new reactor licensees to position the SAS within the protected area, add bullet resistance and limit the visibility into SAS. Proposed additions also require uninterruptible backup power supplies for detection and assessment equipment, "video-capture" capability, and qualification requirements for drill and exercise controllers.

of prosters. El terre

11. <u>Miscellaneous</u>. The proposed rule would eliminate some requirements that the staff found to be unnecessary to ensure high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety such as to be eliminated provides.
The requirement for guards to escort operators of motor vehicles within the protected area if the operators are cleared for unescorted access. The proposed

equivalent capabilities for both CAS and SAS. The security plans approved by the Commission on October 29, 2004, varied, due to the performance-based nature of the requirements, with respect to how the individual licensees implemented these requirements, but all sites were required to provide a CAS and SAS with functionally equivalent capabilities to support the implementation of the site protective strategy.

The proposed rule extends the requirement for no single act to remove capabilities to the key functions required of the alarm stations and would require licensees to implement protective measures such that a single act would not disable the intrusion detection, assessment, and communications capabilities of both the CAS and SAS. This proposed requirement would ensure continuity of response operations during a security event by ensuring that the detection, assessment, and communications functions required to effectively implement the licensee's protective strategy are maintained despite the loss of one or the other alarm station. For the purposes of assessing the regulatory burden of this proposed rule, the NRC assumed that all licensees would require assessments and approximately one third of the licensees would choose to implement hardware modifications.

The NRC has concluded that protecting the alarm stations such that a single act does not disable the key functions would provide an enhanced level of assurance that a licensee can maintain detection, assessment and communications capabilities required to protect the facility against the design basis threat of radiological sabotage. For new reactor licensees, licensed after the publication of this rule, the Commission would require CAS and SAS to be designed, constructed, and equipped with equivalent standards.

Uninterruptible Power for Intrusion Detection and Assessment Systems

Current regulatory requirements require back-up power for alarm annunciation and nonportable communication equipment, but do not require this back-up power to be uninterruptible. Although not specifically required, many licensees have installed uninterruptible power to their

response capabilities. Historically digital computer systems have played a limited role in the operation of nuclear power plants. However, the role of computer systems at nuclear power plants is increasing, as licensees take advantage of computer technology to maximize plant productivity. In general, licensees currently exclude from their access authorization programs, individuals who may electronically access equipment in the protected areas of nuclear power plants to perform their job functions, if their duties and responsibilities do not require physical unescorted access to the equipment located within protected or vital areas. However, because these individuals manage and maintain the networks that connect to equipment located within protected or vital areas and are responsible for permitting authorized and/or trusted personnel to gain electronic access to equipment and systems, they are often granted greater electronic privileges than the trusted and authorized personnel. With advancements in electronic technology and telecommunications, differences in the potential adverse impacts of a saboteur's actions through physical access and electronic access are lessening. Thus, the proposed rule would require those individuals who have authority to electronically access equipment that, if compromised can adversely impact operational safety, security or emergency preparedness of the nuclear power plants, to be determined to be trustworthy and reliable.

The proposed revisions to § 73.56 would also address changes in the nuclear industry's structure and business practices since this rule was originally promulgated. At the time the current § 73.56 was developed, personnel transfers between licensees (i.é., leaving the employment of one licensee to work for another licensee) with interruptions in unescorted access authorization were less common. Most licensees operated plants at a single site and maintained an access authorization program that applied only to that site. When an individual left employment at one site and began working for another licensee, the individual was subject to a different access authorization program that often had different requirements. Because some licensees were reluctant to share information about previous employees with the new

would be specified in proposed § 73.56(m) [Protection of information]. As a result, individuals who are subject to this section would establish a detailed "track record" within the industry that would potentially cover their activities over long periods of time and would follow them if they change jobs and move to a new position that requires them to be granted unescorted access authorization by another licensee. The proposed requirement acknowledges the industry initiative to develop and utilize a database to ensure accurate information sharing between sites. This increased information sharing is necessary to provide high assurance that individuals who are granted and maintain unescorted access authorization are trustworthy and reliable when individuals move between access authorization programs. In addition, the increased information sharing would reduce regulatory burden on licensees when processing individuals who have had only short breaks between periods of unescorted access authorization.

Another change in the NRC's proposed approach to access authorization requirements is the result of a series of public meetings that were held with stakeholders during 2001–2004 to discuss potential revisions to 10 CFR Part, 26, "Fitness-for-Duty Programs." Part 26 establishes additional steps that the licensees who are subject to § 73.56 must take as part of the process of determining whether to grant unescorted access authorization to an individual or permit an individual to maintain unescorted access authorization. These additional requirements focus on aspects of an individual's behavior, character, and reputation related to substance abuse, and, among other steps) require the licensee and other entities who are subject to Part 26 to conduct drug and alcohol testing of individuals and an inquiry into the individual's past behavior with respect to illegal drug use or consumption of alcohol to excess, as part of determining whether the individual may be granted unescorted access authorization. However, historically there have been some inconsistencies and redundancies between the § 73.56 access authorization requirements and the related requirements in Part 26. These

notifications, the NRC may request the licensee establish a continuous communications channel after the licensee has made any emergency notifications to State officials or local law enforcement and if the licensee has taken action to stabilize the plant following any transient [associated with the 15-minute notification]. In NRC Bulletin 2005-02, "Emergency Preparedness and Response Actions for Security-Based Events," dated July 18, 2005, the NRC had indicated a continuous communications channel was not necessary for the new 15-minute notifications. However, in developing this proposed rule the Commission has evaluated the need to promptly obtain information of an unfolding event versus imposing an unreasonable burden on licensees in the midst of a rapidly unfolding event and possible plant transient. The Commission considers that the proposed regulation would provide a reasonable balance between these two objectives. Table 5 sets forth the proposed amendments to § 73.71 language as compared to the current language, and provides the supporting discussion for the proposed language. Table 8 sets forth the proposed amendments to the Appendix G language as compared to the current language, and provides the supporting discussion for the proposed language. الالا الاخترافي الرواب المراجع

The Commission is interested in obtaining specific stakeholder input on the proposed changes to § 73.71 and Appendix G. Accordingly, the Commission is requesting persons commenting on this proposed rule to address the following question:

 For the types of events covered by the proposed four-hour notification requirements in § 73.71 and Appendix G, should the notification time interval of all or some of these notifications be different (e.g., a 1-hour, 2-hour, 8-hour,

24-hour notification)? If so, what notification time interval is appropriate?

IV.6. Appendix B to Part 73, "General Criteria For Security Personnel." +i m

wha

Table 11 (See Section VIII) is a cross-reference showing where individual requirements of the current regulation would be in the proposed regulation.

IV.8. Appendix G to Part 73, "Reportable Safeguards Events."

Proposed Appendix G to Part 73 provides requirements regarding the reporting of safeguards events. Proposed Appendix G would contain changes to support the revised and accelerated reporting requirements which would be incorporated into this rulemaking. Proposed Appendix G would also contain revised four-hour reporting requirements that would require licensees to report to the NRC information of suspicious surveillance activities, attempts at access, or other information. Following September 11, 2001, the NRC issued guidance requesting that licensees report suspicious activities near their facilities to allow assessment by the NRC and other appropriate agencies. The proposed new reporting requirement will clarify this expectation to assure consistent reporting of this important information. Additionally, the proposed rule contains an additional four-hour reporting requirements. The proposed reporting requirements for tampering events will allow NRC assessment of these events. Table 8 sets forth the proposed amendments to Appendix G and provides the supporting discussion for the proposed language.

IV.9 Conforming and Corrective Changes.

The following conforming changes would also be made: §§ 50.34 and 50.54 (references to the correct paragraphs of revised Appendix C of Part 73), § 50.72 (changes to § 73.71 reports), §§ 72.212 and 73.70 (references to the correct paragraphs due to renumbering of § 73.55), and § 73.8 (adding § 73.18, § 73.19, and revised to reflect new NRC form 754 to

Table 1 - Proposed Sections 73.18 and 73.19

(ii) Storage of spent fuel must be within a protected area, in accordance with § 73.55(e) of this chapter, but need not be within a separate vital area. Existing protected areas may be expanded or new protected areas added for the purpose of storage of spent fuel in accordance with this general license.

(iii) For purposes of this general license, personnel searches required by § 73.55(h) of this chapter before admission to a new protected area may be performed by physical pat-down searches of persons in lieu of firearms and explosives detection equipment.

(iv) The observational capability required by § 73.55(i)(7) of this chapter as applied to a new protected area may be provided by a guard or watchman on patrol in lieu of closed circuit television.

(v) For the purpose of this general license, the licensee is exempt from §§ 73.55(k)(2) and 73.55(k)(7)(ii) of this chapter.

PART 73 - PHYSICAL PROTECTION OF PLANTS AND MATERIALS

7. The authority citation for Part 73 is revised to read as follows:

capable of facilitating timely evaluation of the detected unauthorized activities before completed penetration of the protected area perimeter barrier.

(ii) Assessment equipment in the isolation zone must provide real-time and playback/recorded video images in a manner that allows timely evaluation of the detected unauthorized activities before and after each alarm annunciation.

(iii) Parking facilities, storage areas, or other obstructions that could provide concealment or otherwise interfere with the licensee's capability to meet the requirements of paragraphs (e)(5)(i)(A) and (B) of this section, must be located outside of the isolation zone.

and the second

(6) Protected Area.

and the state of the second second

1997 - 199**1** - 1997

(i) The protected area perimeter must be protected by physical barriers designed and constructed to meet Commission requirements and all penetrations through this barrier must be secured in a manner that prevents or delays, and detects the exploitation of any penetration.

(ii) The protected area perimeter physical barriers must be separated from any other barrier designated as a vital area physical barrier, unless otherwise identified in the approved physical security plan.

(iii) All emergency exits in the protected area must be secured by locking devices that allow exit only, and alarmed.

the central alarm station, must be provided protection equivalent to vital equipment and located within a vital area.

(iv) Vital equipment that is undergoing maintenance or is out of service, or any other change to site conditions that could adversely affect plant safety or security, must be identified in accordance with § 73.58, and adjustments must be made to the site protective strategy, site procedures, and approved security plans, as necessary.

and the state of the second second

(v) The licensee shall protect all vital areas, vital area access portals, and vital area emergency exits with intrusion detection equipment and locking devices. Emergency exit locking devices shall be designed to permit exit only.

(vi) Unoccupied vital areas must be locked.

(8) Vehicle Barrier System. The licensee must:

(i) Prevent unauthorized vehicle access or proximity to any area from which any vehicle, its personnel, or its contents could disable the personnel, equipment, or systems necessary to meet the performance objective and requirements described in paragraph (b).

(ii) Limit and control all vehicle approach routes.

and the second secon

(iii) Design and install a vehicle barrier system, to include passive and active barriers, at a stand-off distance adequate to protect personnel, equipment, and systems against the design basis threat.

(C) Implement compensatory measures upon discovery or suspicion that any access control device may have been compromised. Compensatory measures must remain in effect until the compromise is corrected.

(D) Retrieve, change, rotate, deactivate, or otherwise disable access control devices that have been, or may have been compromised.

(E) Retrieve, change, rotate, deactivate, or otherwise disable all access control devices issued to individuals who no longer require unescorted access to the areas for which the devices were designed.

(7) Visitors.

(i) The licensee may permit escorted access to the protected area to individuals who do not have unescorted access authorization in accordance with the requirements of § 73.56 and part 26 of this chapter. The licensee shall:

المراجعة المشتمسة مراجعة فالمسود والالمان المتحال المتحد والمراجع والمراجع والمراجع والمراجع المراجع المراجع

(A) Implement procedures for processing, escorting, and controlling visitors.

(B) Confirm the identity of each visitor through physical presentation of an identification card issued by a recognized local, state, or Federal Government agency that includes a photo or contains physical characteristics of the individual requesting escorted access.

896

and the second second

. .

(7) Vehicle search checkpoints must be equipped with video surveillance equipment that must be monitored by an individual capable of initiating and directing a timely response to unauthorized activity.

(8) Exceptions to the search requirements of this section must be identified in the approved security plans.

(i) Vehicles and items that may be excepted from the search requirements of this $\mathcal{M} \cup S + b \in \mathcal{M}$ section must be escorted by an armed individual who is trained and equipped to observe offloading and perform search activities at the final destination within the protected area.

(ii) To the extent practicable, items excepted from search must be off loaded only at specified receiving areas that are not adjacent to a vital area.

(iii) The excepted items must be searched at the receiving area and opened at the final destination by an individual familiar with the items.

(i) Detection and Assessment Systems.

(1) The licensee shall establish and maintain an intrusion detection and assessment system that must provide, at all times, the capability for early detection and assessment of unauthorized persons and activities.

(2) Intrusion detection equipment must annunciate, and video assessment equipment images shall display, concurrently in at least two continuously staffed onsite alarm stations, at

(iii) The licensee shall conduct random patrols of areas containing unirradiated MOX fuel assemblies to ensure the integrity of barriers and locks, deter unauthorized activities, and to identify indications of tampering.

(iv) Locks, keys, and any other access control device used to secure equipment and power sources required for the movement of unirradiated MOX fuel assemblies or openings to areas containing unirradiated MOX fuel assemblies must be controlled by the security organization.

(c) General performance objective. Access authorization programs must provide high assurance that the individuals who are specified in paragraph (b)(1), and, if applicable, (b)(2) of such fhat f(e) this section are trustworthy and reliable, and do not constitute an unreasonable risk to public health and safety or the common defense and security, including the potential to commit radiological sabotage.

(d) Background investigation. In order to grant unescorted access authorization to an individual, the licensees, applicants, and C/Vs specified in paragraph (a) of this section shall ensure that the individual has been subject to a background investigation. The background investigation must include, but is not limited to, the following elements:

(f) Behavioral observation. Access authorization programs must include a behavioral observation element that is designed to detect behaviors or activities that may constitute an unreasonable risk to the health and safety of the public and common defense and security, including a potential threat to commit radiological sabotage.

(1) The licensees, applicants, and C/Vs specified in paragraph (a) of this section shall ensure that the individuals specified in paragraph (b)(1) and, if applicable, (b)(2) are subject to behavioral observation.

VI. Nuclear Power Reactor Training and Qualification Plan.

A. General requirements and introduction.

1. The licensee shall ensure that all individuals who are assigned duties and responsibilities required to prevent significant core damage and spent fuel sabotage, implement the Commission approved security plans, licensee response strategy, and implementing procedures, meet minimum training and qualification requirements to ensure each individual possess the knowledge, skills, and abilities required to effectively perform the assigned duties and responsibilities.

 $\frac{1}{2} = \frac{1}{2} \left[\frac{1}{2} \left[$

2. To ensure that those individuals who are assigned to perform duties and responsibilities required for the implementation of the Commission approved security plans, licensee response strategy, and implementing procedures are properly suited, trained, equipped, and qualified to perform their assigned duties and responsibilities, the Commission has developed minimum training and qualification requirements that must be implemented through a Commission approved training and qualification plan.

3. The licensee shall establish, maintain, and follow a Commission approved training and qualification plan, describing how the minimum training and qualification requirements set forth in this appendix will be met, to include the processes by which all members of the security organization, will be selected, trained, equipped, tested, and qualified.

4. Each individual assigned to perform security program duties and responsibilities required to effectively implement the Commission approved security plans, licensee protective
