Kymn,

We contacted the source you had provided and he is not claiming that any requirement has been, or is about to be, violated.

We found an item in their corrective action system that seems to match the technical issue. It involves monitoring a point in the feed system, and is supported by engineering evaluations that show the pipe is projected to meet all requirements through this operating cycle. For our own edification we expect to have an NRC specialist look at the analysis, but we would not handle this as an "allegation," since our source has not alleged any violation or safety problem.

If there's another source or a reason to think differently about this issue, please let us know.
