Stephen Cohen:

The following is another image taken today of the organic seep in the North wall of the excavation:

A cellular telephone was included for scale.

The image below is of perched fluid around the bottom of monitor well TMW-90 in the excavation floor:

The fluid is barely visible at the base of the boulder. A collection sump will be excavated around TMW-90 to collect any fluid, which will be pumped to the tailings impoundment. The elevation of the excavation floor is approximately 6600 feet above mean sea level.

The fluid and the seep were sampled this afternoon.
