50.59 REVIEW COVERSHEET FORM

Station/Unit(s): ____Oyster Creek Unit 1

Activity/Document Number: _____ECR 06-00879

Revision Number: <u>0</u>

Title: Drywell Floor/Trough/Drainage Inspection and Repairs

NOTE: For 50.59 Evaluations, information on this form will provide the basis for preparing the biennial summary report submitted to the NRC in accordance with the requirements of 10 CFR 50.59(d)(2).

Description of Activity:

(Provide a brief, concise description of what the proposed activity involves.)

ECR 06-00879 specifies repairs to the lower drywell elevation. The joint at the perimeter of the concrete floor slab is caulked to the steel shell of the drywell. Degraded concrete around the pipes to and from the drain trough is repaired with grout. The existing trench into the concrete slab, in bay 5, is excavate slightly deeper. The degraded concrete surface of the raised slab in the sub-pile room is accepted as-is. The non-uniform slope of the sub-pile room drain trough is also accepted as-is.

Reason for Activity:

(Discuss why the proposed activity is being performed.)

Water was found in one of the 2 trenches in the drywell concrete floor slab. Extensive study (ref. A2152754 E05) was performed to evaluate the potential causes and effects. ECR 06-00879 was created to implement repairs to limit the amount of water that would bypass the intended drainage path and enter the floor slab crevices.

Effect of Activity:

(Discuss how the activity impacts plant operations, design bases, or safety analyses described in the UFSAR.)

The specified repairs do not impact plant operations or operability. There is no deviation from any described system function, method of operation, design basis or safety analysis described in the UFSAR. The repairs will help to ensure that the drywell drainage paths function as originally intended and designed.

Summary of Conclusion for the Activity's 50.59 Review:

(Provide justification for the conclusion, including sufficient detail to recognize and understand the essential arguments leading to the conclusion. Provide more than a simple statement that a 50.59 Screening, 50.59 Evaluation, or a License Amendment Request, as applicable, is not required.)

A 50.59 screening was prepared, and all five questions are answered "no". The repairs do not invalidate any stated or implied conditions of the UFSAR regarding plant SSC condition, operation or reason for acceptance, but rather serve to restore the intended design function of the drywell drainage system. Based on the assessment and screening responses, a 50.59 evaluation is not required, and the activity can proceed without prior NRC approval.

Attachments:

Attach all 50.59 Review forms completed, as appropriate. (NOTE: if both a Screening and Evaluation are completed, no Screening No. is required.)

Expanded Responses:

 $\left< \right>$

1. Does the proposed Activity involve a change to an SSC that adversely affects an UFSAR described design function?

No. The UFSAR contains extensive discussion on the concrete outside of, and beneath, the steel drywell shell, including the gap between the two. That is because that concrete provides important shielding and support functions, and the gap is essential to these functions. However, there is very little mention of the concrete floor slab inside of the drywell. Section.3.8,3.1.1, "Fill Slab", states that the concrete provides a working surface and transfers the loads of the drywell internal structures to the shell through direct bearing. Design functions of the fill slab are not impacted by the repairs performed under ECR 06-00879. The caulk installation serves to prevent water from entering any gaps between the slab and shell, and has no impact on the load transfer or support functions. Inspection of the caulk will be performed every four years under the structural monitoring program to ensure that it does not degrade.

The drywell sump's purpose is to collect all leakage in the drywell so that it can be monitored and quantified, as well as appropriately discharged. The trough and its supply and discharge paths direct the drains to the sump. The concrete repairs specified serve to restore the full capability of these functions by preventing any unintended diversion of the drains. The conditions of the raised floor slab section and the trough slope were determined to have no impact on the drainage function or the structural function of the concrete. This activity will leave the two trenches empty. This empty space may slightly delay the measurement of unidentified leak rate, which is measured by the 1-8 sump. The open trenches may collect unidentified leakage and temporarily prevent the leakage from reaching 1-8 sump. This delay has been evaluated in the ECR attachment 1 and is concluded to be minor. Tech. Spec. 3.3.D.1 requires that reactor coolant ' shall be limited to a 2 gpm increase in a 24 hour period. Assuming a 2 gpm leak were to instantaneously develop and leak into both trenches at the same time, it would take about 30 minutes for the trenches to fill and overflow at which point the leakage would enter the 1-8 sump. In addition the Tech Spec, requires that reactor coolant shall be limited to 5 gpm. Increases over 5 gpm over a short time frame are bounded by the tech spec requirement for the 2 gpm increase over a 24 hour period. Assuming a 5 gpm leak were to instantaneously develop and leak into both trenches at the same time, it would take about 12 minutes for the trenches to fill and overflow at which point the leakage would enter the 1-8 sump.

The torus suction strainers serve the function of preventing debris from damaging the ECCS pumps. The UFSAR section 6.3.2.2.3 describes the design analysis which ensures that excessive debris is not created such that the suction strainers could become too clogged by debris to allow sufficient flow to the pumps. That analysis was reviewed. The result of the materials (that could generate clogging debris) added and removed from the drywell by the subject ECR is a net reduction in these materials. Therefore there is no adverse effect on the analysis.

The 1986 removal of concrete from the floor and curb, that formed the trenches in Bay 5 and 17, does not affect any safety related design functions. A review of the Design Basis Accidents documented in chapter 15 of the UFSAR shows that the floor and curb are not credited for mitigation of design accidents. In addition it does not adversely affect the design inputs, assumptions or conclusions of the GE Design Bases Analysis of the Drywell Vessel (reference GE Report "An ASME Section VIII Evaluation of Oyster Creek Drywell for Without Sand Case Part I Stress Analysis - Index 9.3" dated Feb 1991). The effects of the missing curb will not have a significant effect on the Design Basis Accident Analysis of the Containment Shell as discussed in attachment 1 section 4.1.9 of the ECR.

The curb feature (which is unique to Oyster Creek) has been credited in some Severe Accident Mitigation Events. However the overall benefit of the curb is marginal. The PRA implications of the curb removal were not specifically addressed at the time the PRA was developed, which was after-1986. IR 550022 has been issued to address this omission. An initial review has been completed and the results demonstrate a less than significant impact on LERF and no impact on CDF.

The minor amount of concrete removed from the existing trench in bay 5 is in an area where it also has no impact on these functions.

Therefore the scope of ECR 06-00879 does not adversely affect any design function that is described, implied or referred to in the UFSAR.

Activity/Document Number: ECR 06-00879

Revision Number: ___0_

2. Does the proposed Activity involve a change to a procedure that adversely affects how UFSAR described SSC design functions are performed or controlled?

No. All of the changes made by the subject ECR are passive in nature, and do not affect the performance or control of any plant operations or evolutions. The repairs do not impact operation of the drywell sump, drywell structures or equipment or ECCS systems. No plant processes or procedures are affected by the changes. Therefore the scope of ECR 06-00879 does not adversely affect the performance or control of any UFSAR described design function.

3. Does the proposed Activity involve an adverse change to an element of a UFSAR described evaluation methodology, or use of an alternative evaluation methodology, that is used in establishing the design bases or used in the safety analyses?

No. The design analysis for suction strainer clogging described in the UFSAR was reviewed with regard to the materials added by the subject ECR. The net change in debris generating materials was evaluated using the existing methodology of the design analysis to establish its acceptability. There are no other evaluation methodologies involved with this activity. Therefore the evaluation methodology used within ECR 06-00879 does not deviate from those described in the UFSAR.

4. Does the proposed Activity involve a test or experiment not described in the UFSAR, where an SSC is utilized or controlled in a manner that is outside the reference bounds of the design for that SSC or is inconsistent with analyses or descriptions in the UFSAR?

No. The purpose of the repairs is to direct drywell drains to the sump, as described in the UFSAR. The caulk and grout serve to restore this function. The addition of the materials has been evaluated in accordance with existing analyses and processes, and was found to be acceptable. The scope of ECR 06-00879 does not affect the use or control of any plant SSC. Therefore this activity does not involve any test or experiment that is not bounded by the UFSAR.

5. Does the proposed Activity require a change in the Technical Specifications or Operating License?

No. The repairs in ECR 06-00879 are passive in nature and do not affect the operational parameters or operability of any plant SSC. Additionally, none of the required actions or limits for operation of the Technical Specification or Operating License are impacted by the repairs. Therefore no changes are required to the Technical Specifications or Operating License.

DESIGN ATTRIBUTES (Numbers correspond to CC-AA-102 rev 13, Att. 1 list items)

4.1.4.1 IDENTIFY BASIC SSC FUNCTIONS:

a.

The Containment is an enclosure for the reactor vessel, the Reactor Coolant Recirculation System, and other branch connections of the Reactor Coolant System. Per UFSAR section 6.2.1, the design criteria for the Containment are as follows:

- To withstand the peak transient pressure (coincident with an earthquake) which could occur due to the postulated break of any pipe inside the drywell.
- b. To channel the flows from postulated pipe breaks to the torus.
- c. To withstand the force caused by the impingement of the fluid from a break in the largest local pipe or connection, without containment failure.
- d. To limit primary containment leakage rate during and following a postulated break in the primary system to substantially less than that which would result in offsite doses approaching the limiting values in 10CFR100.
- e. To include provisions for leak rate tests.

The concrete floor slab at the base of the drywell provides a foundation for the RPV support pedestal, as well as a level support surface for personnel and equipment. The slab internal to the pedestal has an additional 6"slab on top, and is therefore at a higher elevation than the slab outboard of the pedestal, with the exception of the 6" wide trough just inboard of the pedestal. Drains external to the pedestal can reach the trough (and sump) via four pipes in the base of the pedestal that connect the inboard and outboard areas. The higher slab inside of the pedestal is sloped downward from the center to shed water to the trough.

4.1.4.2 IDENTIFY SAFETY CLASSIFICATION OF CONFIGURATION CHANGE:

The structural support function of the concrete slab is safety related, in that it provides structural integrity for the reactor vessel and its supporting equipment. The steel drywell containment vessel is also safety related, providing the containment integrity. The concrete slab is not required to be impregnable to water, as justified in tech eval A2152754 E06*. Therefore any coatings and caulks are not safety related, and only provide the desired effect of minimizing water infiltration into the concrete/steel shell interface. This ECR is classified as safety related, however, because the added materials come into contact with the safety related steel and concrete, and could potentially have an adverse effect on them. Accordingly, the caulking material is Augmented, "A" Qualifty.

4.1.4.3 IDENTIFY SEISMIC CLASSIFICATION OF SSC :

The steel drywell vessel and the concrete floor slab are Seismic Category I structures. Any added coatings or caulks do not affect these seismic capabilities. Therefore there are no seismic qualification requirements for added coatings or caulks. The concrete/steel shell interface is not considered a seismic gap.

4.1.5 IDENTIFY PERFORMANCE REQUIREMENTS:

Coatings and caulk shall not degrade or alter the strength and integrity of the steel containment vessel and the concrete floor slab. Cementitious grout has a cured compressive strength as high, or typically higher than concrete, so it will behave in the same manner as the concrete to which it is applied. This prevents the need for consideration of any new failure effects for the grout. The caulk shall be qualified to remain adhered under all potential drywell conditions identified in procedure ES-027, with the exception of jet impingement.

4.1.6 DESIGN REQUIREMENTS FOR SURVEILANCE AND ACCEPTANCE TESTING:

The design allows for future inspections of the installed caulk as required under the ASME Section XI program.

4.1.7 SPECIFICATIONS, CODES, STANDARDS, OR REGULATORY REQUIREMENTS:

Specification IS-328227-004 Rev 13, "Function Requirements for Drywell Containment Vessel Thickness Examinations".

OC Station Procedure No. 2400-SMM-3150.16, "Mixing and Placement of Grouts". GE NEDO-32686, Rev 0, "Utility Resolution Guidance for ECCS Suction Strainer Blockage".

EP-011, "Methodology for Assigning and Maintaining the Quality Classification of Components".

ES-027, "Environmental Parameters – Oyster Creek NGS".

4.1.8 PWR SUMP PROGRAM IMPACTS FOR BRAIDWOOD, BYRON AND TMI: Not applicable.

4.1.9 CALCULATIONS OR DESIGN ANALYSES AFFECTED:

The effect of the missing curb will not have a significant effect on the Design Basis Accident analysis of the Containment Shell For the following reasons:

The finite element models used in the GE analysis of the containment shell has fixed boundary conditions at the base where it is supported by the concrete foundation. With the sand bed removed, this interface is modeled at the base of the sand bed region (El 8' 11 7/8") The concrete floor inside the drywell at El 10'-3" extends up to an elevation of 12' -3". The concrete floor and curbs above the bottom of the sand pocket region were not considered to provide any support to the Drywell shell.

The thermal analysis considered that the temperatures of the shell behind the curb were lower than that of the shell exposed to the drywell atmosphere. There are two portions of the curb that have been removed, each being approximately 16 inches wide. Cutting this small portion of the curb will expose a portion of the shell to higher temperatures. This will have a negligible affect on the shell thermal distribution and the

ECR 06-00879 rev. 0 Attachment 1, page 3 of 9

thermal analysis stresses. A review of the GE stress report indicated that in the sandbed region the highest stress (primary & secondary) is due to load Case VI (Post –Accident condition) – Gravity, Flooded Seismic) which is a primary stress check and does not included the DBA accident temperature load. The load condition that includes the DBA accident temperature is Load Case V-1. This load case has a maximum primary plus secondary stress in the sandbed region, which is approximately 73 percent of the allowable stress. The Load Case V-1 includes the pressure, gravity, unflooded seismic, seismic relative support displacement and temperature gradient during DBA loads. The load case would conservatively determine combined stresses because the pressure and thermal stress will not maximize simulataneously. The local change in the shell temperature where the curb has been removed will increase the thermal stress in a localized area but this increase is judged not to be significant. The stresses are secondary and localized. The event is a one time loading that has no affect on metal fatigue. Any localized change in the thermal stress can be accommodated by the existing margin to the allowable stress.

As documented in Technical Evaluations A2152754-05, the amount of potential drywell debris that could enter the ECCS suction strainers is evaluated in calculation C-1302-241-E610-081. The grout behaves as the concrete already present in the drywell, and therefore does not contribute to the potential debris. No additional debris will be created by its presence, since it provides the same surface area available for abrasion or spalling during the DBA as the concrete, and has equal or better strength than the concrete.

The caulk can become dislodged by a water jet, and therefore must be addressed as potential additional debris. However, the amount of caulk added is less than the amount of silicone foam and elastomer removed from either one of the two trenches, and the silicone material was removed from both trenches. Therefore there is no net increase in mass that could clog the suction strainers. The calculation does not specifically address the silicone foam in the trenches, but rather generically includes dust, dirt, concrete and debris in typical amounts for nuclear plants. The amounts are not based on the drywell inventory specific to Oyster Creek (except for insulation), but are numbers utilized by the industry as typical. Since the caulk being added is typically installed in nuclear plants, it can reasonably be considered to be captured in the generic debris amounts utilized in the calculation. Thus, from a practical perspective, there is no net increase in the mass of material in the drywell. And from a configuration control perspective, the caulk being installed is represented in the existing mass values used in the calculation. Therefore it is not necessary to revise the numerical values of the calculation, and the calculation remains accurate to the same degree as when it was originally created. However, text is added to alert calculation users of this issue, and that the mass values are considered to include the caulk installed by this ECR.

There are additional facts that reduce the threat of suction strainer clogging from the caulk. <u>The caulk is at the lowest level of the drywell</u>, installed in a corner joint. The position of the recirc pumps and piping are such that a break would impinge on the caulk in a direction that would push it into the corner rather than in a direction that would tear it from the corner. If it were to be dislodged, its position is below the downcomers such that it would have to travel upward in the drywell to reach the torus. In most line breaks,

ECR 06-00879 rev. 0 Attachment 1, page 4 of 9

flow in the drywell is downward to the downcomers, making it unlikely that the caulk strip would be washed upward. The cured caulk has a density roughly 1.5 times that of water, making it likely that it will remain at the bottom of the drywell and not reach the torus.

In some areas, backer rod will need to be installed in the gap between the concrete slab and the steel shell, to reduce the amount of caulk needed. The backer rod is a negligible contribution to debris. The installer estimates that 10' of perimeter will require its use: This amount of rod weighs on the order of a few ounces, which is insignificant compared to the calculation weights of 150 pounds for dust, dirt and concrete, and 25 pounds for miscellaneous additional debris. In addition, the backer rod will float, and therefore will not get to the suction strainers to contribute to their clogging. However, it is very unlikely that the backer rod will dislodge at all. It is a high friction, compressible material that will be wedged into the gap between the steel shell and the concrete. Any water jet or other DBA will not penetrate into this gap with any significant force, so the rod is expected to remain in its installed location under all conditions. Therefore use of the backer rod is acceptable, and no calculation changes are required to reflect its use.

4.1.10 REDUNDANCY, DIVERSITY AND SEPARATION REQUIREMENTS:

Not applicable to this modification.

4.1.11 FAILURE EFFECTS REQUIREMENTS :

As discussed above, the grout is no different than the concrete floor slab already present, so its presence does not add any new potential failure effects. It is used to restore the contour to the trough in the sub-pile room. The grout will be placed in accordance with Procedure 2400-SMM-3150.16 with adequate controls to ensure that the grout will not experience bonding failure to the existing concrete. However, if it became delaminated from the concrete substrate, it would result in localized ponding in the trough, and could potentially reach the sump. Localized ponding in the trough is not a concern, since it would not damage the remaining concrete and would allow a negligible volume of water to remain in the drywell. Any grout that reached the sump would remain on the bottom of the sump, and would not affect the operation of the sump pump.

Procedure ES-027 for the DBLOCA defines the environmental parameters inside the drywell. The caulking materials will survive the DBLOCA environmental parameters with exception of the impingement zone of influence caused by the recirculation piping in close proximity to the caulked joints. Failure of the caulk bond could result in water infiltrating the crevice between the concrete drywell floor and the steel drywell vessel. This is acceptable, as determined in A2152754 E06*. The caulk could become dislodged and travel through the downcomers to the torus. This has been addressed in the debris analysis as discussed above. The caulk is sufficiently flexible to accommodate any movement of the drywell vessel relative to its concrete floor slab, and will not restrict this movement. The caulk remains flexible and will remain adhered under the expected range of relative motion, having an elongation capability of 500 to 550 percent. The caulk

material used has also been successfully tested to the radiation dose associated with plant life service plus accident conditions (see ECR attachments).

4.1.12 USE ATTACHMENT 2 TO IDENTIFY FIRE PROTECTION AND APPENDIX R SAFE SHUTDOWN REQUIREMENTS:

All screening questions of CC-AA-102 Att. 2 are answered "no". Therefore a formal fire protection review is not required. In particular, question 1 is answered "no" based on the following reasons: The grout material is essentially concrete, and is not flammable. The MSDS for the caulk indicates that the material has an NFPA flammability rating of zero, and that it is not a fire hazard. Review by the fire protection program manager indicates that there is no impact to the fire protection and Appendix R safe shutdown requirements and that the amount of polyethylene backer rod material is insignificant, the material is not exposed, there is no fire source in the area, and the environment is inerted.

4.1.13 MATERIAL AND MATERIAL SUITABILITY REQUIREMENTS:

The cementitious grout used is compatible with the wet environment of the drywell and the concrete floor slab to which it is bonded, and is not adversely affected by the radiation levels present. The caulk material is designed for this type of application and has been qualified to perform satisfactorily under drywell design basis accident conditions. Furthermore, the caulking material is compatible with the DW steel shell structure and concrete structure and will not result in harmful chemical reactions to any of these structures. The backer rod is also compatible with the drywell environment, and will not react with the steel, concrete, or drywell atmosphere.

4.1.14 ENVIRONMENTAL CONDITIONS AND IMPACTS:

The installed materials are rated for the drywell normal and accident conditions provided in procedure ES-027. The materials are essentially inert once cured, and will have no effect on the drywell environment. They are not flammable and do not generate any flammable gases, with the exception of the small amount of backer rod added, which has been accepted in the fire protection review. This modification does not affect the temperature, pressure or humidity of the drywell environment.

4.1.15 EQUIPMENT ENVIRONMENTAL QUALIFICATION:

These modifications do not install any equipment requiring environmental qualification, and do not affect the EQ of any existing equipment.

4.1.16 OPERATING EXPERIENCE:

These repairs are based, in part, on the past findings documented in the structural monitoring program, as discussed in the ECR introduction. The caulk applied to the drywell floor joint is the same material used successfully in this application at Peach Bottom, Turkey Point, St. Lucie, Oconee, Catawba, McGuire, and Wolsong, per the coatings consultant on site for the outage (Jon Cavallo, VP of Corrosion Control Consultants and Labs, Inc.).

4.1.17 EPIX DATABASE IMPACTS:

None.

4.1.18 PRA IMPACTS:

Although the Level <u>2 PRA took some credit for the curb probabilistically</u>, the minor amount of concrete removed from the trench in Bay 5 is not significant enough to markedly change LERF or the conclusions of the SAMA analysis, (Ref. IR 550022). The failure probabilities for the OC liner due to core material impingement are not, significantly different than those for other Mark I containments where the concrete curb does not exist. Therefore there are no impacts to the PRA analysis.

4.1.19 SYSTEM OPERATIONAL REQUIREMENTS:

The ECCS suction strainers must not become clogged to the point that they affect the operability of the ECCS systems. The amount of installed material that could become dislodged and reach the suction strainers has been analyzed and found to be within the available margin for continued operability of ECCS systems. Also, materials installed will not affect the operation of the drywell sump pumps.

4.1.20 HUMAN FACTORS REQUIREMENTS:

Not applicable to this ECR.

4.1.21 USE ATTACHMENT 9 TO IDENTIFY PROCEDURE CHANGES:

The requirement to inspect the caulk will be added to procedure ER-OC-330-1006 for the Containment ISI program inspections IAW ASME Section XI program and is tracked under A2152754-11. Based on review of attachment 9 and the impact review performed, there are no other procedure impacts.

Strat. Mon Poor-

4.1.22 TRAINING REQUIREMENTS: None required.

4.1.23 SYSTEM INTERFACE REQUIREMENTS:

This activity will leave the two trenches that were previously filed with a foam material empty. This empty space may slightly delay the measurement of unidentified leak rate which is measured by the 1-8 sump. The open trenches may collect unidentified leakage and temporarily prevent the leakage from reaching 1-8 sump. However this delay is conservatively estimated to be no more than a 30 minutes. The total empty volume of the both trench is estimated to be approximately 50 gallons. Tech. Spec. 3.3.D.1 requires that reactor coolant shall be limited to a 2 gpm increase in a 24 hour period. Assuming a 2 gpm leak were to instantaneously develop and leak into both trenches at the same time, it would take about 30 minutes for the trenches to fill and overflow at which point the leakage would enter the 1-8 sump.

The installed materials are primarily structural and cosmetic repairs, and do not interface with any other plant systems.

4.1.24 LAYOUT AND ARRANGEMENT REQUIREMENTS:

There are no special requirements for these modifications.

4.1.25 USE ATTACHMENT 5 TO DETERMINE RADIATION PROTECTION / ALARA APPLICABILITY:

Based on the responses to the attachment 5 questions, an ALARA review is required for this scope of work.

4.1.26 WALKDOWNS:

Several walkdowns and inspections were performed by engineering, planning and the work group to determine the best course of action and the preferred design solution. The walkdowns established the existing field conditions, and the installability of the intended design solutions.

4.1.27 ACCESS FOR MAINTENANCE, REPAIR, ISI, OR IST:

The design allows for future inspections of the installed caulk as required under the ASME Section XI program, and for future inspections of the trenches to determine if they contain water. The installed caulk and grout does not impede access to any plant equipment.

4.1.28 HANDLING, STORAGE, CLEANING, SHIPPING AND TRANSPORTING REQUIREMENTS:

Cleaning requirements in preparation for application of the caulking material are specified in AWA #3 of this ECR.

4.1.29 EMERGENCY PLAN IMPACT:

None for this modification.

4.1.30 INDUSTRIAL SAFETY REQUIREMENTS:

The MSDS for all materials should be obtained by the work group, and reviewed to determine the applicable hazards and precautions.

4.1.31 USE ATTACHMENT 6 TO DETERMINE IMPACT ON NUCLEAR FUEL, CORE COMPONENTS, CORE DESIGN, REACTIVITY MANAGEMENT, CRITICALITY CONTROL AND ACCOUNTABILITY OF NUCLEAR MATERIALS, AND TRANSIENT AND ACCIDENT ANALYSES:

There are no impacts. The materials used are qualified for the drywell environment. Potential creation of debris under DBA conditions has been evaluated and determined to be bounded by the existing conditions and analyses.

4.1.32 LOAD PATH REQUIREMENTS:

There are no special handling requirements for the materials used for these modifications.

4.1.33 MECHANICAL SYSTEM DESIGN LIMITS:

None applicable.

4.1.34 IDENTIFY CHEMISTRY REQUIREMENTS:

Chemistry has approved the materials applied by this ECR for use in the drywell. Leachable contaminants are within the limits of this environment.

- 4.1.35 ELECTRICAL REQUIREMENTS: Not applicable.
- 4.1.36 INSTRUMENT AND CONTROL REQUIREMENTS: Not applicable.
- 4.1.37 SECURITY REQUIREMENTS: Not applicable.

4.1.38 IDENTIFY CIVIL / STRUCTURAL REQUIREMENTS:

The repairs do not perform a structural function, but only serve to direct water to the drywell sump. The materials utilized are compatible with, and do not affect the structural integrity of the existing structural elements.

4.1.39 IDENTIFY SEISMIC / DYNAMIC QUALIFICATION REQUIREMENTS:

Similar to the above item, the installed materials do not have a seismic function or requirements, and do not impact the seismic capabilities of existing SSC's.

4.1.40 PERSONNEL REQUIREMENTS:

Personnel shall be qualified for installation of the materials specified.

4.1.41 SPECIAL PROCEDURES OR SPECIAL INSTALLATION SPECIFICATIONS: The applicable portions of Specification IS-328227-004 rev. 13 are referred to in the work instructions of AWA #5. Unless directed otherwise within this ECR, all materials shall be installed in accordance with the manufacturer's instructions. Grout is to be installed in accordance with Specification IS-551-81-6 as directed in AWA #1.

4.1.42 IDENTIFY / OBTAIN INTERFACING DEPARTMENT REVIEWS:

Interface reviews have been performed by the work group (Dave Ryan), the Venture planner (John Burt), Operations (Robin Brown), the structural monitoring program owner (Sugit Niogi), the system manager (Sylvain Schwartz), the fire protection program manager (Mark Carlson) and the ISI program manager (Greg Harttraft). The completed reviews are attached to this ECR. All identified impacts have been addressed, or have a tracking mechanism to ensure their completion.

4.1.43 USE ATTACHMENT 11 TO DETERMINE POTENTIAL IMPACT ON LICENSE RENEWAL:

This ECR directs a VT inspection of the drywell 1-8 sump pit liner and tracked under A2152754-13, which will satisfy the structural monitoring requirement for license renewal and tracked under A2152754-13. All of the questions of attachment 11 are

ECR 06-00879 rev. 0 Attachment 1, page 9 of 9

answered "no". The SSC's involved are not affected, and the materials installed do not perform any of the roles or functions addressed by the screening questions.

4.1.44 NEIL REQUIREMENTS:

None.

4.1.45 PERFORM A SINGLE POINT VULNERABILITY (SPV) REVIEW:

A single point vulnerability (SPV) review has been performed for this ECR to identify all events that can result in an unplanned reactor scram in a proactive manner, with the intent of taking action to prevent such events. No SPV's were identified. This ECR does not eliminate any existing SPV's, and does not create any new SPV's.

4.1.46 STEAM GENERATOR REPLACEMENTS:

Not applicable.

4.4 USE ATTACHMENT 7 TO IDENTIFY CONFIGURATION CONTROL ACTIVITIES:

In order to inspect the caulk at the drywell floor under the ISI program, it must be listed as a component in the component database (CRL). Therefore component ID NR01\MB001-INT (system 187) has been created for the caulk.

Drawing BR 4070 sheet 1 is posted by this ECR, to show the caulk installation. Drawing GU 3B-153-34-1000 is also posted to indicate that the silicone foam and elastomer are no longer installed in the 2 trenches (no markup required).

The silicone foam and elastomer removed from the trenches was installed under specification IS-328227-003. This document could not be located in EDMS, but the posting of the drawing (above) to indicate removal of these materials provides sufficient configuration control.

No drawing revision is needed for the grout repairs around the embedded pipes to and from the trough. These repairs restore the trough to its design configuration and do not affect any drawings.

Calculation C-1302-241-E610-081 is revised to indicate that the caulk material is to be considered as included in the debris tally on sheet 5 of the calculation.

4.5 USE ATTACHMENT 8 TO IDENTIFY AFFECTED PROGRAMS:

The ISI program is impacted by this ECR. Future inspection of the caulk is required, and this is implemented by revision to procedure ER-OC-330-1006 and tracked under A2152754-11. Furthermore, the Structures Monitoring Program is impacted by this ECR and Procedure ER-OC-450 will be updated as required by the program owner and will be tracked under A2152754-11.

*Note: This document refers to A2152754 E06 in several places and relies on its conclusions. At the time of preparation of this document, that evaluation had been prepared and reviewed, but not yet approved. Therefore its approval, with conclusions that still support the information in this document, must be verified prior to closure of this document.

Evaluation A2152754 E06 has been complete without impact on this ECR

B. EVALUATION:

APPROVED DISPOSITION:

AWA FOR DRYWELL FLOOR REPAIRS:

ŧ

THE FOLLOWING ADVANCED WORK AUTHORIZATIONS ARE PREPARED IN ACCORDANCE WITH CC-AA-103. THE WORK DESCRIBED BELOW DOES NOT AFFECT ANY IN-SERVICE EQUIPMENT. THE SCOPE AND SPECIAL INSTRUCTIONS ARE AS DESCRIBED IN EACH SECTION BELOW.

AWA #1 - SUB-PILE ROOM (CONCRETE AREA UNDER REACTOR VESSEL) TROUGH CLEANING, INSPECTION AND PARIAL REPAIR:

THE TROUGH IS THE DRAINAGE TRENCH AT THE SUB-PILE ROOM PERIMETER. THE TROUGH MUST BE THOROUGHLY CLEANED AND INSPECTED, TO DETERMINE IF REPAIRS ARE REQUIRED. ALL STANDING WATER SHOULD BE REMOVED FROM THE TRENCH. ALL LOOSE MATERIAL (DEBRIS, LOOSE AGGREGATE, ETC.) MUST BE REMOVED. IN PARTICULAR, ALL LOOSE OR EASILY LOOSENED MATERIAL IN THE TROUGH, AROUND THE PIPES THAT CONNECT TO THE SUMP SHOULD BE REMOVED. DAMAGE TO ANY AREAS OF THE TROUGH SHOULD BE QUANTIFIED. WHERE DEPRESSIONS IN THE TROUGH FLOOR ARE VISUALLY NOTICED, PLACE A 24" LONG STRAIGHT EDGE IN THE TROUGH AND MEASURE THE DEPTH OF THE DEPRESSION. NOTIFY ENGINEERING OF THE DEPTH, EXTENT, AND LOCATION OF ANY POCKETS OR DEPRESSIONS GREATER THAN 1/4" DEEP. AT THE DRAIN PIPES FROM THE TROUGH TO THE SUMP, PROVIDE ENGINEERING WITH MEASUREMENTS OF DEPTH, WIDTH AND HEIGHT OF ANY CONCRETE DAMAGE. AT THE FOUR PIPES THAT PASS WATER FROM OUTSIDE OF THE SUB-PILE ROOM, NOTE AND INFORM ENGINEERING OF THE BOTTOM ELEVATION OF THE PIPE RELATIVE TO THE BOTTOM SURFACE OF THE TROUGH (E.G. PIPE BOTTOM IS 3/8" LOWER THAN BOTTOM OF TROUGH). GROUT REPAIRS CAN BE PERFORMED TO THE AREA AROUND THE PIPES TO THE SUMP AND THE PIPES FROM OUTSIDE THE SUB-PILE ROOM TO INSIDE, AS NEEDED, IN ACCORDANCE WITH PECIFICATION OCIS 551-81-6 (AS A STRUCTURAL REPAIR). MASTERFLOW 713 PLUS" OR "MASTERFLOW 928" SHALL BE

USED FOR THE REPAIRS (SAFETY RELATED MATERIAL), AND IT SHALL BE MIXED IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS RATHER THAN THOSE IN THE SPECIFICATION. TEST CUBE SAMPLES DO NOT NEED TO BE TAKEN AS DIRECTED IN THE SPECIFICATION, SINCE THIS APPLICATION DOES NOT

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

PAGE 0003

APPROVED DISPOSITION:

RELY ON THE STRENGTH OF THE CURED GROUT. BASED ON A PRELIMINARY INSPECTION BY SAM MARKOS, THE AREAS WHERE A GROUT REPAIR IS DEFINITELY REQUIRED AROUND THE DRAIN PIPE ARE: BOTH PIPES TO THE SUMP, AT THE POINT WHERE THEY EXIT THE TROUGH, AND THE INBOARD SIDE OF THE PIPE THROUGH THE PEDESTAL WALL, AT AZIMUTH 270. THESE THREE PIPES REQUIRE REMOVAL OF ALL LOOSE MATERIAL AROUND THE PIPE, DOWN TO CLEAN, SOLIDLY SECURED AGGREGATE. THE AREA MUST BE PREPARED IN ACCORDANCE WITH THE STATION GROUTING PROCEDURE PRIOR TO GROUTING. CARE MUST BE TAKEN NOT TO CREATE ANY BLOCKAGES TO FLOW THAT WOULD CREATE STANDING WATER IN THIS AREA. OTHER REPAIRS TO THE TRENCH WILL BE SPECIFIED BY ENGINEERING FOLLOWING REVIEW OF THE DATA PROVIDED.

THE ABOVE SCOPE OF WORK DOES NOT ALTER THE DESIGN OR FUNCTION OF ANY PLANT SSC. CLEANING AND INSPECTION ARE ROUTINE TASKS. ANY GROUT REPAIRS SERVE TO RESTORE THE AFFECTED SSC TO ITS INTENDED DESIGN CONDITION.

COORDINATION WITH THE OCC IS IMPERATIVE TO MAINTAIN THE ROUGH AREA DRY DURING THE REPAIR AND CURING PROCESSES.

P. KESTER AWA #1 PREPARED BY: REVIEWED BY: DAN FIORELLO AUTHORIZATION FOR THIS SCOPE IS PROVIDED TO GEORGE SEVCIK (OWP) BY HOWIE RAY (SMDE DESIGNEE FOR S. HUTCHINS) (SMDE) ON 10/24/06, 12:00.

AWA #2 - DRYWELL SUMP CLEANING AND INSPECTION: _____

THE DRYWELL SUMP COULD BE A SOURCE OF WATER INFILTRA-TION INTO THE CONCRETE. THE SUMP INTERIOR SHOULD BE DRAINED AND CLEANED SO THAT THE STAINLESS STEEL LINER CAN BE INSPECTED FOR FLAWS OR DAMAGE. TEMPORARY DAMMING SHOULD BE PLACED TO PREVENT WATER FROM ENTERING THE SUMP UNTIL THE INSPECTION IS COMPLETE. THE SUMP SHOULD BE CLEANED SUFFICIENTLY SUCH THAT A VT-1 INSPECTION OF THE INTERIOR SURFACES OF THE SUMP LINER CAN BE PERFORMED. THE RESULTS OF THE INSPECTION SHOULD BE PROVIDED TO ENGINEERING. IF ANY FLAWS ARE FOUND, REPAIRS WILL BE SPECIFIED ACCORDINGLY.

THE ABOVE SCOPE OF WORK DOES NOT ALTER THE DESIGN OR UNCTION OF ANY PLANT SSC. CLEANING AND INSPECTION ARE DUTINE TASKS.

AWA #2 PREPARED BY: P. KESTER REVIEWED BY: DAN FIORELLO AUTHORIZATION FOR THIS SCOPE IS PROVIDED TO GEORGE SEVCIK (OWP) BY HOWIE RAY (SMDE DESIGNEE FOR S. HUTCHINS)

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

(SMDE) ON 10/24/06, 12:00.

AWA #3 - DRYWELL FLOOR-TO-SHELL INTERFACE, CLEANING, PREP FOR CAULKING:

A BEAD OF CAULK WILL BE APPLIED TO THE DRYWELL SHELL WHERE IT MEETS THE CONCRETE STEPPED CURBING AROUND THE PERIMETER OF THE CONCRETE DRYWELL FLOOR SLAB AT ELEVATION 10'-3". THE SCOPE OF THIS AWA IS THE CLEANING AND PREPARATION OF THE CONCRETE AND STEEL SURFACES FOR CAULKING, BUT DOES NOT INCLUDE THE INSTALLATION OF THE ALL DEBRIS AND LOOSE CONCRETE SHOULD BE CAULKING. REMOVED FROM THE INTERFACE. HAND TOOLS (DENTIST PICK, SMALL WIRE BRUSH, CHIPPING HAMMER, ETC.) AND A VACUUM SHOULD BE USED. THE CONCRETE SURFACE IS REPORTED TO BE SUFFICIENTLY ROUGH FOR ADHESION OF THE CAULK, AND THEREFORE MAY NOT REQUIRE ROUGHENING. THIS SHOULD BE A BAND OF AT LEAST 1" WIDTH OF ASSURED BY INSPECTION. CONCRETE ADJACENT TO THE DRYWELL SHELL SHOULD BE ASSURED TO HAVE A ROUGHNESS EQUIVALENT TO 60 GRIT SANDPAPER, OR ROUGHER. THE STEEL SURFACE SHOULD ALSO BE PREPARED FOR A AND OF AT LEAST 1" ADJACENT TO THE CONCRETE. ANY LOOSE R POORLY ADHERED MATERIAL SHOULD BE REMOVED USING HAND TOOLS SUCH AS A STIFF BRUSH, A PUTTY KNIFE OR SCOTCH-BRITE TO SSPC-SP 2 STANDARD. WELL ADHERED COATINGS DO NOT NEED TO BE REMOVED.

THE ABOVE SCOPE OF WORK DOES NOT ALTER THE DESIGN OR FUNCTION OF ANY PLANT SSC. CLEANING AND INSPECTION ARE ROUTINE TASKS.

AWA #3 PREPARED BY: P. KESTER REVIEWED BY: DAN FIORELLO AUTHORIZATION FOR THIS SCOPE IS PROVIDED TO GEORGE SEVCIK (OWP) BY HOWIE RAY (SMDE DESIGNEE FOR S. HUTCHINS) (SMDE) ON 10/24/06, 12:00.

AWA #4 - EXCAVATE ADDITIONAL CONCRETE FROM THE BAY #5 TRENCH

MORE OF THE DRYWELL SHELL MUST BE EXPOSED AT THE BOTTOM OF THE BAY #5 TRENCH TO FACILITATE ADDITIONAL DRYWELL SHELL UT MEASUREMENTS. THE BAY #5 TRENCH IS IN THE DRYWELL ELEV 10'-3" FLOOR SLAB, IN THE BAY #5 REGION, ADJACENT TO THE DRYWELL SHELL.

CONCRETE AT THE BOTTOM OF THE BAY #5 TRENCH SHALL BE EXCAVATED AS REQUIRED TO EXPOSE AN ADDITIONAL 3-1/2" (+/-) BAND OF THE DRYWELL SHELL. THE BAND SHALL BE ACROSS THE ENTIRE WIDTH OF THE TRENCH.

EXTREME CARE SHALL BE EXERCISED TO AVOID DAMAGE

NUMBER: <u>OC</u> <u>06-00879</u> 000

ECR TYPE: DCP

PAGE 0005

APPROVED/ DISPOSITION:

(NICKS, CUTS, SCRAPES) TO THE DRYWELL SHELL.

ALSO NOTE THAT A VERTICAL STEEL PLATE STIFFENER (APPROX 1" THICK) IS EMBEDDED IN THE CONCRETE AT THE BOTTOM OF THE BAY #5 TRENCH. THE STIFFENER PLATE IS PARALLEL TO THE DRYWELL SHELL AND APPROXIMATELY 7" FROM THE SHELL. A PORTION OF THE TOP EDGE OF THIS PLATE IS EXPOSED IN THE EXISTING TRENCH EXCAVATION. EXTREME CARE SHALL BE EXERCISED TO AVOID DAMAGE (NICKS, CUTS, SCRAPES) TO THIS STIFFENER PLATE.

ALL WORK SHALL BE DONE WITH HAND TOOLS.

ALL MATERIAL REMOVED SHALL BE QUARANTINED FOR FURTHER INSPECTION/TESTING AS REQUIRED.

DOCUMENT THE FINAL CONFIGURATION OF THE TRENCH (DEPTH AND WIDTH) AFTER THE EXCAVATION. FORWARD THIS INFORMATION TO THE PROJECT ENGINEERING TEAM (ATTENTION: HOWIE RAY).

DIGITAL PHOTOGRAPHS SHALL BE TAKEN OF THE NEWLY (POSED DRYWELL SHELL IMMEDIATELY AFTER EXCAVATION IS COMPLETE. DIGITAL PHOTOGRAPHS SHALL ALSO BE TAKEN OF THE SURFACE OF THE EXCAVATED CONCRETE THAT WAS ADJACENT TO THE DRYWELL SHELL. ALL DIGITAL PHOTOGRAPHS FILES SHALL BE TRANSMITTED TO THE PROJECT ENGINEERING TEAM (ATTENTION: HOWIE RAY).

THE SCOPE OF THIS AWA DOES NOT ALTER OR IMPACT THE FUNCTION OF ANY PLANT SSC⁺S.

AWA PREPARED BY: DP KNEPPER - PEDM AWA REVIEWED BY: DAN FIORELLO

AUTHORIZATION FOR THIS SCOPE IS PROVIDED TO JIM HEARNS (OWP) BY HOWIE RAY (SMDE DESIGNEE FOR S. HUTCHINS) (SMDE) ON 10/24/06, 18:00.

AWA #5 - CAULK DRYWELL SHELL-TO-CONCRETE FLOOR JOINT:

AT THE OUTBOARD PERIMETER OF THE ELEV. 10'-3" DRYWELL FLOOR, THE CONCRETE SLAB MEETS THE DRYWELL SHELL. THIS INTERFACE HAS BEEN PREPARED FOR CAULKING UNDER AWA #3. THE CAULK WILL BE APPLIED TO THAT JOINT UNDER THIS AWA. HE CAULK SHALL LAP ONTO THE CONCRETE AND STEEL SURFACES X 1/4" TO 3/4" ON EACH SURFACE.

THE CAULK IS TO FOLLOW THE CONCRETE-TO-STEEL INTERFACE, FOLLOWING THE CHANGES IN CURB ELEVATION (INCLUDING THE SIDES AND TOPS OF THE CURBS), AND THE DIPS INTO THE TWO TRENCHES. THE BAY 5 TRENCH SHOULD NOT BE CAULKED UNTIL ALL NDE WORK IS

NUMBER: <u>OC</u> <u>06-00879</u> 000

ECR TYPE: DCP

APPROVED DISPOSITION:

COMPLETED, BUT PRIOR TO RECOATING THE STEEL. TECHNICAL EVALUATION A2152754-5 IS BEING DEVELOPED TO DOCUMENT THE TECHNICAL BASIS FOR THIS AWA, AND PROVIDES A DETAILED SKETCH OF THE CAULK CONFIGURATION ALONG WITH MANUFACTURERS INSTRUCTIONS. THE CAULKING MATERIAL SHALL BE THIOKOL 2235M BY POLYSPEC. THE INSTALLATION OF THE CAULKING MATERIAL IS ACCEPTABLE PROVIDED THAT CAULKING MATERIAL IS QUALIFIED TO BE USED INSIDE THE DRYWELL AS AUGMENTED QUALIFY, QA CLASS "A" OR BETTER. THE SURFACE PREPARATION SHALL BE AS DESCRIBED IN AWA #3 OF THIS ECR, AND INSTALLATION SHALL BE IAW THE MANUFACTURER'S INSTRUCTIONS (EXCEPT THAT PRIMER, BACKER ROD AND BOND BREAKER TAPE ARE NOT REQUIRED). OV VERIFICATION IS REQUIRED FOR PREPARATION (PER AWA #3 OF THIS ECR) AND INSTALLATION (MIXING, POT LIFE, APPLICATION). DBA QUALIFICATION OF THE CAULK IS BEING FINALIZED.

WORK SCOPE:

1- PERFORM UT OF DRYWELL SHELL IN THE BAY 5 TRENCH AFTER ADDITIONAL EXCAVATION DESCRIBED IN AWA #4 HAS BEEN COMPLETED. UT SCOPE IS SIMILAR TO THAT DESCRIBED IN ECTION 3.2.6 OF SPECIFICATION IS-328227-004 REV. 13, BUT OR THE NEWLY EXPOSED STEEL AREA IN THE TRENCH (REF. AWA #4).

2- CLEAN/PREP STEEL AND CONCRETE SURFACES FOR CAULKING AS DESCRIBED IN AWA #3

3- INSTALL CAULKING AS DESCRIBED ABOVE. FINISHED CAULK SHOULD FORM A CONTINUOUS BARRIER AROUND THE CIRCUMFERENCE OF THE CONCRETE FLOOR, WHERE IT MEETS THE STEEL DRYWELL SHELL.

4- NDE SHALL PERFORM A PSI (PRE-SERVICE INSPECTION -VT3) OF THE FINAL CAULK CONFIGURATION IN ACCORDANCE WITH ASME SECTION XI REPAIR/REPLACEMENT PROGRAM.

5- RECOAT THE DRYWELL SHELL SURFACE IN BOTH THE BAY 5 AND BAY 17 TRENCHES AS DESCRIBED IN SECTION 3.2.2.4.3 OF SPECIFICATION IS-328227-004 REV. 13.

THIS AWA DOES NOT AFFECT ANY IN-SERVICE EQUIPMENT.

AWA #5 PREPARED BY: P. KESTER REVIEWED BY: DAN FIORELLO AUTHORIZATION FOR THIS SCOPE IS PROVIDED TO JOHN BURT (VENTURE) BY F.H. RAY (SMDE DESIGNEE FOR S. HUTCHINS) (SMDE) ON 10/25/06, 13:30.

OTE REVISION OF THE ABOVE AWA #5: THE MAXIMUM LAP ENGTH OF THE CAULK ONTO THE CONCRETE AND STEEL HAS BEEN REDUCED FROM 1" TO 3/4" TO LIMIT THE AMOUNT OF MATERIAL ADDED TO THE DRYWELL.

AS REVIEWER OF THE ORIGINAL AWA, I HAVE REVIEWED AND AGREE WITH THE REVISED LAP LENGTH - DAN FIORELLO

NUMBER: <u>OC</u> <u>06-00879</u> 000

ECR TYPE: DCP

APPROVED DISPOSITION:

CHANGE APPROVED ON 10/26/06 AT 07:00 BY HOWIE RAY. JOHN BURT WAS NOTIFIED BY DAVE KNEPPER, AND A MARKED-UP SKETCH REFLECTING THE CHANGE WAS PROVIDED TO HIM.

REVISION 2 TO THE AWA #5:

AWA #5 AND ITS REVISION PROVIDE INSTRUCTIONS TO CAULK SURFACES BETWEEN THE DRYWELL VESSEL PLATE AND THE CONCRETE IN THE TWO TRENCHES. AWA #5 USED MASTERFLOW 928 GROUT MATERIAL. TO APPLY THE CAULK THE SURFACES MUST BE DRY. HOWEVER THE SURFACE AT THE BOTTOM OF THE TRENCH IN BAY 5 AND THE SEAM BETWEEN THE CONCRETE AND STEEL ARE MOIST EVEN AFTER APPLYING MASTERFLOW 928. THEREFORE, THE CAULK CANNOT BE APPLIED. IF THIS CONDITION CONTINUES TO EXIST, PREPARE THE SURFACES AND INSTALL THE MINIMUM ALLOWED LAYER 1/2 INCH AND MAXIMUM 2 INCH OF GROUT IN ACCORDANCE WITH AWA #1. THE GROUTING MATERIAL SHALL BE "747 RAPID-SETTING GROUT" MANUFACTURED BY BASF AND MIXING SHALL BE PLASTIC) ACHIEVE A FINAL SETTING TIME OF 80 MINUTES. THE AYER OF GROUT SHALL BE INSTALLED AT THE BOTTOM OF THE TRENCH AT MOIST SURFACES OVER EXISTING MASTERFLOW 928 HAVE BEEN PLACED WHERE CONCRETE MEETS THE DRYWELL VESSEL. THE PURPOSE OF THE ADDITIONAL LAYER OF 747 RAPID-SETTING GROUT IS TO COVER THE MOIST AREAS TO ALLOW PROPER APPLICATION OF THE CAULK. WAIT A MINIMUM OF 80 MINUTES FOR THE GROUT TO SET BEFORE APPLYING ANY CAULK. THIS GROUT DOES NOT PERFORM ANY SAFETY RELATED FUNCTION. THE REQUIRED STRENGTH IS MINIMAL AND IS PLACED TO FORM A SUITABLE SURFACE FOR CAULK. THE MATERIAL WILL BE CONFIRMED TO BE SET BEFORE APPLICATION OF THE CAULK. THEREFORE, THE MATERIAL MAY BE COMMERCIAL GRADE.

THIS AWA AND ITS REVISIONS DO NOT AFFECT ANY IN SERVICE EQUIPMENT. CLEANING AND INSPECTION ARE ROUTINE TASKS.

AWA #5, REVISION 2 PREPARED BY: NIOGI, SUJIT (PIMS INPUT BY DJF)

REVIEWED BY: DAN FIORELLO

HIS AWA REVISION 2 IS APPROVED BY F. H. RAY FOR S. HUTCHINS (SMDE)

THIS AWA #5, REVISION 2 IS PROVIDED TO DAVE RYAN AT 18:45 11/02/06 BY F.H. RAY

END OF AWA #5, REVISION 2

NUMBER: <u>OC 06-00879 000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

AWA #5 REVISION 3 BASED ON THE LATE DELIVERY OF THE 747 GROUT, IT IS PERMISSABLE TO USE THE BASF MASTERFLOW 928 GROUT. PER THE MANUFACTURE PRODUCT DATA SHEET, MASTERFLOW 928 WILL REACH A FINAL SET IN 4 HOURS. THE CONSISTANCY OF THE 928 SHOULD BE MIXED TO PLASTIC CONSISTANCY. PER TELEPHONE WITH THE TECHNICAL REPRESENTATIVE OF POLYSPEC THE MANUFACTURER OF THIOKOL 2235M THE CAULK CAN BE APPLIED AFTER THE GROUT REACHES THE FINAL SET, REVISION 3 TO AWA #5 AUTHORIZES THE USE OF MASTERFLOW 928. THE MINIMUM THINKNESS OF THE APPLICATION NEEDS TO BE CONSISTANT WITH THE EARLIER GUIDANCE FOR MASTERFLOW 928.

AWA #5 REVISION 3 PREPARED BY J. HALLENBECK

REVIEWED BY:NIOGI, SUJIT

THIS AWA REVISION 3 IS APPROVED BY: MAKAR, JOHN

HIS AWA #5 REVISION 3 IS PROVIDED TO DAVE RYAN AT: 12:05 OV 3, 2006

END OF AWA #5 REVISION 3

SCOPE OF AUTHORIZED WORK:

BASED ON THE SIZE OF THE GAP BETWEEN THE DRYWELL CONCRETE FLOOR SLAB AND THE STEEL DRYWELL SHELL, IT IS DESIRED TO INSTALL BACKER ROD IN SOME AREAS TO MINIMIZE THE AMOUNT OF CAULK NEEDED. THE BACKER ROD IS A POLYETHYLENE MATERIAL (204-07780) THAT WILL BE COVERED BY THE CAULK, AND THEREFORE WILL NOT BE EXPOSED. THE INSTALLER ESTIMATES THAT 10' OF PERIMETER WILL REQUIRE ITS USE. THIS AMOUNT OF ROD WEIGHS ON THE ORDER OF A FEW OUNCES. RELATIVE TO THE MATERIAL WEIGHTS IN THE SUCTION STRAINER CLOGGING CALCULATION, THE WEIGHT IS INSIGNIFICANT COMPARED TO THE CALCULATION WEIGHTS OF 150 POUNDS FOR DUST, DIRT AND CONCRETE, AND 25 POUNDS FOR MISCELLANEOUS ADDITIONAL DEBRIS. IN ADDITION, THE BACKER ROD WILL EITHER FLOAT, OR MELT AND FLOWN DOWN HROUGH THE GAP BETWEEN THE CONCRETE AND THE STEEL SHELL F EXPOSED TO EXTREME TEMPERATURE. THEREFORE, THE BACKER ROD WILL NOT GET TO THE SUCTION STRAINERS TO CONTRIBUTE THEIR CLOGGING. PRIMARILY, THOUGH, THE BACKER ROD WILL BE WEDGED INTO THE GAP BETWEEN THE SHELL AND THE CONCRETE, AND IS THEREFORE VERY UNLIKELY TO BE DISLODGED BY ANY DBA IN THE DRYWELL.

NUMBER: <u>OC</u> <u>06-00879</u> 000

ECR TYPE: DCP

APPROVED DISPOSITION:

MARK CARLSON AND TIM TRETTEL WERE CONSULTED FOR FIRE PROTECTION CONCERNS, AND THEY INDICATED THAT BASED ON THE AMOUNT AND THE LOCATION, USE OF THE BACKER ROD IS ACCEPTABLE WITH REGARD TO FIRE LOADING ADDED TO THE DRYWELL. THEREFORE AUTHORIZATION IS GIVEN TO UTILIZE BACKER ROD IN THIS APPLICATION.

PREPARED BY: P. KESTER CHANGES TO THE ABOVE AWA WERE MADE BY THE REVIEWER BASED ON THE PREPARER INPUT.

AS STATED IN CC-AA-103, THIS WORK IS BEING PERFORMED AT RISK AND DOES NOT AFFECT ANY IN SERVICE EQUIPMENT.

THIS AUTHORIZATION IS GIVING TO TOM BADDERS, VENTURE PLANNING.

INDEPENDENTLY REVIEWED BY S. MARKOS

SCOPE OF WORK:

WALK DOWN BY WILLIAMS COATING INC. REVEALED THAT APPROXIMATELY 4 INCH WIDE VOID EXIST IN THE TROUGH ADJACENT TO THE SUMP 1-8. ALSO IT APPEARS THAT A FOREIGN GLASS OBJECT IS LODGED IN TO THE VOID. THE OBJECT SHALL BE REMOVED AS MUCH AS POSSIBLE BY BREAKING IT IN TO SMALL PIECES AND VACUUM CLEANING THE BROKEN GLASS PIECES. ALL PIECES SHALL BE RETAINED FOR LATER EVALUATION. AFTER REMOVING THE BROKEN GLASS PIECES THE VOID SPACE SHALL FILLED WITH GROUT WITH "MASTERFLOW 713 PLUS" OR "MASTERFLOW 928". THIS HAS BEEN APPROVED FOR APPLICATION IN THE DRYWELL PER AWA #1.

SPECIAL INSTRUCTIONS':

LL THE STEPS FOR CLEANING, SURFACE PREPARATION, MIXING ND PLACEMENT OF GROUT SHALL BE AS DELINEATED IN AWA #1 AND MANUFACTURER INSTRUCTIONS SHALL BE FOLLOWED. IF THE VOID IS MORE THAN 2" WIDE, 33% BY WEIGHT OF CLEAN, DAMP 3/8" PEA GRAVEL MEETING THE REQUIREMENTS OF ASTM C33 MAY BE ADDED TO THE MIXTURE. SEVENTEEN POUNDS OF PEA GRAVEL SHALL BE ADDED TO EVERY 50 POUNDS OF GROUT.

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

GROUT AND PEA GRAVEL SHALL BE AT ROOM TEMPERATURE (APPROXIMATELY 70 DEGREES F). THE GROUT MIXTURE SHALL BE COMPACTED WITH A STEEL ROD OR SIMILAR DEVICE TO ELIMINATE VOIDS AND CONSOLIDATE THE GROUT MIXTURE AS IT BEING PLACED IN THE VOID.

THE AWA DOES NOT AFFECT ANY IN SERVICE EQUIPMENT. CLEANING AND INSPECTION ARE ROUTINE TASKS. ANY GROUT REPAIRS SERVE TO RESTORE THE AFFECTED SSC TO ITS INTENDED DESIGN CONDITION.

AWA #7 PREPARED BY S. NIOGI. REVIEWED BY: P. TAMBURRO AND DAN FIORELLO

THIS AWA IS APPROVED BY F.H. RAY FOR S. HUTCHINS (SMDE) THIS AWA IS PROVIDED TO G. SEVCIK AND B. MAZE AT 1930 ON 10/28/06 BY F.H. RAY.

ENSURE ALL DEBRIS REMOVED FROM THE VOID IN THE CONCRETE TROUGH IS RETAINED FOR LATER EVALUATION.

THE AWA #7: IF THE WIDTH OF THE VOID IS 2 INCHES OR SMALLER PEA GRAVEL IS NOT REQUIRED TO BE ADDED TO THE GROUT MIXTURE.

REVISION 1 TO AWA #7 IS PREPARED BY SUJIT NIOGI REVISION 1 TO AWA #7 WAS REVIEWED BY DAN FIORELLO

AWA 7, REVISION 1 AUTHORIZATION: THIS AWA IS APPROVED BY F.H. RAY FOR S. HUTCHINS (SMDE) AND I PROVIDED TO D. RYAN AND J. BURT AT 1100 ON 10/30/06 BY F.H. RAY.

AWA #8 - SEALING TRENCH IN BAY 5

SCOPE OF WORK

AWA #5 PROVIDES INSTRUCTIONS TO CAULK SURFACES BETWEEN THE DRYWELL VESSEL PLATE AND THE CONCRETE IN THE TWO TRENCHES. TO APPLY THE CAULK THE SURFACES MUST BE DRY. HOWEVER THE SURFACE AT THE BOTTOM OF THE TRENCH IN BAY 5 AND THE SEAM BETWEEN THE CONCRETE AND STEEL ARE OIST. THEREFORE THE CAULK CANNOT BE APPLIED. THIS CONDITION CONTINUES TO EXIST, PREPARE THE SURFACES AND INSTALL THE MINIMUM ALLOWED LAYER (1 INCH) OF GROUT IN ACCORDANCE WITH AWA #1. THE LAYER OF GROUT SHALL BE INSTALLED AT THE BOTTOM OF THE TRENCH AT MOIST SURFACES WHERE EXISTING CONCRETE MEETS THE DRYWELL VESSEL. THE PURPOSE OF THE LAYER OF GROUT IS TO COVER

PAGE 0011

ECR Printout

NUMBER: <u>OC</u> <u>06-00879</u> 000

ECR TYPE: DCP

APPROVED DISPOSITION:

THE MOIST AREAS TO ALLOW PROPER APPLICATION OF THE CAULK. WAIT A MINIMUM OF 24 HOURS FOR THE GROUT TO CURE.

APPLY THE CAULK ON DRY SURFACES BETWEEN THE GROUT AND THE STEEL VESSEL AND OVER LAP THE AREAS WHERE OTHER CAULKING HAS ENDED.

THE AWA, DOES NOT AFFECT ANY IN SERVICE EQUIPMENT CLEANING AND INSPECTION ARE ROUTINE TASKS. ANY GROUT REPAIRS SERVE TO RESTORE THE AFFECTED SSC TO ITS INTENDED CONFIGURATION.

AWA #8 PREPARED BY P. TAMBURRO

THIS AWA IS PROVIDED TO DAVE RYAN AT 1600 10/30/06 BY H. RAY.

END OF AWA 8

AWA #9 - LEAK TEST OF TROUGH INSIDE THE PEDESTAL, EL.10'-9" UNDER VESSEL

SCOPE OF WORK

THE TROUGH IS APPROXIMATELY 8" DEEP AND LOCATED INSIDE THE REACTOR SUPPORT PEDESTAL AT EL.10'-9". THERE ARE FOUR 4" DIAMETER PIPE SLEEVES AT 90 DEGREES APART THROUGH THE 4 FEET REACTOR PEDESTAL WALL FOR DRAINING WATER FROM DRYWELL FLOOR EL. 10'-3" TO THE TROUGH. THE INVERT ELEVATION OF THE 4" DIAMETER PIPE SLEEVE IS 10'-3". THE TROUGH IS CONNECTED TO THE SUMP 1-8 BY TWO 2" DIAMETER PIPE SLEEVES. THE INVERT ELEVATION OF THE 2" DIAMETER PIPE SLEEVE IS 10'-1 1/4". THIS AWA #9 PROVIDES THE INSTRUCTIONS TO PLUG THESE SIX SLEEVES (FOUR 4" DIAMETER AND TWO 2" DIAMETER).

THE SLEEVES CAN BE PLUGGED USING TAPERED SILICONE RUBBER PLUGS, MCMASTER-CARR CATALOG PART NO. 277K75 FOR 4" DIAMETER PIPE SLEEVES (FOUR REQUIRED) ND MCMASTER-CARR CATALOG PART NO. 9277K79 FOR 2" DIAMETER PIPE SLEEVES (TWO REQUIRED). THESE PLUGS SHALL BE INSERTED FROM INSIDE THE PEDESTAL IN TO THE PIPE SLEEVES. AFTER THE PLUGS ARE INSERTED IN TO THE SLEEVES THE SURFACE AROUND THE PLUGS BETWEEN THE PIPE SLEEVE AND THE PLUG SHALL BE COVERED WITH DUCT TAPE OR

PAGE 0012

E C R Printout

NUMBER: OC 06-00879 000

ECR TYPE: DCP

APPROVED DISPOSITION:

EQUAL AS APPROVED BY THE CHEMISTRY AND OPERATION DEPARTMENT. THE SURFACES MUST BE DRY BEFORE THE TAPE IS APPLIED. ALTERNATE TYPE PLUGS AS APPROVED BY ENGINEERING MAY BE UTILIZED IF REQUIRED.

BEFORE FILLING THE TROUGH WITH WATER, USING A THIN STEEL NARROW RULER OR THIS NARROW FLAT BAR (OR EQUIVALENT) TO VERIFY THAT NO ADDITIONAL VOIDS EXIST IN THE TROUGH THAT COULD ADD TO THIS LEAKAGE PATH.

IF SIGNFICANT VOIDS ARE DISCOVERED, REPAIR USING GROUT. REPAIR STEPS FOR CLEANING, SURFACE PREPARATION, MIXING AND PLACEMENT OF GROUT SHALL BE AS DELINEATED IN AWA #1 AND MANUFACTURER INSTRUCTIONS SHALL BE FOLLOWED. IF REPAIR BY GROUT IS PERFORMED, ALLOW 24 HRS FOR CURING PRIOR TO PLUGGING THE DRAIN HOLES OR PERFOMING THIS PMT TEST OF THE SUBJECT TROUGH. WATER IN BAYS 15 AND 17 TRENCHES SHOULD BE VACUUMED OUT. FILL THE TROUGH WITH WATER AT LEAST 7" DEEP AND MONITOR THE HEIGHT OF THE WATER FOR TWO HOURS AND CAREFULLY RECORD THE DEPTH. REFILL THE TROUGH WITH WATER TO 7" HEIGHT IF ANY WATER IS LOST DURING THE FIRST NO HOURS. AFTER THE TROUGH IS REFILLED, MEASURE THE EIGHT OF WATER EVERY ONE HOUR FOR NEXT FOUR HOURS.

THE HEIGHT OF WATER SHALL BE MEASURED AT 90 DEGREE DISTANCES APART USING THE EXACT LOCATIONS EACH TIME.

ACCEPTANCE CRITERIA - THE LEVEL AFTER 4 HOURS SHALL NOT HAVE DROPPED MORE THAN 1/4 INCH WITH A MEASURING ACCURACY OF 1/16 INCH

THE AWA DOES NOT AFFECT ANY IN SERVICE EQUIPMENT. CLEANING AND INSPECTION ARE ROUTINE TASKS. ALL PLUGS AND THE TAPE SHALL BE REMOVED AFTER THE LEAK TEST AND THE AFFECTED AREA OF THE SSC SHALL BE RESTORED TO ITS INTENDED CONFIGURATION.

REVISION 1 TO AWA 9 NOTE THAT REVISION 1 TO AWA 9 CHANGED THE ACCEPTANCE CRITERIA TO A DROP IN WATER LEVEL OF 1/4 INCH WITH A

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

MEASURING ACCURACY OF 1/16 INCH. THE PURPOSE OF THE TEST IS CHECK FOR ANY GROSS LEAKAGE FROM THE TROUGH THROUGH CRACKS AND VOIDS. THERE WILL BE SOME LOSS OF WATER THROUGH EVAPORATION. ALSO SINCE CONCRETE IS PERMEABLE, THERE WILL BE SOME LOSS OF WATER THROUGH SEEPAGE INTO THE SOUND CONCRETE.

REVISION 1 TO AWA 9 PREPARED BY: DAN FIORELLO

REVISWION 1 TO AWA 9 REVIEWED BY PETE TAMBURRO

THIS AWA REVISION HAS BEEN PROVIDED TO DAVE RYAN AND JOHN BURT AT 15:00 ON 11/2/2006 By F.H. RAY.

REVISION 1 TO AWA 9 APPROVED BY: F.H. RAY FOR S. HUTCHINS AS SMDE.

END OF AWA #9

REVISON 2 TO AWA #9

FOR BETTER ALARA PRACTICE: WATER LEVEL IN THE TROUGH AT "WILL BE MARKED ON THE REACTOR PEDESTAL WALL AT ONE LOCATION. A CAMERA WILL BE FIXED ON THE MARK TO FACILITATE MONITORING OF THE TROUGH WATER LEVEL WITH RESPECT TO THE LEVEL MARK ON THE PEDESTAL WALL. FINAL FIELD VERIFICATIONS WILL BE PERFORMED FOR WATER LEVEL AND DEPTH. RESULTS OF THE FIELD TEST WILL BE DOCUMENTED IN THE W.O. CREM FOR ACCEPTANCE.

THIS REVISION OF THIS AWA DOES NOT AFFECT ANY IN SERVICE EQUIPMENT. THIS AWA IS GIVEN TO TOM BADDER OF VENTURE.

PREPARED BY S. MARKOS REVIEWED BY: JOHN A. CAMIRE APPROVED BY SMDE: S. HUTCHINS

DURING 11R, TWO TRENCHES WERE CUT FROM THE CONCRETE LOOR WHERE IT MEETS THE DRYWELL SHELL TO EVALUATE HELL THICKNESS AND TO REMOVE PLUG SAMPLES IN BAYS 5 AND 17. AFTER EVALUATION AND REPAIR, THE SHELL WAS SPRAY COATED IN THE TRENCH AREAS, FILLED UP WITH DOW CORNING 3-6548 SILICONE RTV FOAM AND SEALED AT THE TOP BY POURING A PROTECTIVE SEALING LAYER OF PROMATEC LOW DENSITY SILICONE ELASTOMER. IT WAS EVIDENT AFTER A 12R PAGE 0013

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

1.

APPROVED DISPOSITION:

INSPECTION OF THE AREA, THAT WATER WAS SEEPING INTO THE PROBABLE SOURCES OF WATER MAY BE (A): TRENCHES. VARIOUS COMPONENT (E.G. VALVE) LEAKAGES, (B): SPILLS FROM DRAIN TANKS, AND (C): EXCESS WATER FROM OUTAGE ACTIVITIES (E.G. CRD CHANGES). IN APRIL 1994, THE TRENCH AREAS WERE VISUALLY INSPECTED AGAIN WHEN A WALKDOWN WAS CONDUCTED DURING A FORCED OUTAGE. THE AREAS WERE FOUND TOTALLY DRY. DURING THE 1995 STRUCTURAL MONITORING INSPECTIONS NO SIGNS OF CORROSION OF THE INNER SURFACE OF EXPOSED STEEL SHELL IN THE TRENCHES WAS FOUND. THE PRESENCE OF WATER IN THE TRENCHES WAS OBSERVED IN 16R REFUELING OUTAGE IN 1997. IN THE 17R REFUELING OUTAGE, NO SIGN OF WATER WAS OBSERVED IN THE TRENCHES. IN THE 18R REFUELING OUTAGE DRYWELL INSPECTION THERE IS NO MENTION OF WATER PRESENCE IN THE TRENCHES.

DURING 1R21, WATER WAS DISCOVERED IN THE TRENCH IN BAY THIS WATER WAS VACUUMED OUT, BUT THE TRENCH SOON 5. REFILLED INDICATING THAT WATER WAS CONTAINED IN OR AROUND THE SLAB. THE FLOOR SLAB IS POURED AGAINST THE OTTOM OF THE DRYWELL SHELL. CHEMICAL ANALYSIS OF ATER SAMPLES SHOWED THAT THE WATER IS NEUTRAL TO WEAK BASIC. WHEN THE PLANT IS AT POWER THE DRYWELL IS INERTED WITH NITROGEN. LACK OF OXYGEN AND NEUTRAL TO WEAK BASIC WATER DO NOT FORM AN AGGRESSIVE ENVIRONMENT THAT COULD LEAD TO CORROSION OF THE DRYWELL STEEL THIS HAS BEEN CONFIRMED WITH VISUAL INSPECTION SHELL. OF THE INNER SURFACE OF THE DRYWELL EXPOSED SHELL IN THE AREA OF THE TRENCHES. THE ABOVE OBSERVATION INDICATES THAT (A): PROMATEC LDSE IS NO LONGER ACTING AS A SEAL TO PREVENT INTRUSION OF SURFACE WATER, AND (B): DOW CORNING RTV FOAM IS RETAINING THE WATER REACHING THE TRENCHES.

THE POTENTIAL SOURCES OF THE WATER ARE DIRECT LEAKAGE INTO THE FLOOR-TO-SHELL GAP DUE TO STANDING WATER ON THE FLOOR OR WATER RUNNING DOWN THE INTERIOR OF THE DRYWELL SHELL. IN ADDITION THE WATER COULD ALSO BE TRAVELING THROUGH CRACKS OR CONSTRUCTION JOINTS IN THE CONCRETE SLAB, COMING FROM THE TROUGH AROUND THE INNER FACE OF THE REACTOR PEDESTAL, OR FROM THE 1-8 SUMP IF HOLES EXIST IN THE SUMP LINER.

INSPECTION OF THE SUMP LINER SHOWS THAT IT IS IN GOOD NONDITION WITH NO HOLES. THEREFORE THE SUMP IS NO ONGER CONSIDERED AS A POSSIBLE SOURCE FOR THE WATER.

AFTER REMOVING DEBRIS FROM TROUGH AROUND THE INNER FACE OF THE REACTOR PEDESTAL (PER AWA #1) A VOID WAS FOUND IN CONCRETE IN THE BOTTOM OF THE TROUGH (IR 00550437). IT IS POSSIBLE THAT THIS VOID ALLOWS WATER TO BYPASS

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

THE TROUGH ROUTING ARRANGEMENT TO THE 1-SUMP AND ALLOWS WATER TO ENTER THE CONCRETE FLOOR AND MIGRATE THROUGH CRACKS OR CONSTRUCTION JOINTS TO THE TRENCH IN BAY 5. AS A RESULT AWA # 7 WAS ISSUED TO THE FIELD TO REPAIR THIS VOID AND ELIMINATE THIS LEAKAGE SOURCE INTO THE CONCRETE FLOOR.

1.2-SCOPE:

THIS ECR THEREFORE ADDRESSES SEVERAL TOPICS:

1.2.1-THE GAP BETWEEN THE DRYWELL SHELL AND THE CONCRETE FLOOR SHALL BE CAULKED AT THE INTERFACE.

1.2.2-THE GAP BETWEEN THE DRYWELL SHELL AND THE TRENCH SIDES SHALL BE CAULKED AT THE INTERFACE.

1.2.3-THE EXISTING TRENCH IN BAY 5 IS EXCAVATED FURTHER TO DETERMINE THE CONDITION OF THE DRYWELL SHELL IN THAT AREA. ACTIONS ARE SPECIFIED FOR FINISHING THE TRENCH SURFACES AFTER THE UT INSPECTIONS ARE COMPLETED.

2.4- INSTRUCTIONS FOR CLEANING AND INSPECTION OF THE DRYWELL SUMP WERE PROVIDED UNDER AWA #2 TO DETERMINE IF ANY REPAIRS ARE REQUIRED. THE RESULTS WILL BE FORWARDED TO ENGINEERING FOR EVALUATION UNDER THE STRUCTURAL MONITORING PROGRAM.

1.2.5-THE TROUGH INSIDE OF THE SUB-PILE ROOM (THE AREA INSIDE OF THE PEDESTAL AT ELEVATION 10'-3") AND THE PIPES THAT CONNECT IT TO THE AREA OUTSIDE OF THE PEDESTAL AND THE SUMP WERE INSPECTED UNDER AWA #1. THE RESULTS INDICATED THAT CONCRETE REPAIRS ARE NEEDED AROUND THE PIPES CONNECTING THE TROUGH TO THE SUMP, THE AREA OUTSIDE OF THE SUB-PILE ROOM, AND THE VOID IN THE TROUGH. THEREFORE THESE REPAIRS ARE ADDRESSED IN THIS ECR.

1.2.6-THE TROUGH INSPECTION ALSO IDENTIFIED LOW POINTS IN THE TROUGH. ACCEPTANCE OF THESE LOW POINTS WITHOUT ACTION IS JUSTIFIED IN THIS ECR.

1.2.7-INSPECTIONS IN THE SUB-PILE ROOM REVEALED THAT THE RAISED FLOOR SLAB IS DEGRADED, WITH EXPOSED GGREGATE. THIS CONDITION IS ADDRESSED IN THIS ECR, INCLUDING JUSTIFICATION FOR CONTINUED OPERATION UNTIL REPAIRS ARE DETERMINED AND IMPLEMENTED DURING A FUTURE REFUELING OUTAGE, IF DESIRED (SEE ATTACHED DESIGN ATTRIBUTES).

NUMBER: <u>OC 06-00879 000</u>

ECR TYPE: _DCP

11

APPROVED DISPOSITION:

1.3 ECR TYPE AND CLASSIFICATION: BASED ON "NO" ANSWERS TO SOME OF THE SCREENING QUESTIONS OF CC-AA-103 ATTACHMENTS F AND G, THIS ECR IS CLASSIFIED AS A DESIGN CHANGE PACKAGE. SAFETY RELATED SSC'S ARE AFFECTED.

1.4 TECHNICAL TASK RIGOR/RISK ASSESSMENT: A TECHNICAL TASK RIGOR/RISK ASSESSMENT WAS PERFORMED PER HU-AA-1212. THE INITIAL BRIEF FOR THIS TASK WAS CONDUCTED ON 10/18/06. FOR THE TASK OF DETERMINING THE SOURCE AND CONSEQUENCES OF THE WATER (ADDRESSED IN A2152754 E06, NOT IN SCOPE OF THIS ECR), A RISK RANK OF 2 WAS DETERMINED. AN EVALUATION TEAM OF MULTIPLE SME'S WAS ASSEMBLED, AND IT WAS DETERMINED THAT AN INDEPENDENT THIRD PARTY REVIEW WAS REQUIRED. THE SCOPE OF THIS ECR IS TO IMPLEMENT THE RESOLUTIONS OF THAT TECHNICAL TASK. FOR THE SCOPE OF THIS ECR, A RISK RANK OF 3 WAS DETERMINED. THEREFORE THIS ECR REQUIRES AN ON-SITE INDEPENDENT THIRD PARTY REVIEW.

2.0 SOLUTION / TECHNICAL EVALUATION:

.1 DESIGN CHANGE ATTRIBUTES:

DESIGN CHANGE ATTRIBUTES AND INPUTS HAVE BEEN REVIEWED PER ATTACHMENT 1A OF CC-AA-102, AND ADDITIONAL GUIDANCE PROVIDED IN ATTACHMENT 1 OF CC-MA-102-1001. THIS REVIEW IS PROVIDED IN ATTACHMENT 1 OF THIS ECR.

2.2 CONFIGURATION ACTIVITIES IMPACT REVIEW: CONFIGURATION CONTROL ACTIVITIES HAVE BEEN REVIEWED IN ACCORDANCE WITH THE REQUIREMENTS OF ATTACHMENT 7 OF CC-AA-102 AND ADDITIONAL GUIDANCE PROVIDED IN ATTACHMENT 7A OF CC-MA-102-1001. THIS REVIEW IS DOCUMENTED IN ATTACHMENTS 1 AND 2 OF THIS ECR.

2.3 PROGRAM IMPACT REVIEW

PROGRAM ACTIVITIES HAVE BEEN REVIEWED IN ACCORDANCE WITH THE REQUIREMENTS OF ATTACHMENT 8 OF CC-AA-102 AND ADDITIONAL GUIDANCE PROVIDED IN ATTACHMENT 8A OF CC-MA-102-1001. THIS REVIEW IS DOCUMENTED IN ATTACHMENTS 1 AND 2 OF THIS ECR.

2.4 SOLUTION:

THE REPAIRS SPECIFIED UNDER THIS ECR ARE INTENDED TO CONTROL WATER FLOW IN THE BOTTOM OF THE DRYWELL. LTHOUGH DETERMINED TO BE ACCEPTABLE IN A2152754 E06*, T IS DESIRABLE TO MINIMIZE THE AMOUNT OF WATER IN THE PORES AND SMALL SPACES IN AND AROUND THE DRYWELL CONCRETE FLOOR SLAB AT ELEVATION 10'-3". TO DO THIS, THE SUMP HAS BEEN INSPECTED AS DIRECTED IN AWA #2 TO MINIMIZE ITS POTENTIAL AS A SOURCE OF LEAKAGE INTO THE SLAB. VT-1 INSPECTION OF THE SUMP SHOWS THAT THE

NUMBER: <u>OC 06-00879 000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

STAINLESS STEEL LINER IS IN GOOD CONDITIONS AND HAS NO HOLES. THEREFORE THIS SOURCE OF THE LEAKAGE IS ELIMINATED AS A LEAKAGE SOURCE, (A2152754-13).

THE TROUGH AREA HAS ALSO BEEN INSPECTED, AND WILL BE REPAIRED AS REQUIRED TO DIRECT FLOW TO THE SUMP (BY REPAIRING THE CONCRETE AROUND THE PIPES). 'AFTER REMOVING DEBRIS FROM TROUGH AROUND THE INNER FACE OF THE REACTOR PEDESTAL (PER AWA #1) A VOID WAS FOUND IN THE CONCRETE IN THE BOTTOM OF THE TROUGH (IR 00550437). THIS VOID MAY ALLOW WATER TO BYPASSES THE TROUGH ROUTING ARRANGEMENT TO THE 1-8 AND ALLOWS WATER TO ENTER THE CONCRETE FLOOR, WHICH ALLOWS WATER TO ENTER THE CONCRETE FLOOR, WHICH ALLOWS WATER TO MIGRATE THOUGH CRACKS AND CONSTRUCTION JOINTS IN THE FLOOR TO THE TRENCH IN BAY 5. AS A RESULT AWA # 7 WAS ISSUED TO REPAIR THIS VOID AND ELIMINATE THIS LEAKAGE SOURCE INTO THE CONCRETE FLOOR. THE REPAIR OF THE TROUGH SHOULD ELIMINATE THE LEAKAGE SOURCE, WHICH CONTINUES TO FILL THE BAY 5 TRENCH.

IN ADDITION, THE PERIMETER OF THE SLAB WILL BE CAULKED THE STEEL VESSEL TO PREVENT WATER FROM ENTERING THE AP AT THIS INTERFACE. THESE REPAIRS SHOULD ELIMINATE MOST OF THE FLOW PATHS INTO THE SLAB AREA.

THE TRENCH AT BAY 5 WILL BE EXCAVATED SEVERAL INCHES DEEPER TO ALLOW FOR FURTHER UT INSPECTION OF THE DRYWELL SHELL. AFTER THIS, THE NEW CONCRETE EDGES AGAINST THE STEEL SHELL WILL BE CAULKED AND THE STEEL SHELL EXPOSED AREA WILL BE COATED. THE DEGRADATION OF THE RAISED SLAB IN THE SUB-PILE ROOM, AND THE LOW POINTS IN THE TROUGH DO NOT SIGNIFICANTLY AFFECT THE CONTROL OF WATER IN THIS AREA. THEREFORE NO REPAIRS ARE REQUIRED FOR THESE CONDITIONS AT THIS TIME.

2.5 TECHNICAL EVALUATION: THE DESIGN SOLUTIONS ARE EXPLAINED HERE, AND SUPPORTED BY THE ATTACHED DESIGN ATTRIBUTES.

WATER HAS BEEN FOUND IN THE TRENCHES OF THE 10'-3" DRYWELL FLOOR SLAB DURING SEVERAL PAST INSPECTIONS. AS JUSTIFIED IN A2152754 E06* (SEE NOTE AT END OF D.A.R.),

THE PRESENCE OF THIS WATER IS NOT DETRIMENTAL TO THE STEEL DRYWELL SHELL. HOWEVER, CAULK WILL BE INSTALLED T THE INTERFACE BETWEEN THE CONCRETE AND THE DRYWELL HELL TO MINIMIZE THE AMOUNT OF WATER ENTERING THE GAP BETWEEN THE CONCRETE SLAB AND THE SHELL. THE CAULK WILL FOLLOW THE CONTOUR OF THE EDGE OF THE CONCRETE ALONG THE STEEL SHELL, GOING UP AND DOWN THE CHANGES IN CURB ELEVATION AND INTO THE DEPRESSIONS OF THE TRENCHES. THE CAULK DOES NOT INCREASE THE AMOUNT OF

NUMBER: <u>OC</u> <u>06-00879</u> 000

ECR TYPE: DCP

APPROVED DISPOSITION:

MATERIAL POTENTIALLY FOULING THE SUCTION STRAINERS BECAUSE A GREATER AMOUNT OF MATERIAL (SILICONE FOAM AND ELASTOMER) WAS REMOVED FROM THE TRENCHES AND IS NOT BEING REPLACED, REFER TO TECHNICAL EVALUATIONS A2152754-05 AND A2152754-12 FOR ASSESSMENT OF THE IMPACT ON THE SUCTION STRAINERS

THE TRENCH IN BAY 5 WAS EXCAVATED APPROXIMATELY 6" DEEPER TO EXPOSE THE DRYWELL SHELL FOR ACCESS FOR UT MEASUREMENTS. THE MINOR AMOUNT OF CONCRETE REMOVED HAS NO IMPACT ON THE STRUCTURAL INTEGRITY OF THE SLAB SINCE THE SLAB IS PRINCIPALLY A FILL LAYER TO PROVIDE A LEVEL FLOOR (EXCEPT FOR BEARING DIRECTLY UNDER THE PEDESTAL).

THE CONCRETE REMOVED IS A PORTION OF THE REMAINING THIN WEDGE AT THE BOTTOM OF THE TRENCH, BETWEEN THE (RELATIVELY) FLAT BOTTOM OF THE TRENCH AND THE SLOPED SHELL SURFACE. NO REINFORCING OR STRUCTURAL STEEL IS AFFECTED. THE STEEL SHELL REMAINS INTACT AS THE CONTAINMENT BOUNDARY. THE NEWLY EXPOSED DRYWELL VESSEL WAS UT INSPECTION RESULTS SHOW THE VESSEL THICKNESS IS LOSE TO NOMINAL THICKNESSES.

THE NEW EDGE OF THE CONCRETE WILL BE CAULKED TO THE STEEL SHELL TO MAINTAIN

THE CONTINUITY OF THE CAULK BARRIER. THE STEEL WILL BE COATED WITH GREASE AS DESCRIBED IN SECTION 3.2.2.4.3 OF SPECIFICATION IS-328227-004 REV. 13, TO PREVENT CORROSION OF ANY AREAS THAT ARE NOT COATED WITH THE NORMAL ZINC BASED COATING. REMOVAL OF THE SILICONE FOAM AND ELASTOMER FROM THE TRENCHES HAS NO IMPACT ON THE FLOOR SLAB OR THE STEEL SHELL. WATER WAS FOUND IN THE TRENCHES UNDER THE SILICONE MATERIAL, SO THEY ARE NOT EFFECTIVE AS A WATER SEAL IN THIS APPLICATION. ANY WATER COLLECTING IN THE TRENCHES WILL NOT AFFECT THE STEEL DUE TO THE GREASE APPLIED, AND THE CONCRETE IS NOT DETRIMENTALLY IMPACTED BY CONTACT WITH THE WATER.

IN THE TROUGH AREA, THE CONCRETE WAS FOUND TO BE DEGRADED AROUND SEVERAL PIPES. THE TWO PIPES TO THE SUMP WERE FOUND TO HAVE VOIDS AND LOOSE MATERIAL UNDER THEM ON THE TROUGH SIDE, AS WAS THE AZIMUTH 270 PIPE FROM OUTSIDE OF THE SUB-PILE ROOM TO THE TROUGH. THESE THREE AREAS WILL BE RESTORED TO THEIR ORIGINAL CONFIGURATION USING SAFETY RELATED MASTERFLOW 928 ROUT, WHICH IS AS STRONG OR STRONGER THAN THE ORIGINAL DNCRETE.

IN ADDITION, AFTER REMOVING DEBRIS FROM TROUGH AROUND THE INNER FACE OF THE REACTOR PEDESTAL (PER AWA #1) A VOID WAS FOUND IN CONCRETE IN THE BOTTOM OF THE TROUGH (IR 00550437). MOST LIKELY THIS VOID ALLOWS WATER TO

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

APPROVED DISPOSITION:

BYPASSES THE TROUGH ROUTING ARRANGEMENT TO THE 1-8 AND ALLOWS WATER TO ENTER THE CONCRETE FLOOR, WHICH ALLOWS WATER TO MIGRATE THOUGH FLOOR TO THE TRENCH IN BAY 5. AS A RESULT AWA # 7 WAS ISSUED TO THE FIELD TO REPAIR THIS VOID AND ELIMINATE THIS LEAKAGE SOURCE INTO THE CONCRETE FLOOR. THE REPAIR OF THE TROUGH SHOULD ELIMINATE THE LEAKAGE SOURCE, WHICH CONTINUES TO FILL THE BAY 5 TRENCH.

THE DEPTH OF THE TROUGH WAS MEASURED RELATIVE TO STANDING WATER IN THE TROUGH TO DETERMINE IF THE FLOOR OF THE TROUGH WAS SLOPED TO THE SUMP AREA. IT WAS FOUND THAT, GENERALLY, THE LOW POINT OF THE TROUGH IS AT THE SUMP (O DEGREES) AND THE HIGH POINT IS OPPOSITE THE SUMP (180 DEGREES). THE TROUGH IS RELATIVELY FLAT FROM 270 DEGREES TO 0 DEGREES, HAVING ONLY A 1/8" DIFFERENCE IN WATER DEPTH. THE FLOOR AND WALLS OF THE TROUGH WERE FOUND TO BE IN GOOD CONDITION, HAVING NO SIGNIFICANT CRACKS OR PATHS OF LEAKAGE INTO THE SLAB INTERIOR. BASED ON THIS INFORMATION, IT WAS DETERMINED THAT THERE WAS LITTLE BENEFIT TO RESURFACING THE TROUGH LOOR TO PROVIDE A CONTINUOUS PITCH TO THE SUMP. TANDING WATER IN THE TROUGH DOES NOT AFFECT THE CONCRETE. ALSO, RAISING THE FLOOR OF THE TROUGH IN THE 270 DEGREE REGION COULD CAUSE WATER TO COLLECT OUTSIDE OF THE PEDESTAL IN THAT AREA, OR EVEN FLOW OUT OF THE TROUGH TO THE OUTER AREA THROUGH THE PIPE THAT CONNECTS THE TWO AREAS. THEREFORE, BASED ON THERE BEING NO TANGIBLE BENEFIT AND POTENTIAL NEGATIVE CONSEQUENCES. NO REPAIRS ARE SPECIFIED FOR THE TROUGH FLOOR OR WALLS.

THE RAISED SLAB IN THE CENTER OF THE SUB-PILE ROOM HAS EXPOSED AND LOOSE AGGREGATE, AND SPALLING ALONG THE EDGE IN A FEW PLACES. THIS SLAB IS PITCHED DOWNWARD FROM THE CENTER POINT IN ORDER TO SHED WATER INTO THE TROUGH. THERE IS NO STRUCTURAL FUNCTION OF THE RAISED PORTION OF THE SLAB OTHER THAN TO PROVIDE A WORKING SURFACE FOR UNDER VESSEL WORK. THE DISLODGED AND LOOSE AGGREGATE AND DEBRIS HAS BEEN REMOVED, SO THERE IS NO CURRENT CONCERN WITH THE CONDITION. FUTURE REPAIRS SHOULD BE CONSIDERED TO PREVENT FURTHER DEGRADATION AND CREATION OF DEBRIS. THEREFORE THE DEGRADED CONDITION OF THE SLAB IS ACCEPTABLE AT THIS TIME, AND NO REPAIRS ARE SPECIFIED.

.0 10CFR50.59 REVIEW:

THIS ECR IS DETERMINED TO BE A DCP-TYPE PER CC-AA-103. AS SUCH, A 50.59 REVIEW IS REQUIRED. 50.59 SCREENING OC-2006-S-0379 HAS BEEN PERFORMED PER LS-AA-104 FOR THIS CONFIGURATION CHANGE. THE 50.59 SCREENING CONCLUDES THAT A 50.59 REVIEW IS NOT REQUIRED AND THAT

ECR TYPE: DCP

11

APPROVED DISPOSITION:

PRIOR NRC APPROVAL IS NOT REQUIRED TO IMPLEMENT THIS CONFIGURATION CHANGE.

4.0 PLANNING, INSTALLATION AND TESTING INSTRUCTIONS:

4.1 PLANT MODE(S) APPLICABILITY:

THIS DESIGN CHANGE PACKAGE REQUIRES INSTALLATION OF MATERIALS IN THE DRYWELL. THEREFORE THIS MODIFICATION MUST BE INSTALLED AND INSPECTED DURING THE 1R21 OUTAGE.

4.2 INSTALLATION REQUIREMENTS:

4.2.1 GENERAL

4.2.1.1 WORK WILL BE IN A POSTED HIGH RAD AREA. AN ALARA PLAN MUST BE DEVELOPED FOR THE REQUIRED WORK ACTIVITIES.

4.2.1.2 THE MIXING AND PLACEMENT OF GROUT SHALL BE IN ACCORDANCE WITH 2400-SMM-3150.16 AND THE MANUFACTURER'S NSTRUCTIONS. A QV QUALIFIED INSPECTOR MUST WITNESS HE MIXING AND PLACEMENT OF THE GROUT.

4.2.1.3 THE MIXING OF THE CAULKING MATERIALS AND PLACEMENT MUST BE IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS AND THIS ECR, AND BE WITNESSED BY QV QUALIFIED INSPECTOR.

4.2.2 REPAIRS IN SUB-PILE ROOM (AREA INSIDE OF THE PEDESTAL)

4.2.2.1 LOOSE DEBRIS AND EASILY DISLODGED AGGREGATE SHOULD BE REMOVED FROM THE TROUGH AND THE RAISED FLOOR SLAB.

4.2.2.2 GROUT REPAIR IS REQUIRED AT THE TWO PIPES FROM THE TROUGH TO THE SUMP, AND AT THE AZIMUTH 270 PIPE THROUGH THE PEDESTAL WALL TO THE TROUGH, AS DESCRIBED IN AWA #1. IN ADDITION THE VOID SHALL BE REPAIRED PER AWA #7.

4.2.2.3 ENSURE THAT LOOSE MATERIAL IS REMOVED AND CLEAN AGGREGATE IS EXPOSED PRIOR TO INSTALLATION OF THE REPAIR GROUT, IN ACCORDANCE WITH PROCEDURE 2400-SMM-150.16.

4.2.2.4 THE DRYWELL SUMP LINER SHOULD BE CLEANED AND INSPECTED AS DESCRIBED IN AWA #2, WITH ANY UNSATISFACTORY RESULTS BEING REPORTED TO ENGINEERING FOR CONSIDERATION OF REPAIRS AND BEING TRACKED UNDER A2152754-13.

NUMBER: <u>OC</u> 06-00879 000

ECR TYPE: DCP

PAGE 0021

APPROVED DISPOSITION:

4.2.3 CAULKING THE ELEVATION 10'-3" SLAB PERIMETER

4.2.3.1 THE STEEL AND CONCRETE SURFACES SHOULD BE PREPARED AS DESCRIBED IN AWA #3. LOOSE COATINGS, DIRT, DEBRIS AND CONTAMINANTS MUST BE REMOVED PRIOR TO CAULKING. SURFACE CONDITIONS SHOULD MEET MANUFACTURERS INSTRUCTIONS FOR CAULK PLACEMENT.

4.2.3.2 CAULK SHALL BE APPLIED TO THE FULL PERIMETER OF THE SLAB, AT ITS INTERFACE WITH THE STEEL SHELL, AS DESCRIBED IN AWA #5 AND MODIFIED BY AWA #6 FOR USE OF BACKER ROD.

4.2.3.3 NOTE THE QV INSPECTIONS REQUIRED BY THE AWA, AND THE REVISION TO AWA #5 REDUCING THE MAXIMUM LAP OF THE CAULK ONTO THE STEEL AND CONCRETE TO 3/4".

4.2.4 TRENCH EXCAVATION AND RESTORATION

4.2.4.1 THE TRENCH IN BAY 5 SHALL BE FURTHER EXCAVATED 5 DESCRIBED IN AWA #4.

4.2.4.2 AFTER COMPLETION OF UT EXAMINATIONS, CAULK CAN BE APPLIED AT THE INTERFACE WITH THE STEEL SHELL AND THE CONCRETE PER SECTION 4.2.3. REMOVE ALL STANDING WATER FROM THE TRENCH AND ALLOW THE SURFACES TO DRY SUFFICIENTLY TO ALLOW THE APPLICATION OF THE GROUT. CONDITIONS MAY NOT ALLOW FOR A COMPLETE DEWATERING OF THE TRENCH AND DRYING OF ALL SURFACES. IN THIS CASE APPLY A MINIMUM APPLICATION OF GROUT TO THESE SURFACES AND ALLOW 8 HOURS FOR IT TO DRY. ONCE DRY APPLY THE CAULK.

.4.2.4.3 RECOAT THE DRYWELL SHELL SURFACE IN BOTH THE BAY 5 AND BAY 17 TRENCHES AS DESCRIBED IN SECTION 3.2.2.4.3 OF SPECIFICATION IS-328227-004 REV. 13.

4.2.4.4 DO NOT REINSTALL THE SILICONE FOAM OR ELASTOMER TOPPING IN THE TWO TRENCHES.

4.3 ACCEPTANCE TESTING:

4.3.1 GROUT REPAIRS - LEAK TEST WILL BE PERFORMED TO ENSURE ADEQUATE REPAIRS AS DETAILED IN AWA #9. THE LEAK TEST IS USED AS A POST MAINTENANCE VERIFICATION.

.3.2 CAULKING - AN ISI PRE-SERVICE INSPECTION (PSI) WILL BE PERFORMED ON THE CAULK. SUCCESSFUL COMPLETION OF THIS VISUAL EXAMINATION PROVIDES SATISFACTORY ACCEPTANCE TESTING FOR THIS INSTALLATION.

4.3.3 TRENCH EXCAVATION/RESTORATION - ACCEPTANCE

NUMBER: OC 06-00879 000

ECR TYPE: DCP

APPROVED DISPOSITION:

TESTING FOR THIS PORTION OF THE WORK IS A VISUAL VERIFICATION BY THE WORK GROUP THAT ALL STEEL SHELL SURFACE AREA IN THE TRENCHES IS COATED, EITHER WITH THE ORIGINAL ZINC BASED COATING OR THE GREASE SPECIFIED IN THIS ECR.

4.4 MATERIALS:

204-04825 MASTERFLOW 928 GROUT (PC1) 204-07780 BACKER ROD POLYSPEC THIOKOL 2235M CAULK

IND. DESIGN REVIEW COMMENTS:

STRUCTURAL TECHNICAL REVIEW WAS PERFORMED BY DAN FIORELLO I PERFORMED A REVIEW OF THE WORD DOCUMENT CONTAINING THE PROBLEM RESOLUTION, I REVIEWED THE AWAS AND THE TECHNICAL EVALUATION OF THE DESIGN CHANGE AND AM IN AGREEMENT WITH THE CHANGES. I ALSO REVIEWED THE DESIGN ATTRIBUTES IN ATTACHMENT 1. MY COMMENTS WERE MINOR AND WERE INCOPORATED INTO THE DOCUMENT

INDEPENDENT REVIEW BY PETE TAMBURRO

I HAVE REVIEWED THE ATTACHED ECR IN ACCORDANCE ITH CC-AA-103 ATTACHMENT D. HE ECR DESIGN INPUTS ARE CORRECT. ALL ASSUMPTIONS ARE REASONABLE. THE APPROPRAITE QUALITY ASSURANCE REQUIREMENTS HAVE BEEN SPECIFIED. ALL DESIGN INTERFACE REQURIEMENTS ARE MET. THE INSTALLED CAULK

HAS BEEN QUALIFIED. ADEQUATE MAINTENANCE AND

NUMBER: <u>OC</u> <u>06-00879</u> <u>000</u>

ECR TYPE: DCP

IND. DESIGN REVIEW COMMENTS:

INSPECTION FEATURES HAVE BEEN ADDRESSED. RADIATION EXPOSURE HAS BEEN CONSIDERED. ALL RECORD RETENTION AND APPROVAL REQUIREMENTS HAVE BEEN ADDRESSED. THEREFORE I RECOMMEND APPROVAL OF THIS ECR.

ALL COMMENTS RECEIVED FOR THE THIRD REVIEWER HAS BEEN SATISFACTORY RESOLVED AS DOCUMENTED IN EMAIL DATED 10/28. SIGNED FOR ELDRIDGE, SHARON DUE TO PIMS INACCESSIBILITY.

AWA 1 THROUGH 9 INCLUDING REVISIONS WHICH WERE REQUIRED TO IMPLEMENT AND CORRECT THE IDENTIFIED DISCREPANCIES HAVE BEEN REVIEWED AGAINST THE FINAL DISPOSITION AND ALL REVIEWER COMMENTS REMAIN VALID. THIS PACKAGE ALSO RECIEVED A FINAL INDEPENDENT THIRD PARTY REVIEW BY MPR ASSOCIATES AND WAS FOUND ACCEPTABLE WITHOUT REVISION.

MANAGERS COMMENTS

THIS DCP IS APPROVED FOR USE. THIS MODIFICATION WILL IMPROVED THE HEALTH OF THE DRYWELL AND CONCRETE TO ISURE THAT THE PHYSICAL PLANT IS KEPT HEALTHY THROUGH IFE EXTENSION.

Operations Department (including Radwaste) Configuration Change Review Checklist

Page 1 of 1

Configuration Change Document No.: ECR 06-00879 Rev. 0

This Attachment is a sample of a format that can be used to obtain InterDepartmental approvals of a Configuration Change. The content of the Attachment is the required level of questions that each department is expected to answer and provide concurrence before Engineering issues the Configuration Change. As long as the content of the Attachment is being addressed, there is no requirement to use this particular format. This review covers activities performed during the design phase of a Configuration Change, including initial meetings, walkdowns, detailed design development, and identification of impacts on other station programs and areas of responsibility.

Review Requirements

1. The impact on the station equipment, changes in equipment responses, and changes in operator response for different scenarios have been discussed. As the representative of the Operations Department, I fully understand the impact, including training needs, upon my department and concur that my concerns have been adequately addressed.

2. I have confirmed the identified Programs, Procedures and Training requirements are complete, or initiated tracking for completion, for my department in accordance with CC-AA-102 attachments listed below:

> Attachment 7 - Configuration Activities (List Tracking No. None

Attachment 8 – Programs (Tracking No. None

- Attachment 9 Procedures and Training (Tracking No. Nun-)
- 3. Acceptance criteria for Post Maintenance Testing and any special tests required to adequately demonstrate system operability following implementation of a Configuration Change have been specified.
- 4. ALARA for operation has been considered in the design.
- 5. Appropriate component labeling is used in the design package, including drawings.
- 6. The Configuration Change does not interfere with operation of existing nearby equipment.
- 7. There are no operating procedure changes required by this Configuration Change that introduce new susceptibility to water hammer or hydraulic transients that might result in impacting plant operation.
- 8. The design can be implemented within constraints of plant operation/mode. This includes an operation assessment of all affected systems and interfacing structures, systems and components during the mode(s) in which the design change is being implemented.

9. The configuration change has been reviewed and will not introduce a new single point of vulnerability and there are no existing SPVs (unless approved by Site Engineering Director)

- 10. Impact of this configuration change on Operator Aids has been reviewed and appropriate actions have been or will be taken (refer to OP-AA-115-101 and the Operator Aid Log) Mone
- 11. The configuration change has been reviewed and impacts on margin are understood. The design summary adequately addresses known margin impacts. (refer to ER-AA-2007)
- 12. Changes impacting the Clearance and Tagging Program have been identified and are being tracked.

My department has reviewed the Configuration Change Document (or appropriate contents) and understands the impact regarding my department's operations, procedures, and programs. All Configuration Change support activities required of my department have been identified.

1. My department has participated as required, and concurred with the proposed Configuration Change: and fully understands the Configuration Change implications for my department. Included in this review is verification that restoration activities will not result in hydraulic transients that could result in water hammer or affect the continued operation of the unit

2. I have confirmed the identified Programs, Procedures and Training requirements are complete, or initiated tracking for completion, for my department in accordance with CC-AA-102 attachments listed below: ECR 06-00879

Attachment 7 - Configuration Activities (Tracking No. A Z/JZ7 54)

Attachment 8 - Programs

(Tracking No.____

Attachment 9 – Procedures and Training (Tracking No.

- 3. Acceptance criteria for DCP Testing and any special tests required to adequately demonstrate system operability following Configuration Change implementation have been specified.
- 4. Parameters for performance monitoring and trending are adequately instrumented.
- 5. If applicable, changes to system descriptions in UFSAR and DBDs have been reviewed and are correct.
- 6. Existing Surveillance Procedures are adequate for monitoring system performance or revision are being tracked to assure timely completion. (Action Tracking No._
- 7. PMs are not impacted or actions initiated to create or revise PM's
- 8. New components are classified per MA-AA-716-210 in the PCM web-based tool, appropriate revisions in the PCM web-based tool for existing components have been made, or additions and changes are being tracked to assure timely completion. (Action Tracking No.
- 9. Design conditions, inputs, and assumptions used in processes, designs or analyses subject to Nuclear Fuels Dept. design authority, if affected, have been discussed with NF and addressed if reg'd.
- 10. The configuration change has been reviewed and will not introduce a new single point of vulnerability and there are no existing SPVs. (unless approved by Site Engineering Director)
- 11. Changes to operator rounds data points have been initiated per OP-AA-102-102. (Action Tracking) No.
- 12. The configuration change has been reviewed and impacts on margin are understood. The design summary adequately addresses known margin impacts. (refer to ER-AA-2007)

13. Determine if the interim configuration has any potential impact on the operational and nuclear safety requirements of all affected systems and interfacing structures, systems and components during the mode(s) in which the design change is being implemented.

My department has reviewed the Configuration Change Document (or appropriate contents) and understands the impact regarding my department's operations, procedures, and programs. All Configuration Change support activities required of my department have been identified.

RADIATION RESISTANCE OF LP® LIOUID POLYSULFIDE POLYMER BASED COMPOUNDS

INTRODUCTION

Several independent test laboratory studies have been conducted on the radiation resistance of LP® liquid polysulfide based compounds. In one study, an LP liquid polysulfide based compound withstood gamma radiation doses up to 6.6 x 107 roentgens, for a period of seven days, with little degradation to physical properties. In a second study, specially formulated LP liquid polysulfide based compounds immersed in JP-4 jet fuel withstood as much as 1.7 x 10° roentgens, with only a small loss in physical properties. Both studies showed that commercially available LP liquid polysulfide polymer base aircraft sealants formulated to meet Federal Specifications MIL-S-7502C and MIL-S-8802C had the best resistance to radiation.

DISCUSSION OF RADIATION RESISTANCE DATA FROM OTHER REPORTS

One report which contains radiation data is entitled, "Research on Elastomeric and Compliant Materials for Aerospace Sealants", Technical Documentary Report No. ASD-TDR-62-709. In this study, eight different polymer based sealants, which were all proprietary sealants, were evaluated and compared. Of those sealants tested, the LP liquid polysulfide based sealants gave the best resistance to gamma radiation. In testing the LP liquid polysulfide based sealant compounds for radiation resistance, three different curing agents were used. The best radiation and heat resistance results obtained were on those LP polysulfide polymer compounds which used either the chromate^{*} or MnO₂ cure as compared to the PbO₂ cure. The best results obtained in this study were on an LP liquid polysulfide polymer based compound that withstood gamma radiation doses of 6.4 x 10⁶ roentgens at temperatures of 190°F for 16 hours. After 100 hours at 250°F, this compound was still serviceable although some degradation was evident.

A second report that contains considerable radiation data on various sealant systems is entitled, "The Effects of Reactor Radiation on Elastomers and Sealants-III", by L. L. Morgan. This is Document No. NARF-60-37T, and is also listed as ASTIA No. 256,689. In this study, a number of proprietary compounds, as well as compounds prepared by Thiokol, were evaluated against a number of combined environments. The maximum gamma dosage which LP liquid polysulfide based sealants withstood, when exposed in air at 90°F, was 1.7 x 10⁵ roentgens. After this maximum gamma radiation exposure, the samples still exhibited tensile properties of 400 psi and elongation values of 265%.

*U.S. Patent No. 2,787,608 issued 4/2/57 to Products Research Company, Los Angeles, Cal. should be referred to before processing and marketing commercial products based on the chromate cure system.

The information in this builtetin is derived from the best available sources and is believed to be accurate. However, no guarantee is expressed or implied regarding the accuracy of these data of the use of this product, nor are any assembles in this builtetin intended to infringe on any parant.

P.8/16

In another test, cured tensile specimen samples of several LP liquid polysulfide polymer based sealant compounds were immersed in JP-4 fuel for seven days. Next, the samples received a gamma dose of 1.7×10^8 roentgens, after which they were left immersed in the JP-4 fuel for thirty more days. After completion of the exposure tests, the samples still exhibited a tensile strength of 350 psi and an elongation of 125%. The LP liquid polysulfide polymer based compounds used in these exposure tests were based on a chromate and MnO₁ cure system.

Refer to Table 1 for typical LP liquid polysulfide polymer based formulations and the physical and heat resistant properties of the cured compounds. Then, refer to Tables II and III for a summary of results on five cure systems and their correlation between radiation and heat resistance. All data in the following Tables was compiled from tests conducted by Convair, a division of General Dynamics, Fort Worth, Texas. Convair conducted all the irradiation studies on the test samples, which were prepared and supplied by Thiokol Chemical Corporation. Among the sealants formulated by Thiokol, it was established that cure systems exhibiting the best heat resistance also exhibited the best radiation resistance. Exposure to higher temperatures during irradiation indicated that heat alone can cause degradation.

Engineering Paper No. 893

THE EFFECT OF NUCLEAR RADIATION ON SEALANTS

Raymond A. Siebert

by

Process Engineer

Materials Research & Process Engineering

Douglas Aircraft Company, Inc.

This paper to be presented at the Society of Aircraft Materials and Process Engineers, Symposium on Sealants and Sealing Aircraft, Missiles, and Electrical Components, October 28, 1959, in the Institute of Aeronautical Sciences, 7660 W. Beverly Blvd., Los Angeles, California 1.1.C.6.1331 . 1.1CMI

In addition to the obvious thermal and mechanical effects of an atomic explosion, additional effects may result from exposure to high intensity nuclear radiation. An aircraft or missile which might survive the heat and shock wave of an atomic detonation could conceivably become disabled because of radiation effects on components of an essential system such as hydraulic controls or power plant. Recently, Douglas Aircraft Company had the opportunity to investigate the effects of nuclear radiation from an atomic explosion on various process materials used in the construction of aircraft and missiles. Included in the test materials were various sealants which were selected because of their general usage in the airframe and missile industry.

- 1. Material A is a polysulfide based MIL-S-8802 type jet fuel resistant integral fuel tank sealant which employs a chromate based accelerator.
- 2. Material B is a black, polysulfide based MIL-S-7502 type integral fuel tank sealant which utilizes a lead peroxide based accelerator.
- 3. Material C is a polysulfide based MIL-S-8516 type electrical potting compound which utilizes a lead peroxide based accelerator.
- 4. Material D is a room temperature curing silicone based sealant.
- 5. Material E is a heat curing silicone based sealant which is putty-like in consistency before cure.

Specimen Preparation

ECR 06-00879, K ATTACHMENT PAGE | OF 17

Test specimens were prepared from 1/8 inch thick sheets of cured sealant which had been milled to removed entrapped air immediately after addition of the accelerator. After the sheets had cured 7 days at $77 \pm 2^{\circ}F$, dumbbell specimens were cut using the die described in ASTM D-412-SIT as Die D. The resulting specimens measured 4 inches in length with a maximum width of 5/8 of an inch and a throat width of 1/8 of an inch. Since Material E, the heat curing silicone, was too viscous for air-free milling, 1/2 by 4 inch rectangular specimens were cut from a 1/8 inch thick sheet which had been pressed from a portion of the uncured compound.

Each specimen was then weighed to the nearest milligram and enclosed in a piece of 1100 aluminum (2S) tubing with an inside diameter of 3/4 of an inch and a length of S inches. The ends of the tubes were crimped closed and the sealants allowed to cure an additional 37 days at $77 \pm 20F$.

The specimens were then divided into 5 groups, with each group consisting of 3 specimens of each sealant. Each group, with the exception of the control group, was encased in a 6 inch aluminum sphere having a wall thickness of 1-1/2 inches in order to protect the specimens from thermal and mechanical damage. These speres were shipped to the test site where they were placed at varying distances from ground zero. The control specimens were maintained at 77 \pm 2°F. for the duration of the test.

-1-

Evaluation of Effects.

OCT.27.1997

Eighteen days after the detonation, the test specimens were removed from the aluminum tubes and checked for induced radioactivity. Only the polysulfide specimens - Materials A, B and C - which had been exposed at Positions 1 and 2 exhibited any measurable induced radioactivity, as shown in the Table of Results. All specimens including the controls were reweighed and per cent changes in weight calculated. There were no significant trends apparent in the weight changes except, perhaps, in Material E which will be discussed later.

All dumbbell specimens, with a total cure of 62 days, were tested for ultimate tensile strength and elongation properties at $77 \pm 2^{\circ}F$. using a Scott Tester, Model L equipped with Type Z-1 clamps and operating at a clamp separation rate of 2 inches per minute. All specimens of Material E were measured for hardness using a Rex Durometer, Model A.

As indicated in the Table of Results, there was no consistent pattern in either the ultimate tensile strengh or elongation of the exposed specimens compared to the controls. The exposed specimens of fuel tank sealants, Materials A and B, exhibited very slight increase in ultimate tensile strength but this increase was not proportional to the amount of radiation received by the various groups. The only consistent changes were observed in the hardness readings or exposed specimens of Material E, where a progressive increase in hardness with increasing proximity to ground zero was noted.

The changes in weight and hardness exhibited by the exposed specimens of Material E were possibly caused by increased temperatures as the specimens were situated closer to ground zero. However, if the temperature at Position 1 was sufficient to cure Material E to a hardness of 45-50, which normally requires 5 to 6 hours at 250°P., the specimens of Materials A, B and C at this position should have exhibited detectable signs of heat exposure, such as increased tensile strength or reduced elongation. Since there appeared to be no other evidence of heat effects, the changes exhibited by Material E were probably a result of bombardment by thermal neutrons whose energy effects may have been sufficient to polymerize the relatively low molecular weight silicone compound.

Generally, the sealants tested did not experience sufficient damage to impair their servicesbility at the levels of radiation involved in this test. Since an aircraft or missile exposed to higher levels of radiation from an atomic explosion would probably be destroyed or disabled by the heat or shock wave, any effects on sealant materials at these levels would appear to be of secondary interest.

Risk Management Team Memorandum

Date:	November 3, 2006
То:	G.A. Krueger Mike Godknecht
cc:	D.E. Vanover B.D. Sloane
From:	E.T. Burns

L.K. Lee

Subject: A Reassessment of the Oyster Creek Risk Metrics Using Current Drywell Configuration

The enclosed is in response to a request by Mike Godknecht to assess the impact of a modified Oyster Creek drywell floor curb configuration.

Enclosed is our current understanding of the Oyster Creek drywell floor configuration and its associated impacts.

The actions taken with regard to the reassessment are as follows:

- A URE has been created and evaluated (See URE OC2006-001)
- The draft reassessment was provided for comment on Thursday 11/2/06
- The draft reassessment has been finalized and reissued as an Exelon Support Application
- The reassessment has been reviewed
- A design record file has been created with the details of the sensitivity calculations. This DRF is retained by the Oyster Creek Model Owner on the Campbell network server.

This memo forwards the following with regard to the drywell curb modeling:

- An assessment of the risk metric impacts
- An assessment of possible SAMA effects

A REASSESSMENT OF THE OYSTER CREEK RISK METRICS USING CURRENT DRYWELL CONFIGURATION

RM Documentation Approval

RM DOCUMENTATION NO. OC-2006-SA-001 REV: 0

PAGE NO.

1

STATION: Oyster Creek Nuclear Generating Station UNIT(S) AFFECTED: 1

TITLE: A Reassessment of the Oyster Creek Risk Metrics Using Current Drywell Configuration

SUMMARY: The Oyster Creek Level 2 PRA was performed in 2004 assuming that a six inch curb surrounded the pedestal in the drywell. The current Oyster Creek configuration differs from that modeled in the 2004 PRA.

The current Oyster Creek configuration of the drywell floor has the 6 in. barrier between the pedestal and the drywell shell, except that two "sections" have been cut out of the barrier and trenches cut in the concrete toward the shell. One of the sections cut out is approximately across from the drywell pedestal doorway (i.e., the discharge point for debris from the pedestal). Given this configuration, the curb is likely not an effective barrier to the debris.

This support application evaluates the impact of the change in the model for both risk significance and potential impact on SAMA.

The results are that the risk impact is very small per RG 1.174 and there is no measurable effect on the SAMA evaluation that would influence decision-makers.

A REASSESSMENT OF THE OYSTER CREEK RISK METRICS USING CURRENT DRYWELL CONFIGURATION (CUTOUTS IN THE DRYWELL CURB)

A REASSESSMENT OF THE OYSTER CREEK RISK METRICS USING CURRENT DRYWELL CONFIGURATION (CUTOUTS IN THE DRYWELL CURB)

<u>Overview</u>

The Oyster Creek Level 2 PRA was performed in 2004 assuming that a six inch curb surrounded the pedestal in the drywell. The current Oyster Creek configuration differs from that modeled in the 2004 PRA.

This evaluation summarizes the changes in the risk metrics used by the NRC in riskinformed applications if the assumption regarding the presence of a curb is removed from the PRA. The NRC specified risk metrics used here to assess the importance of this change are as follows:

- Core Damage Frequency (CDF)
- Large Early Release Frequency (LERF)

Background

The Oyster Creek containment drywell configuration as modeled in the PRA includes a plant feature not present at other BWR Mark I plants, i.e., a six inch curb that surrounds the drywell pedestal near the shell. This curb may provide a barrier to prevent the flow of molten debris from reaching the drywell shell.

In the Oyster Creek PRA, when DW sprays are available, Theofanous, et. al. in NUREG/CR-5423 assessed the conditional shell failure probability as 1E-4 without any barrier. This assessment was adopted for Oyster Creek "as is".

In the Oyster Creek PRA model, the following assessments were made of the effect of the curb barrier for postulated severe accidents when no effective drywell water injection was available (e.g., no drywell sprays):

- For severe accidents in which core melt progression proceeds at high pressure until RPV breach, the barrier is found not to provide an effective method of preventing contact between the shell and

the molten debris. Therefore, the barrier is treated with a 1.0 failure probability. This makes Oyster Creek the same as other Mark I BWRs as assessed in NUREG/CR-5423 by Theofanous, et. al.

For severe accidents in which core melt proceeds at a low pressure at the time of RPV breach (e.g., LOCAs or cases with successful emergency depressurization), the barrier was judged to potentially be successful in preventing an "early" shell breach. This benefit is for cases where debris was retained mostly in the drywell sumps and in the RPV because then residual debris on the floor would be prevented from reaching the shell by the barrier. The conditional success probability of the debris being retained in the RPV and the sumps plus the benefit from the curb preventing significant debris contact was 0.25. Therefore, 75% of the low pressure core melt sequences which did not have effective debris cooling available resulted in early failure of the drywell shell due to direct debris contact.

Updated Information

The current Oyster Creek configuration of the drywell floor has the 6 in. barrier between the pedestal and the drywell shell, except that two "sections" have been cut out of the barrier and trenches cut in the concrete toward the shell. One of the sections cut out is approximately across from the drywell pedestal doorway (i.e., the discharge point for debris from the pedestal). Given this configuration, the curb is likely not an effective barrier to the debris. Therefore, the revised Oyster Creek drywell shell analysis becomes essentially the same as other Mark I plants, i.e., direct debris contact will occur with the shell.

Specifically, the conditional probability of shell failure identified by Theofanous in NUREG/CR-5423 under conditions of no water injection and the debris in contact with the shell is used and all credit for the presence of the curb is to be removed from the revised calculation.

<u>Results</u>

The sensitivity quantitative reassessment of the PRA is performed to reflect this Oyster Creek configuration by assuming the following:

- The Oyster Creek drywell curb does not provide an effective barrier to prevent debris contacting the shell for either high or low pressure core melt scenarios when no water is available to cool the debris.
- The Theofanous assessment of drywell shell failure probability for low pressure core melt scenarios is used.

This reassessment of the Oyster Creek Risk Metrics using the current drywell configuration that includes two cutouts in the curb adjacent to the drywell shell results in the following changes in risk metrics:

Risk Metric	PRA Model (2004B)	Reassessment		k Metric hange
CDF	1.05E-5/yr	1.05E-5/yr	0%	0.0/yr
LERF	5.80E-7/yr	6.38E-7/yr	9.8%	5.8E-8/yr

The significance of the risk metric changes are assessed by comparing the changes with the acceptance guidelines issued by the NRC in RG 1.174. The result of this evaluation is that these changes are considered to be very small risk changes by the NRC guidance.

AN EXAMINATION OF SAMA RESULTS THAT MAY BE AFFECTED BY CURRENT DRYWELL CONFIGURATION

AN EXAMINATION OF SAMA RESULTS THAT MAY BE AFFECTED BY CURRENT DRYWELL CONFIGURATION

1.0 OVERVIEW

An extensive evaluation of potential candidates for Severe Accident Mitigation Alternatives (SAMA) was undertaken by AmerGen as part of license renewal. This evaluation included both a base evaluation plus extensive sensitivity calculations with relatively large changes in input parameters to assess the robustness of SAMA cost-benefit calculations.

The SAMA evaluation was performed assuming that the Oyster Creek drywell had a curb in the drywell that was adjacent to the drywell shell. The following reassessment considers no credit for the presence of the curb.

This summary uses the original extensive analysis to place the change to the drywell configuration modeled in the PRA into perspective relative to the SAMA cost benefit calculations.

2.0 CALCULATIONS

2.1 <u>Maximum Impact</u>

The Maximum Averted Cost-Risk (MACR) used in the Oyster Creek SAMA evaluation is \$4,462,000.

To characterize the potential impact on the SAMA evaluation, one approach is to use the change in LERF to represent the entire impact on the radionuclide release spectrum. It is recognized that when the change in the full Level 2 PRA model is performed that there will be comparable reductions in other radionuclide release categories (e.g., H/I) and very small increases in the low radionuclide release categories (e.g., L/E). These compensating changes are addressed in the alternative MACR calculation shown in Section 2.2.

Examination of SAMA Results

The 9.8% increase in the LERF due to the elimination of the credit for a drywell curb results in an increase in the following SAMA input parameters:

- Dose of 0.46 person-rem/yr or 1.2% change
- Weighted Cost Risk (\$/yr) of \$2,187/yr or 1.85% change

These changes translate into a total MACR of \$4,528,110 or an increase of 1.5% above the base MACR value used in the original SAMA evaluation submitted to the NRC.

This approximates the maximum change that is possible from the change in modeling of the curb effects. In fact, the increase in the LERF category results in a comparable frequency reduction in other radionuclide release categories. Therefore, the net change will be even less than that cited above. Section 2.2 provides a "best estimate" evaluation of the change in input SAMA parameters.

2.2 Detailed Level 2 Calculation

A detailed recalculation of the radionuclide releases with credit for the curb removed indicated that the LERF increase was made up of a comparable decrease in the High/Intermediate release category and relatively minor changes in other radionuclide release categories.

Therefore, a more accurate assessment of the risk changes results in the following SAMA input parameters:

- Dose increase of 0.1 person-rem or 0.3%
- Weighted Cost Risk increase of \$1,000/yr or 0.85%

These changes translate into a total MACR of \$4,488,000 or an increase of 0.58% above the base MACR value used in the original SAMA evaluation submitted to the NRC.

These are judged to be very small changes in base values used in the cost benefit evaluation of SAMAs. Sections 2.3 and 2.4 further discuss this effect to place it in perspective.

2.3 <u>SAMA Sensitivity Results</u>

The SAMA evaluation developed a comprehensive list of potential alternatives to assess. This list was initially screened based on excessive costs. These screened out alternatives are discussed in Section 3.0. The alternatives that were retained received a detailed quantitative evaluation.

As part of the SAMA evaluation and the subsequent RAIs, there were extensive sensitivity calculations performed to assess the cost benefit of the SAMA items under varying inputs and assumptions and to demonstrate the robust nature of the calculations. Those sensitivity cases examined relatively large changes in the input parameters. The insights from these sensitivity calculations were then used to provide input to the decision-makers regarding individual SAMA items.

As part of the sensitivities, the calculations included:

- A CDF increase of a factor of 150% and therefore of all radionuclide releases. This represents a significantly more severe case then that postulated for the small changes associated with the impact of the elimination of credit for the curb. The 150% change can be compared with the relatively small change of 0.3% and 0.85% to the dose and weighted cost risk, respectively, associated with removal of credit for the curb taken from the detailed calculation discussed in Section 2.2.
- Real Discount Rate Changes: The sensitivity changes applied to the examined alternatives resulted in net changes in MACR of over \$100,000 in some cases. This sensitivity is significantly more inclusive than the small changes noted for the curb modifications.

The removal of credit for the drywell curb has a negligible impact on the base SAMA evaluations. In addition, the sensitivity cases performed demonstrate the benefit of

Examination of SAMA Results

the SAMAs over a much broader range of variation than that introduced by the curb evaluation.

3.0 SPECIFIC EXAMPLE SAMAS

Examples of SAMA items that could offset the impact of the modified curb, but were previously discarded based solely on cost were reviewed again when the credit for the curb is removed to assess their potential benefit. (See Table 1).

It is noted that some SAMA items were screened out based on: (1) inapplicability (e.g., ATWS mitigation SAMA 9, 79); or (2) as indicated in the NRC submittal on SAMA (Appendix F of the License Renewal) that regardless of assumptions, the item is not a SAMA that would ever be considered (e.g., SAMAs 65, 69, 70, 72, 77, 80, 103, 115, 137). Therefore, these are not included in Table 1.

4.0 CONCLUSION

There are no specific SAMA items for which the cost benefit assessment would be significantly changed by the explicit incorporation of the modified curb in the baseline SAMA calculations. The SAMA sensitivity calculations identified in the original submittal to the NRC and subsequent RAI responses encompassed the very small variation in benefits assigned to the curb.

In other words, the removal of credit for the drywell curb has a negligible impact on the base SAMA evaluations. In addition, the sensitivity cases performed demonstrate the benefit of the SAMAs over a much broader range of variation than that introduced by the curb evaluation.

NO.	SAMA TITLE	SAMA DESCRIPTION	PHASE I DISPOSITION	SCREENING REVIEW
2	Additional HP Injection System	An additional high pressure injection system would increase high pressure injection diversity and reduce the probability of requiring RPV depressurization early in an accident. An additional HP injection system would also impact the contribution of liner melt- through sequences in the Level 2 evaluation by reducing the frequency of high pressure core melt accident class.	F, I –Installation of another high pressure injection system is costly and is not offset by benefits. Benefits associated with an additional high pressure injection source are minimized by the Oyster Creek features of IC and CRD. IC is a passive high pressure inventory control method and the Oyster Creek CRD includes a dedicated bypass line	As a sensitivity, the base model was requantified after modifying logic to "AND" a new basic event with feedwater. This basic event is intended to represent a new high pressure injection system, with no support system requirements. The value was set equal to 5E-2. The resultant CDF was 7.34E-6/yr for a delta CDF of 3.15E-6/yr.
•	· · ·	The benefit of this SAMA would be increased if the pump was 1) diesel powered, 2) could provide power to operate its own injection valves, and 3) be located in a flood safe zone.	that allows significant flow. SAMA improvement related to CRD is included in Item 92. Improving CRD – flow would provide an additional high pressure injection system for scenarios wherein CRD is not currently credited.	This benefit (CDF reduction) is similar in magnitude to that of SAMA 130. SAMA 130 yields an averted cost of
			Cost of a self-powered, high pressure injection system, located in a separate fire and flood zone is expected to cost	factor of 2.5, to bound both the RDR and 95 th sensitivities, a value that is still far below the implementation cost
			\$10,000,000. This is in excess of the maximum averted cost.	is obtained (i.e., \$1,867,500 versus \$10,000,000). Therefore, this SAMA remains not cost beneficial despite the
				use of the conservatively biased sensitivity inputs.
				The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.

SUMMARY OF SENSITIVITY REVIEW OF PHASE I SCREENED SAMA REVIEW OF ITEMS SCREENED DUE TO COST (C) OR COST EXCEED BENEFIT (F) FOR

NO.	SAMA TITLE	SAMA DESCRIPTION	PHASE I DISPOSITION	SCREENING REVIEW
3	Enhance Depressurization and Injection Cues	RPV depressurization, while a reliable action, is an important contributor to plant risk. The cognitive portion of this action is specifically identified as an important contributor for another BWR. Potential means of improving the probability of identifying the need for depressurization include: adding a unique audible alarm and/or a highly visible alarm light to denote the need for depressurization. Installation of a large, graphical core display for water level is an additional enhancement.	F - Monticello estimated the cost of this modification to be about \$700,000. This is the result of combining the costs of performing the training/procedural changes and the required hardware changes. Procedural changes are generally on the order of \$50,000 to \$100,000 [F- 20] and the hardware costs are estimated based on the \$600,000 cost of installing computer aided instrumentation in the main control room. This will not significantly reduce operator error rate as annunicators are currently in place and improvement potential is minimal.	Regardless of the assumptions used to assess the value of risk-reduction, this SAMA is not judged cost-beneficial because the potential for improvement over the current capabilities is negligible. The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.
6	Drywell Igniters or Passive Hydrogen Ignition System	This SAMA would provide a means to reduce the chance of hydrogen detonation.	F - Benefit is negligible because Oyster Creek containment operates with an inerted environment. Therefore, for inerted containments, such as the Oyster Creek Mark I containment, the NRC has previously concluded that igniters are not safety significant. The Calvert Cliffs application for license renewal [F-3] estimates the cost of a passive hydrogen ignition system to be \$760,000.	Regardless of the assumptions used to assess the value of risk-reduction, this SAMA is not judged cost-beneficial because the potential for improvemen over the current capabilities is negligible. The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.

44	Install an independent method of suppression pool	This SAMA would decrease the probability of loss of containment heat removal.	F – IC provides an alternate method of DHR that eliminates heat discharge to the torus for non-LOCA scenarios. Development of another means	events would produce a delta CDF of 1.65E-6/yr.
	cooling.		beyond containment spray is viewed as limited benefit compared to a high cost for such a modification. An independent system is judged to cost \$5,000,000. This is in excess of the maximum averted cost.	This level of risk-reduction is less than that noted for SAMA 130. SAMA 130 yields an averted cost of \$747,000. Using this averted cost as a surrogate to estimate the benefit of SAMA 44 and multiplying this by a factor of 2.5, to bound both the RDR and 95 th sensitivities, a value that is still far below the implementation cost is obtained (i.e., \$1,867,500 versus \$5,000,000). Therefore, this SAMA remains not cost beneficial despite the use of the conservatively blased sensitivity inputs.
. ·				The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.
45	Install a filtered containment vent to remove decay heat.	This SAMA would provide an alternate decay heat removal method for non-ATWS events, with the released fission products being scrubbed. Option 1: Gravel Bed Filter Option 2: Multiple Venturi Scrubber	 F - Cost is high at > \$4M as assessed for Shoreham. The benefits in dose reduction are limited because of the Mark I shell failure mode and ATWS challenges that would fail containment. SAMA would not address core damage and does not address Noble gas 	Regardless of the assumptions used to assess the value of risk-reduction, thi SAMA is not judged cost-beneficial because the potential for improvemer over the current capabilities is small. Considering the high cost, the small variations in quantification characterization do not point to altering the conclusion for this SAMA.
			release. This was not found cost- beneficial for Peach Bottom. Estimated to cost in excess of the maximum averted cost.	The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.

46	Install a containment vent large enough to remove ATWS decay heat.	Assuming that injection is available, this SAMA would provide alternate decay heat removal in an ATWS event.	F – Cost is high and benefits, in terms of dose reduction, are limited because of the small ATWS contribution to the risk profile. Containment vent size is sufficient to prevent containment failure as long as reactivity	Completely removing the ATWS contribution would lead to a delta CD of 1.81E-7/yr. This level of benefit does not lead to any significant averted cost for this SAMA even if it could completely eliminate all ATWS
			management tasks are completed as modeled in the PRA (i.e., RPV level control and SLC initiation). ATWS power levels without reactivity control	risk. Therefore, the implementation cost fa outweighs the small averted cost and
•			would be in the range of 10% to 40% of full power. This requires a substantially larger containment vent than the current hard pipe vent. To	the SAMA is not cost beneficial even for these conservatively biased assumptions.
			achieve an operational "ATWS Vent" of hard pipe configuration and adequate size is estimated to cost in excess of \$2M. This is above the benefit to be achieved for elimination of the small ATWS contribution to risk at Oyster Creek.	The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.
48	Install a passive containment spray system.	This SAMA would provide redundant containment spray method without high cost.	F – High cost modification. Gravity feed system would provide limited benefit beyond that considered in Item 111 and would likely increase internal flooding risk.	not considered cost-beneficial.
				The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.

49	Construct a building to be connected to primary/secondary containment that is maintained at a vacuum.	This SAMA would provide a method to depressurize containment and reduce fission product release.	C – This item is viewed as having a very large cost (> \$10 Million) and is well beyond the maximum averted cost for Oyster Creek.	Regardless of the assumptions used to assess the value of risk-reduction, this SAMA is not judged cost-beneficial because the potential for improvemen over the current capabilities is small. Considering the high cost, variations in quantification assumptions do not point to altering the conclusion for this SAMA.
				The change in curb configuration would have no more than a 0.58% change and the conclusion would remain the same.
51	Provide an additional diesel generator.	This SAMA would increase the reliability and availability of onsite emergency AC power sources.	C – Cost of an additional building and diesel is estimated at more than \$5M. This is greater than the maximum cost averted benefit.	1.47E-6/yr (1.05E-5*(1.14-1)). This
• . •				level of risk-reduction is less than than the noted for SAMA 130. SAMA 130 yield an averted cost of \$747,000. Using this averted cost as a surrogate to
				estimate the benefit of SAMA 51 and multiplying this by a factor of 2.5, to bound both the RDR and 95 th sensitivities, a value that is still far
				below the implementation cost remains not cost beneficial despite the use of the conservatively biased sensitivity inputs.
