X Main Office Inspection		Next Inspection Date:	7/2007	
X Temporary Job Site	Fenton, Missouri			

PROGRAM SCOPE

The licensee operates an industrial radiograph program which has authorization for temporary job sites within NRC jurisdiction. The main facility was inspected as well as a temporary job site in Fenton, Missouri. The licensee has five radiographers and three assistant radiographers. The licensee had eight 660B camera's authorized to contain no more than 140 curies of Ir-192. The licensee does not conduct source changes.

Performance Observations

During the inspection, the inspector interviewed the authorized users, licensee's management, and radiation safety officer and found that they were knowledgeable regarding their responsibilities under the license. The licensee's staff demonstrated a typical radiographic exposure utilizing a Amersham model 660B exposure device containing a nominal 14 curie iridium-192 source at a temporary job site, Fenton, Missouri. The inspector conducted independent measurements that indicated similar results were noted by the licensee in their surveys. The inspector conducted side-by-side comparison radiation surveys between NRC and licensee radiation detection equipment; the inspector did not identify any significant variation between the two instruments. The inspector reviewed the licensee's dosimetry records and determined that no exposures exceeded NRC's limits. The inspector determined that shipping papers were completed and being used in accordance with NRC/DOT requirements. The inspector determined that the licensee was performing the appropriate audits of its radiographer's and radiation safety program as required. The inspector noted that licensed material was secured in accordance with NRC requirements.
