Subject: ADDITIONAL ANALYSES - SELECTED SOILS FROM SHIELDALLOY SITE

Dear Mr. Kinneman:

As part of the 1987 radiological survey of the Shieldalloy Corporation site in Newfield, New Jersey, ORAU was requested to also analyze a few samples from the site perimeter and drainage pathways for non-radiological components. Twenty soil samples were analyzed by a combination of X-ray fluorescence and neutron activation. Results are presented in the attached tables. As might be expected, most of these samples had concentrations of chromium, vanadium, and niobium (columbium) in excess of those in baseline soil. I would not attempt to interpret this data, but I would appreciate if you would pass it on to the appropriate contacts in the New Jersey Department of Health.

If NRC or New Jersey officials have any questions, I may be reached at (615) 576-3305 or FTS 626-3305.

Sincerely,

James D. Berger, Manager
Radiological Site Assessment Program
