**Subject:** Recommendation from Tom Nicholson

Don: for your consideration...Tom Nicholson, RES, noted that water was seeping from the sides of the Trapp Rock Quarry...he suggested that if a sample of the seep could be accomplished, that it would provide another excellent data point to confirm that material has not migrated offsite (notwithstanding LaFarge and other off-site sampling location have all been ND to-date). Since samples from the quarry are extremely dilute due to the volume, a sample directly from the seep could prove useful as a confirmatory data point. I am suggesting it for your consideration...for H-3, Sr-90 and photos as appropriate in order to demonstrate to the public the thoroughness of the effort...John
