SECTION 3

EXAM OVERVIEW

Title: Large Break LOCA

ID Number: 2K7 NRC-01

Revision: 0

1. The Session will begin with the plant at 100% power and at end of life. The "A" EDG is out of service for planned maintenance. The "C" TPCCW pump is out of service for an oil replacement. After taking the shift, a tube leak will occur in the "B" MSR. The crew will use OP 3317, *Reheat and Moisture Separator*, to identify the MSR leakage and determine required actions, which include a power reduction of 10% followed by taking the MSRs out of service. Plant Management will direct the crew to lower power using AOP 3575, *Rapid Downpower*, @ 1/2% per minute. During the downpower, controlling PZR Level transmitter, 3RCS-L459, will fail as is. The crew should respond by entering AOP 3571, *Response to an Instrument Failure*, to address the problem.

Once Tech Specs have been addressed, and bistables tripped, the SG steam flow channel, 3MSS*FT542, will fail low. Again, the crew should enter AOP 3571 "Instrument Failure Response" to address the failure.

Once actions as specified in AOP 3571 are complete, the Digital Rod Position Indication system will develop a Data B failure on rod M4. AOP 3552, *Malfunction of the Rod Drive System*, will be used by the crew to mitigate the event.

When AOP 3552 actions are complete, the crew will experience a Loss of 125 Volt DC Bus 4 and will respond using AOP 3563, *Loss of DC Bus Power*. There are no Main Board actions other than verifying system response. The US should evaluate and enter the appropriate Tech Spec. If attempted, power cannot be restored to the Battery Bus.

Once Tech Specs have been addressed, a leak (tube failure) of Reactor Plant Component Cooling Water (CCP) into the Upper Oil Reservoir of the "C" RCP will occur. CCP Surge Tank level, though slight, will discernibly decrease and, after a few minutes of leakage, an Oil Reservoir high level alarm will sound. The crew should take action per the ARP and AOP 3554, *RCP Trip or Stopping a RCP at Power* to attempt to reduce reactor power and take the affected RCP out of service. The crew will not have the time to downpower prior to exceeding RCP motor bearing temperature limits and should elect to trip the plant and the affected RCP. If the crew takes no action the affected RCP will seize and the reactor will trip.

At the time of the reactor trip a small break LOCA on loop 3 occurs (simulating a break in the area of the affected RCP). The crew will carry out the immediate actions of E-0, *Reactor Trip and Safety Injection*, determine that automatic safety injection (SI) actuation has failed, and manually initiate SI **[Critical Task]**. While in E-0, the crew should recognize that the AFW pumps did not start and take action to start the pumps **[Critical Task]**.

The crew should then transition to E-1, *Loss of Reactor or Secondary Coolant*, and stop the RHR pumps when procedurally directed. After the crew trips the RHR pumps, the LOCA will rapidly increase in severity forcing the restart of the RHR pumps. As the break size increases an "Orange" Path will be generated based on CTMT pressure. The crew should respond by transitioning to FR-Z.1, *Response to high CTMT Pressure*. CDA Train "A" & "B" will fail to

automatically or manually actuate. This will require the crew to manually manipulate individual components **[Critical Task]**. If the operator uses the pushbuttons to manually actuate CDA, the RHR pumps will not automatically start. The RHR pumps will need to be started using the hand switches on MB2. The RHR pumps will start and provide flow. Once FR-Z.1 is complete, the crew transitions back to E-1, the session can be terminated.

2. The US should classify the event as an ALERT – Charlie One based on failure of the RCS barrier.
3. Duration of Exam: 75 minutes

SECTION 4

EXAM GUIDE

Title: Large Break LOCA

ID Number: 2K7 NRC-01

Revision: 0

All Control Room Conduct, Operations and Communications shall be in accordance with Master Manual 14 and applicable DNAP/DNOS standards.

"Review the Simulator Operating Limits (design limits of plant) and the Simulator Modeling Limitations and Anomalous Response List prior to performing this exam scenario on the simulator. The evaluators should be aware if any of these limitations may be exceeded."
(NSEM 6.06)

Revision: 0

SIMULATOR PROBLEMS DURING EXAMS

It is the responsibility of the Instructors in the simulator to insure that training interruptions have a minimum negative impact on the Crew and the training we provide. Use your judgment on whether to stop the training and how the training should be commenced after the problem is corrected.

Be aware that at all times the Operators should treat the simulator as if it were the plant and you too should treat it as much like the plant as possible when they are in the simulator.

As soon as the Instructors are aware of a simulator problem that will adversely affect the training in progress (computer fault, etc.) the Instructor should:

1. Place the simulator in FREEZE if possible.
2. Announce to the Crew that there is a simulator problem.
3. Request that the Crew either standby (for minor trouble that can be handled quickly) or leave the simulator control room. (The Crew should leave the simulator for problems which involve major switch alignments).
4. Deal with the problem (reboot, close tripped breaker, call STSB, etc.)
5. After the Instructors believe the simulator is restored to service, the Crew should be told how training will continue. If it is possible and felt to be acceptable to the Instructors, training can begin where it left off with an update on plant parameters and each Crew member is prepared to restart. If training will not begin where it left off, the crew should be told how and where training will begin again.
6. Once the Crew has been told how and where training will begin, have the crew conduct a brief so that the Instructor can insure that the crew has all the necessary information to continue with the scenario.
7. Once all Crew members and Instructors are satisfied that they have the necessary information to continue the scenario, place the simulator in RUN and announce to the Crew that you have continued the training session.

Lesson Title: Large Break LOCA

ID Number: 2K7 NRC-01

Revision: 0

INITIAL SETUP INSTRUCTIONS

1. START the Sun Workstation.
 - a. IF the Sun Workstation is running THEN go to SIM ACTIVE.
2. PLACE Recorder Power to ON.
3. VERIFY that the current approved training load is loaded.
4. REMOVE the step counter OVERRIDE and allow the counters to step out during the IC reset.
5. RESET to **IC XX** (Based on IC 21)
6. ADJUST the various pot settings to the valued specified by the chart in the simulator booth or Notepad for the selected IC. Pay particular attention to the Pzr spray valves and their setpoints.
7. PLACE Simulator to RUN.
8. If Necessary, RESET the Plant Calorimetric at the Instructor Station PPC by Pressing "SHIFT LEFT" and "F6" simultaneously.
9. ENSURE Simulator fidelity items cleared.
 - a. CHECK the STEP COUNTERS at correct position for plant conditions.
 - b. PLACE _7_ tiles under the DEMINS IN SERVICE lamacord label on MB6.
 - c. PLACE the Main Turbine on the LOAD LIMITER and ENSURE Standby Load Set MATCHED if conditions require.
 - d. PLACE the Westronic (5) and Gammametrics (2) recorders in active/run by depressing up or down arrow for each.
 - e. For the RIL recorder: select printer to "ON" when command? appears select "Autojog".
 - f. CLEAR DCS alarms on MB7 and BOP console.
 - g. VERIFY annunciator, "COMPUTER FAILURE" (MB4C, 1-11), is NOT LIT.
10. As needed, RESET Computer Terminals to At Power displays if 100% power IC.
11. RESET Rad Monitor Screen to Status Grid.

Lesson Title: Large Break LOCA

ID Number: 2K7 NRC-01

Revision: 0

INITIAL SETUP INSTRUCTIONS

12. IF placing equipment OOS, THEN perform the necessary switch manipulations and hang appropriate tags, as required, listed under "Equipment OOS."
13. Ensure that the protected train and environmental placards are appropriately hung.

Equipment OOS: **"A" EDG (Yellow Tag on Start Switch, Output Breaker and Prelube pump)**
 "C" TPCCW pump (Yellow Tag on control switch)

Insert applicable Crew Training Tape/CD into the DVD/VCR.

Verify the MONITOR Time Display the same as the digital time display on MB4. If not page/call the Unit Tech.

Initial Malfunctions/IOs/IDAs:

PLACE GREEN PLACARDS FOR ALL INTAKE PARAMETERS ON MB6

PLACE THE "B" TRAIN PROTECTED PLACARD ON MB4

SECTION 4

INITIAL SETUP INSTRUCTIONS

Lead Examiner: Refer to the "Briefing Script for the Operational Exam" and brief the crew. Go over the Plant/simulator differences, which follow.

Booth Instructor: Commence recording Simulator session

Booth Instructor: Perform the crew turnover (Initial Conditions page at end of LP) with the SM . Have the SM brief his crew on plant conditions and any major equipment OOS.

PLANT/SIMULATOR DIFFERENCES:

- Rad Monitor Historical Data--Simulator Rad Monitor historical data not valid prior to the beginning of this exercise.
- If not using the speed dial option on the phone system, the operator must dial either #3333 or #3334 to reach the person/department they desire.
- The following PPC programs do not function on the simulator:
 - Samarium Follow
 - Xenon Follow
 - Sequence of Events
- Flow indications 3SIH-FI917 (charging ECCS flow), 3SIH-FI918 (A SI pump flow) and 3SIH-FI922 (B SI pump flow) will show flow at low flow rates.

EVALUATION GUIDE

I. Crew FOLLOW-UP QUESTIONS

1. What is the Emergency Classification for this event?

ALERT – Charlie One based on failure of the RCS barrier. (RCB4)

2. What plant condition(s) is(are) of greatest concern for (this event)?

Reactor coolant release to the CTMT.

4. What actions did the crew take to directly mitigate (this event)?

Carried out the actions of E-0 and E-1. Identified, the need for a Safety Injection and the restart of the RHR Pumps with CTMT Spray

5. Which safety function(s) were challenged or had the greatest potential for challenge? Describe why.

CTMT Integrity as the CDA required a manual actuation

II. Critical Tasks

Note: Critical Tasks are not required for Progress Review Exams.

<u>TASK DESCRIPTION</u>	<u>TASK #</u>	<u>K/A >= 3.0</u>	<u>BASIS SELECTION</u>
Establish 530 gpm AFW flow to the S/Gs before transition out of E-0 unless transition to FR-H.1. Then before step 3.	E-0--F	3.9/4.0 061 000 GEN 14	Failure to establish minimum required AFW flow, under the postulated plant conditions, results in "adverse consequences."
Trip all RCPs so that an Orange Path on Core Cooling based on core exit thermocouples (718°F) does not occur when forced circulation in the RCS stops (small break LOCA).	E-1 --C	3.6/3.6 009 EA1.09 4.2/4.3 009 EK3.23	Failure to trip the RCPs under the postulated plant conditions leads to core uncover and to fuel cladding temperatures in excess of 2200°F, which is the limit specified in the ECCS acceptance criteria.
Manually actuate at least one train of SIS-actuated safeguards before completion of step 4 of E-0.	E-0--D	4.5/4.8 006 030 A2.01	Failure to manually actuate SI represents a "demonstrated in-ability by the crew to take an action or combination of actions that would prevent a challenge to plant safety."
Establish at least one Quench Spray train flow before completion of FR-Z.1 step 4.	E0-E	026 000 A1.01 3.9/4.2	Failure to establish at least one Quench Spray train flow under the postulated conditions constitutes a "demonstrated inability by the crew to recognize a failure/incorrect auto actuation of an ESF system or component."

Note: [*] Used to designate critical tasks. Should also be incorporated into column 3 or 4 of Instructor Guide.

VALIDATION CHECKLIST

Title: Large Break LOCA

ID Number: 2K7 NRC-01

Revision: 0

Verified By:
(Initials)

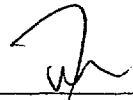

Initial Conditions:

The initial condition(s) contained in the guide are certified or have been developed from certified ICs.

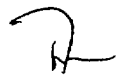

Test Run:

The scenario contained in the guide has been test run in part or whole on the simulator. The simulator response is reasonable and as expected. If a simulator guide revision does not affect original Test Run, then enter N/A.

 | ②

Simulator Operating Limits:

The simulator guide has been evaluated for operating limits and/or anomalous response by reviewing the Simulator Modeling and Anomalous Response List.

 | ②

For Examination Scenario:

The Scenario Attributes Checklist is complete and attached. This is not required for Progress Review Exams.

Actions Complete (Signature)

1/24/07
Date

Facility: Millstone 3 Scenario No.: 2K7 NRC-01 Op-Test No.: 2K7

Examiners: _____ Operators: _____

Initial Conditions: IC-21, 100% power, End of Life, Equilibrium Xe.

Turnover:

The plant is at 100% power and at end of life. The "A" Emergency Diesel Generator is out of service for major maintenance. The "C" TPCCW pump is out of service for oil replacement.

Event No.	Malf. No	Event Type*	Event Description

Revision: 0

Assessor: Dave Minnich

QUALITATIVE ATTRIBUTES

- Y 1. The initial conditions are realistic, in that some equipment and/or instrumentation may be out of service, but it does not cue the crew into expected events.
- Y 2. The scenario consists mostly of related events.
- Y 3. Each event description consists of:
- the point in the scenario when it is to be initiated
 - the malfunctions(s) that are entered to initiate the event
 - the symptoms/cues that will be visible to the crew
 - the expected operator actions (by shift position)
 - the event termination point (if applicable)
- Y 4. No more than one non-mechanistic failure (e.g., pipe break) is incorporated into the scenario without a credible preceding incident such as a seismic event.
- Y 5. The events are valid with regard to physics and thermodynamics.
- Y 6. Sequencing/timing of events is reasonable, and allows for the examination team to obtain complete evaluation results commensurate with the scenario objectives.
- N/A 7. If time compression techniques are used, scenario summary clearly so indicates. Operators have sufficient time to carry out expected activities without undue time constraints. Cues are given.
- Y 8. The simulator modeling is not altered.
- Y 9. The scenario has been validated. Pursuant to 10 CFR 55.46(d), any open simulator performance deficiencies or deviations from the referenced plant have been evaluated to ensure functional fidelity is maintained while running the planned scenario.
- Y 10. Every operator will be evaluated using at least one new or significantly modified scenario. All other scenarios have been altered IAW Section D.5 of ES-301.
- Y 11. All individual operator competencies can be evaluated, as verified using form ES-301-6.
- Y 12. Each operator will be significantly involved in the minimum number of transients and events specified on Form ES-301-5.
- Y 13. Level of difficulty is appropriate to support licensing decisions for each crew position.

SECTION 3

EXAM OVERVIEW

Title: Four Faulted Steam Generators

ID Number: 2K7 NRC-02
Exam Brief:

Revision: 0

1. The Session will begin with the plant at 100% power and at end of life. The "A" EDG is out of service for planned maintenance. The "C" TPCCW pump is out of service for an oil replacement. Shortly after turnover is complete a Pressurizer Pressure Instrument will fail high. This failure will require the use of AOP 3571, *Instrument Failure Response*, to respond to the failure. The procedure should be completed up to and including addressing any required Technical Specifications.

After completion of AOP 3571, a feed flow instrument failure will occur on the "C" Steam Generator. Again, the crew should enter AOP 3571 "Instrument Failure Response" to address the failure.

Once feed control has been regained and "C" SG water level stable, RCS leak of about 20 gpm will occur from the reactor vessel flange inner O-ring. VCT level will decrease, CDDT level will increase and the annunciator for high flange leakoff temperature will alarm. The crew will enter the annunciator response procedure for *RX VESSEL FLG LEAKOFF TEMP HI*, to mitigate the event. Leakage will be in excess of the Tech Spec limit on Identified RCS leakage. The leak will be isolable.

After the crew has isolated the RCS leak, a narrow range Tc instrument will fail high. Rods will begin stepping in. The crew will utilize AOP 3571, *Instrument Failure Response* to mitigate the failure.

When AOP 3571 is complete, CONVEX will direct the crew to begin an "Emergency Load Reduction" decreasing unit electrical output by 300 MWe. The crew will use AOP 3575, Rapid Downpower to accomplish this down power. The emergency boration valve, 3CHS*MV8104, will fail to open and the RO will have to use the RNO steps to achieve boration flow.

Once the crew has completed the downpower, the electrical grid will become unstable resulting in a main generator trip. The reactor will fail to automatically trip **[Critical Task]**, resulting in SG pressures increasing. A steam break will occur upstream of the "A" MSIV inside the Main Steam Valve Building. Once the plant is tripped, the "A" & "B" MSIVs will fail to close and the "C" and "D" SG low set safety valves will stick open. Main Steamline Isolation (MSI) will fail to automatically actuate, necessitating the crew to manually initiate MSI **[Critical Task]**. Additionally, several RPCCW components will fail to respond as required to the safety injection signal and will have to be manually positioned by the crew. The crew should proceed through E-0 to E-2 to ECA-2.1. After progressing into the SI Termination steps of ECA-2.1, the "C" low set safety valve will close. The scenario will end when the crew identifies the safety valve closure and pressure increasing in the "C" SG, and discusses the transition to E-2, once SI termination is complete.

2. The SM/ US should classify this event as an ALERT based on failure of automatic reactor trip (EA1). The event is also classifiable at the ALERT level based on Unisolable Steam Line Break outside CTMT (BA2).

3. Duration of Exam: 75 minutes

SECTION 4

EXAM GUIDE

Revision: 0

SIMULATOR PROBLEMS DURING EXAMS

It is the responsibility of the Instructors in the simulator to insure that training interruptions have a minimum negative impact on the Crew and the training we provide. Use your judgment on whether to stop the training and how the training should be commenced after the problem is corrected.

Be aware that at all times the Operators should treat the simulator as if it were the plant and you too should treat it as much like the plant as possible when they are in the simulator.

As soon as the Instructors are aware of a simulator problem that will adversely affect the training in progress (computer fault, etc.) the Instructor should:

1. Place the simulator in FREEZE if possible.
2. Announce to the Crew that there is a simulator problem.
3. Request that the Crew either standby (for minor trouble that can be handled quickly) or leave the simulator control room. (The Crew should leave the simulator for problems which involve major switch alignments).
4. Deal with the problem (reboot, close tripped breaker, call STSB, etc.)
5. After the Instructors believe the simulator is restored to service, the Crew should be told how training will continue. If it is possible and felt to be acceptable to the Instructors, training can begin where it left off with an update on plant parameters and each Crew member is prepared to restart. If training will not begin where it left off, the crew should be told how and where training will begin again.
6. Once the Crew has been told how and where training will begin, have the crew conduct a brief so that the Instructor can insure that the crew has all the necessary information to continue with the scenario.
7. Once all Crew members and Instructors are satisfied that they have the necessary information to continue the scenario, place the simulator in RUN and announce to the Crew that you have continued the training session.

Lesson Title: Four Faulted Steam generators

ID Number: 2K7 NRC-02

Revision: 0

INITIAL SETUP INSTRUCTIONS

1. START the Sun Workstation.
 - a. IF the Sun Workstation is running THEN go to SIM ACTIVE.
2. PLACE Recorder Power to ON.
3. VERIFY that the current approved training load is loaded.
4. REMOVE the step counter OVERRIDE and allow the counters to step out during the IC reset.
5. RESET to **IC XX (Based on IC 21)**
6. ADJUST the various pot settings to the valued specified by the chart in the simulator booth or Notepad for the selected IC. Pay particular attention to the Pzr spray valves and their setpoints.
7. PLACE Simulator to RUN.
8. If Necessary, RESET the Plant Calorimetric at the Instructor Station PPC by Pressing "SHIFT LEFT" and "F6" simultaneously.
9. ENSURE Simulator fidelity items cleared.
 - a. CHECK the STEP COUNTERS at correct position for plant conditions.
 - b. PLACE 7 tiles under the DEMINS IN SERVICE lamacord label on MB6.
 - c. PLACE the Main Turbine on the LOAD LIMITER and ENSURE Standby Load Set MATCHED if conditions require.
 - d. PLACE the Westronic (5) and Gammametrics (2) recorders in active/run by depressing up or down arrow for each.
 - e. For the RIL recorder: select printer to "ON" when command? appears select "Autojog".
 - f. CLEAR **DCS** alarms on MB7 and BOP console.
 - g. VERIFY annunciator, "COMPUTER FAILURE" (MB4C, 1-11), is NOT LIT.
10. As needed, RESET Computer Terminals to At Power displays if 100% power IC.
11. RESET Rad Monitor Screen to Status Grid.
12. IF placing equipment OOS, THEN perform the necessary switch manipulations and hang appropriate tags, as required, listed under "Equipment OOS."

Lesson Title: Four Faulted Steam generators

ID Number: 2K7 NRC-02

Revision: 0

INITIAL SETUP INSTRUCTIONS

13. Ensure that the protected train and environmental placards are appropriately hung.

Equipment OOS: **“A” EDG (Yellow Tag on Start Switch, Output Breaker and Prelube pump)**
 “C” TPCCW pump (Yellow Tag on control switch)

Insert applicable Crew Training Tape/CD into the DVD/VCR.

Verify the MONITOR Time Display the same as the digital time display on MB4. If not page/call the Unit Tech.

Initial Malfunctions/IOs/IDAs:

PLACE GREEN PLACARDS FOR ALL INTAKE PARAMETERS ON MB6

PLACE THE “B” TRAIN PROTECTED PLACARD ON MB4

SECTION 4

Revision: 0

INITIAL SETUP INSTRUCTIONS

Lead Examiner: Refer to the "Briefing Script for the Operational Exam" and brief the crew. Go over the Plant/simulator differences, which follow.

Booth Instructor: Commence recording Simulator session

Booth Instructor: Perform the crew turnover (Initial Conditions page at end of LP) with the SM . Have the SM brief his crew on plant conditions and any major equipment OOS.

PLANT/SIMULATOR DIFFERENCES:

- Rad Monitor Historical Data--Simulator Rad Monitor historical data not valid prior to the beginning of this exercise.
- If not using the speed dial option on the phone system, the operator must dial either #3333 or #3334 to reach the person/department they desire.
- The following PPC programs do not function on the simulator:
 - Samarium Follow
 - Xenon Follow
 - Sequence of Events
- Flow indications 3SIH-FI917 (charging ECCS flow), 3SIH-FI918 (A SI pump flow) and 3SIH-FI922 (B SI pump flow) will show flow at low flow rates.

Note: Critical Tasks are not required for Progress Review Exams.

<u>TASK DESCRIPTION</u>	<u>TASK #</u>	<u>K/A >= 3.0</u>	<u>BASIS FOR SELECTION</u>
Attempt to manually trip the reactor from the control room with either Main Board trip switch or by opening 32B and 32N supply breakers before completing step 1 of E-0.	E-0 -- A	029-EA1.08 4.5/4.5 029-EA1.12 4.1/4.0	(BASIS) Failure to manually trip the reactor causes a challenge to the subcriticality CSF beyond that irreparably introduced by the postulated conditions. Additionally, it constitutes an "incorrect performance that necessitates the crew taking compensating action which complicates the event mitigation strategy and demonstrates the inability by the crew to recognize a failure of the automatic actuation of the RPS."
Manually actuate Main Steamline isolation or close MSIVs before a severe (orange path) challenge develops to either the subcriticality or the integrity CSF or before transition to ECA-2.1, whichever happens first	E-0—P	E12-EA1.1 3.8/3.8 039-K4.05 3.7/3.7	Failure to close the MSIVs under the postulated plant conditions causes challenges to CSFs beyond those irreparably introduced by the postulated conditions. Such an omission constitutes a "demonstrated inability by the crew to recognize a failure of the auto actuation of an ESF system or component and to take an action that would prevent a challenge to plant safety."
Control the AFW flow rate to at least 100 gpm per SG in order to minimize the RCS cooldown rate before a severe (orange-path) challenge develops to the integrity CSF	ECA-2.1 -- A	E12.EA1.3 3.4/3.9	Failure to control the AFW flow rate to the SGs leads to an unnecessary and avoidable severe challenge to the integrity CSF and to the subcriticality and the containment CSFs beyond those irreparably introduced by the postulated plant conditions. Thus, failure constitutes "demonstrated inability by the crew to take an action or combination of actions that would prevent a challenge to plant safety."

Note: [*] Used to designate critical tasks. Should also be incorporated into column 3 or 4 of Instructor Guide.

VALIDATION CHECKLIST

Title: Four Faulted Steam Generators

ID Number: 2K7 NRC-02

Revision: 0

Verified By:
(Initials)

Initial Conditions:

The initial condition(s) contained in the guide are certified or have been developed from certified ICs.

JK

Test Run:

The scenario contained in the guide has been test run in part or whole on the simulator. The simulator response is reasonable and as expected. If a simulator guide revision does not affect original Test Run, then enter N/A.

JK | ②

Simulator Operating Limits:

The simulator guide has been evaluated for operating limits and/or anomalous response by reviewing the Simulator Modeling and Anomalous Response List.

JK | ②

For Examination Scenario:

The Scenario Attributes Checklist is complete and attached. This is not required for Progress Review Exams.

JK

David S
Actions Complete (Signature)

Revision: 0

Assessor: Dave Minnich

QUALITATIVE ATTRIBUTES

- Y 1. The initial conditions are realistic, in that some equipment and/or instrumentation may be out of service, but it does not cue the crew into expected events.
- Y 2. The scenario consists mostly of related events.
- Y 3. Each event description consists of:
- the point in the scenario when it is to be initiated
 - the malfunctions(s) that are entered to initiate the event
 - the symptoms/cues that will be visible to the crew
 - the expected operator actions (by shift position)
 - the event termination point (if applicable)
- Y 4. No more than one non-mechanistic failure (e.g., pipe break) is incorporated into the scenario without a credible preceding incident such as a seismic event.
- Y 5. The events are valid with regard to physics and thermodynamics.
- Y 6. Sequencing/timing of events is reasonable, and allows for the examination team to obtain complete evaluation results commensurate with the scenario objectives.
- N/A 7. If time compression techniques are used, scenario summary clearly so indicates. Operators have sufficient time to carry out expected activities without undue time constraints. Cues are given.
- Y 8. The simulator modeling is not altered.
- Y 9. The scenario has been validated. Pursuant to 10 CFR 55.46(d), any open simulator performance deficiencies or deviations from the referenced plant have been evaluated to ensure functional fidelity is maintained while running the planned scenario.
- Y 10. Every operator will be evaluated using at least one new or significantly modified scenario. All other scenarios have been altered IAW Section D.5 of ES-301.
- Y 11. All individual operator competencies can be evaluated, as verified using form ES-301-6.
- Y 12. Each operator will be significantly involved in the minimum number of transients and events specified on Form ES-301-5.
- Y 13. Level of difficulty is appropriate to support licensing decisions for each crew position.

Lesson Title: Four Faulted Steam Generators

ID Number: 2K7 NRC-02

Revision: 0

Note: Following criteria list scenario traits that are numerical (QUANTITATIVE) in nature.

01. Total Malfunctions (TM) – 5 to 8 required Total 9
(1) PZR Pressure Failure, (2) SG Feed Flow Instrument Failure, (3) RCS Leak, (4) Tavg Channel Failure (5) Emergency Boration Valve Fails, (6) Automatic Reactor Trip Failure, (7) Four Faulted SGs, (8) MSI Auto Actuation Failure, (9) RPCCW Components Fail to Auto position on an SI
02. Malfunctions after EOP entry (EM's) – 1 to 2 required Total 3
(1) Four Faulted SGs, (2) MSI Auto Actuation Failure, (3) RPCCW Components Fail to Auto position on an SI
03. Abnormal Events (AE) – 2 to 4 required Total 5
(1) PZR Pressure Failure (AOP 3571), (2) SG Feed Flow Instrument Failure (AOP 3571), (3) RCS Leak (ARP MB4A), (4) Tavg Channel Failure (AOP 3571), (5) Rapid Downpower (AOP 3575)
04. Major Transients (MT) – 1 to 2 required Total 1
(1) Four Faulted SGs
05. EOP's (EU) entered/requiring substantive actions -- 1 to 2 required Total 2
(1) E-2, (2) ECA-2.1
06. EOP Contingencies requiring substantive actions [ECAs/FRs/] (EC) -- 0 to 2 required Total 1
(1) ECA-2.1
07. Critical Tasks (CT) – 2 to 3 required Total 3
E-0 – A Manually trip the reactor from the control room before completion of step 1 of E-0.
E-0 – P Manually actuate MSI or close the MSIVs before a severe challenge develops to the Subcriticality or Integrity CSFs.
ECA-2.1 – A Control the AFW flowrate to at least 100 gpm per SG in order to minimize the RCS cooldown rate.
08. Approximate Scenario Run Time: 60 to 90 min. Total 90 min
09. EOP run time: Total 45 min
10. Technical Specifications are exercised during the scenario. (Y/N) Y

SECTION 3

EXAM OVERVIEW

Title: Loss of All AC Power

ID Number: 2K7 NRC-03

Revision: 0

1. The crew will take the shift with reactor power stable at the point of adding heat (reactor power 3%), following a reactor startup by the previous shift. This is the initial plant startup from a refueling outage. OP 3203, *Plant Startup* is in progress and complete up through step 4.2.7. The crew is to raise reactor power from 3% to 6 to 9% in accordance with step 4.2.8. The US should facilitate a brief of the evolution prior to taking the shift. The MP3 simulator briefing room may be used for this purpose.

During the power ascension, the "B" RPCCW pump will spuriously trip and will not restart. The crew will use AOP 3561, *Loss of RPCCW*, to verify alignment and start the "C" RPCCW pump on the B Train.

Once the reactor is in MODE 1 (6 to 9%) and the primary plant stable, a small leak will develop through pressurizer PORV, 3RCS*PCV455A. The crew should use ARP MB4A 3-5, *PZR RELIEF VALVE DIS TEMP HI*, to respond. Correct actions will include closing the "A" PORV Block valve to isolate the leaky PORV. This event will exercise the US in Tech Spec and TRM use.

Once the reactor is 6 to 9% and the primary plant stable, Power Range Nuclear Instrument (NI) Channel 43 Lower Detector will fail high and the appropriate annunciators will alarm. Rod control is in manual so no rod motion will occur, but the auctioneered high PRNI channel inputs to the control circuitry for the FRV Bypass valves. The FRV Bypass valve controllers should be placed in manual and the crew should respond using AOP 3571, *Instrument Failure Response*. Tech Specs will need to be addressed.

Once Tech Specs are addressed for the failed NI, "A" RCP #1 seal will slowly degrade. The crew should address the RCP seal degradation using the Main Board 4 Annunciator Response Procedure for *RCP HI RANGE LKG FLOW HI*. The procedure requirements will have the operator transition to AOP 3554, *RCP Trip or Removing a RCP from Service At Power*, to stop the affected RCP. The procedure will then direct the crew to commence a plant and reactor shutdown.

After the RCP is tripped and a downpower plan discussed, transmission grid instabilities will result in a loss of offsite power. The "B" EDG will not start due to its inability to respond to signals from the Sequencer or MB8. Though the "A" EDG will initially start it will not load and will exhibit degraded frequency due to damaged governor linkage. The crew may conservatively decide to shutdown the EDG; if not the "A" EDG will trip at step 4 of E-0 and will not be able to be re-started. Also, at the time of the loss of power, an RCS leak will occur (A' RCP #1 seal catastrophically fails).

The crew should enter E-0, *Reactor Trip and Safety Injection*, and once the "A" EDG trips, transition to ECA 0.0, *Loss of All AC Power*. Prior to or at step 4 of ECA-0.0, the crew should diagnose that the TDAFW pump failed to auto-start and manually start the TDAFW **[Critical**

Task]. Plant assistance (a PEO/NLO, Maintenance, Engineering, etc.) should be dispatched to both EDGs to ascertain the reason for the start failures. The "B" EDG will be able to be started locally using ECA-0.0, Attachment E. The "B" EDG local start attempts will succeed when the crew is aligning the selected train busses for the Station Blackout Diesel. Service Water will need to be restored to the running EDG **[Critical Task]**. The crew should then Go To step 26 as per the note prior to step 6. Low pressurizer level will necessitate a transition to ECA 0.2, *Loss of All AC Power - Recovery with SI Required*. The session will end when the crew announces the transition to ECA-0.2.

2. The SM should classify the event as an **Site Area Emergency - Charlie Two**, Loss of Voltage on Buses 34C and 34D > 15 minutes (EAL PS1).
3. Duration of Exam: 120 minutes

SECTION 4

EXAM GUIDE

SIMULATOR PROBLEMS DURING EXAMS

It is the responsibility of the Instructors in the simulator to insure that training interruptions have a minimum negative impact on the Crew and the training we provide. Use your judgment on whether to stop the training and how the training should be commenced after the problem is corrected.

Be aware that at all times the Operators should treat the simulator as if it were the plant and you too should treat it as much like the plant as possible when they are in the simulator.

As soon as the Instructors are aware of a simulator problem that will adversely affect the training in progress (computer fault, etc.) the Instructor should:

1. Place the simulator in FREEZE if possible.
2. Announce to the Crew that there is a simulator problem.
3. Request that the Crew either standby (for minor trouble that can be handled quickly) or leave the simulator control room. (The Crew should leave the simulator for problems which involve major switch alignments).
4. Deal with the problem (reboot, close tripped breaker, call STSB, etc.)
5. After the Instructors believe the simulator is restored to service, the Crew should be told how training will continue. If it is possible and felt to be acceptable to the Instructors, training can begin where it left off with an update on plant parameters and each Crew member is prepared to restart. If training will not begin where it left off, the crew should be told how and where training will begin again.
6. Once the Crew has been told how and where training will begin, have the crew conduct a brief so that the Instructor can insure that the crew has all the necessary information to continue with the scenario.
7. Once all Crew members and Instructors are satisfied that they have the necessary information to continue the scenario, place the simulator in RUN and announce to the Crew that you have continued the training session.

Lesson Title: Four Faulted Steam generators

ID Number: 2K7 NRC-02

Revision: 0

INITIAL SETUP INSTRUCTIONS

1. START the Sun Workstation.
 - a. IF the Sun Workstation is running THEN go to SIM ACTIVE.
2. PLACE Recorder Power to ON.
3. VERIFY that the current approved training load is loaded.
4. REMOVE the step counter OVERRIDE and allow the counters to step out during the IC reset.
5. RESET to **IC XX (Based on IC 07)**.
6. ADJUST the various pot settings to the valued specified by the chart in the simulator booth or Notepad for the selected IC. Pay particular attention to the Pzr spray valves and their setpoints.
7. PLACE Simulator to RUN.
8. If Necessary, RESET the Plant Calorimetric at the Instructor Station PPC by Pressing "SHIFT LEFT" and "F6" simultaneously.
9. ENSURE Simulator fidelity items cleared.
 - a. CHECK the STEP COUNTERS at correct position for plant conditions.
 - b. PLACE _4_ tiles under the DEMINS IN SERVICE lamacord label on MB6.
 - c. PLACE the Main Turbine on the LOAD LIMITER and ENSURE Standby Load Set MATCHED if conditions require.
 - d. PLACE the Westronic (5) and Gammametrics (2) recorders in active/run by depressing up or down arrow for each.
 - e. For the RIL recorder: select printer to "ON" when command? appears select "Autojog".
 - f. CLEAR DCS alarms on MB7 and BOP console.
 - g. VERIFY annunciator, "COMPUTER FAILURE" (MB4C, 1-11), is NOT LIT.
10. As needed, RESET Computer Terminals to At Power displays if 100% power IC.
11. RESET Rad Monitor Screen to Status Grid.

SECTION 4

Lesson Title: Four Faulted Steam generators

ID Number: 2K7 NRC-02

Revision: 0

INITIAL SETUP INSTRUCTIONS

12. IF placing equipment OOS, THEN perform the necessary switch manipulations and hang appropriate tags, as required, listed under "Equipment OOS."
13. Ensure that the protected train and environmental placards are appropriately hung.

Equipment OOS: **NONE**

Insert applicable Crew Training Tape/CD into the DVD/VCR.

Verify the MONITOR Time Display the same as the digital time display on MB4. If not page/call the Unit Tech.

Initial Malfunctions/IOs/IDAs:

PLACE GREEN PLACARDS FOR ALL INTAKE PARAMETERS ON MB6

PLACE THE "B" TRAIN PROTECTED PLACARD ON MB4

ENSURE THE BORIC ACID POT SETTING IS ABOUT 5.9

SECTION 4

Revision: 0

INITIAL SETUP INSTRUCTIONS

Lead Examiner: Refer to the "Briefing Script for the Operational Exam" and brief the crew. Go over the Plant/simulator differences, which follow.

Booth Instructor: Commence recording Simulator session

Booth Instructor: Perform the crew turnover (Initial Conditions page at end of LP) with the SM . Have the SM brief his crew on plant conditions and any major equipment OOS.

PLANT/SIMULATOR DIFFERENCES:

- Rad Monitor Historical Data--Simulator Rad Monitor historical data not valid prior to the beginning of this exercise.
- If not using the speed dial option on the phone system, the operator must dial either #3333 or #3334 to reach the person/department they desire.
- The following PPC programs do not function on the simulator:
 - Samarium Follow
 - Xenon Follow
 - Sequence of Events
- Flow indications 3SIH-FI917 (charging ECCS flow), 3SIH-FI918 (A SI pump flow) and 3SIH-FI922 (B SI pump flow) will show flow at low flow rates.

Revision: 0

II. Critical Tasks

Note: Critical Tasks are not required for Progress Review Exams.

<u>TASK DESCRIPTION</u>	<u>TASK #</u>	<u>K/A >/= 3.0</u>	<u>BASIS SELECTION</u>
Establish 530 gpm AFW flow to the S/Gs prior to the completion of step 4 of ECA-0.0	ECA-0.0--B	061-000 A2.02 3.2/3.6	Failure to establish the minimum required AFW flow rate, under the postulated plant conditions, results in "adverse consequence(s) or a significant degradation in the mitigative capability of the plant."
Isolate RCP Seal Injection before a Charging Pump starts or is started	ECA-0.0--H	003-000 A4.01 3.3/3.2	Failure to isolate RCP seal injection before starting a charging pump, under the postulated plant conditions, can result in unnecessary and avoidable degradation of the RCS fission-product barrier, specifically at the point of the RCP seals, especially if RCPs are subsequently started.
Manually start the SW pump and verify SW flowpath before completing step 27 of ECA-0.0 such that the EDG does not fail because of damage caused by engine overheating.	ECA-0.0 -- F	076-A2.01 3.5/3.7	Failure to restore SW flow means that the EDG is running without SW cooling which leads engine overheating. Failure to perform the critical task constitutes "mis-operation or incorrect crew performance that leads to degraded emergency power capacity."

Note: [*] Used to designate critical tasks. Should also be incorporated into column 3 or 4 of Instructor Guide.

ATTACHMENT 2

VALIDATION CHECKLIST

Title: Loss of All AC Power

ID Number: 2K7 NRC-03

Revision: 0

Verified By:
(Initials)

Initial Conditions:

The initial condition(s) contained in the guide are certified or have been developed from certified ICs.

Test Run:

The scenario contained in the guide has been test run in part or whole on the simulator. The simulator response is reasonable and as expected. If a simulator guide revision does not affect original Test Run, then enter N/A.

 | ②

Simulator Operating Limits:

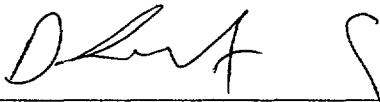

The simulator guide has been evaluated for operating limits and/or anomalous response by reviewing the Simulator Modeling and Anomalous Response List.

 | ②

For Examination Scenario:

The Scenario Attributes Checklist is complete and attached. This is not required for Progress Review Exams.

Actions Complete (Signature)

1/24/07
Date

Facility: Millstone 3 Scenario No.: 2K7 NRC-03 (spare) Op-Test No.: 2K7

Examiners: _____ Operators: _____

Initial Conditions: IC-07 (modified), 3% power, Beginning of Life, No Xe.

Turnover:

The crew will take the shift with reactor power stable at the point of adding heat (reactor power 3%), following a reactor startup by the previous shift. This is the initial plant startup from a refueling outage. OP 3203, Plant Startup is in progress.

Event No.	Malf. No	Event Type*	Event Description
1	CC01B	R (RO) R (SRO) N (BOP) C (RO)	Power ascension from 3% to 8% power using OP 3203, <i>Plant Startup</i> . Running RPCCW pump trip. Alignment and start of the standby RPCCW pump.
2	RC07A	C (RO)	Small leak develops through pressurizer PORV, 3RCS*PCV455A.
3	NI09C	I (BOP)	Power Range Nuclear Instrument (NI) Channel 43 Lower Detector fails high requiring FRV Bypass valve controllers to be placed in manual.
4	CV13A	C (RO) N (BOP)	"A" RCP #1 seal degradation resulting in high RCP seal leakoff. RCP is tripped using AOP 3554, <i>RCP Trip</i> or <i>Removing a RCP from Service At Power</i> .
5	ED01 EG06B	M (ALL)	Loss of offsite power, "B" Emergency Diesel Generator (EDG) fails to automatically or manually start from the control room.
6	EG08A EG07A FW20C	C (BOP) C (RO)	"A" EDG trips resulting in a loss of all AC power. TDAFW pump fails to auto-start. "B" EDG is started locally. "B" service water pumps fail to auto-start after "B" EDG is successfully started locally.

Lesson Title: Loss of All AC Power

ID Number: 2K7 NRC-03

Revision: 0

Assessor: Dave Minnich

QUALITATIVE ATTRIBUTES

- Y 1. The initial conditions are realistic, in that some equipment and/or instrumentation may be out of service, but it does not cue the crew into expected events.
- Y 2. The scenario consists mostly of related events.
- Y 3. Each event description consists of:
- the point in the scenario when it is to be initiated
 - the malfunctions(s) that are entered to initiate the event
 - the symptoms/cues that will be visible to the crew
 - the expected operator actions (by shift position)
 - the event termination point (if applicable)
- Y 4. No more than one non-mechanistic failure (e.g., pipe break) is incorporated into the scenario without a credible preceding incident such as a seismic event.
- Y 5. The events are valid with regard to physics and thermodynamics.
- Y 6. Sequencing/timing of events is reasonable, and allows for the examination team to obtain complete evaluation results commensurate with the scenario objectives.
- N/A 7. If time compression techniques are used, scenario summary clearly so indicates. Operators have sufficient time to carry out expected activities without undue time constraints. Cues are given.
- Y 8. The simulator modeling is not altered.
- Y 9. The scenario has been validated. Pursuant to 10 CFR 55.46(d), any open simulator performance deficiencies or deviations from the referenced plant have been evaluated to ensure functional fidelity is maintained while running the planned scenario.
- Y 10. Every operator will be evaluated using at least one new or significantly modified scenario. All other scenarios have been altered IAW Section D.5 of ES-301.
- Y 11. All individual operator competencies can be evaluated, as verified using form ES-301-6.
- Y 12. Each operator will be significantly involved in the minimum number of transients and events specified on Form ES-301-5.
- Y 13. Level of difficulty is appropriate to support licensing decisions for each crew position.

| 03. Abnormal Events (AE) – 2 to 4 required | Total <u>4</u> |
| (1) RPCCW Pump Trip (AOP 3561), (2) PORV Leak (ARP MB4A), (3) PRNI Channel Failure (AOP 3571), (4) RCP Seal Failure/RCP Trip (AOP 3554) | |
| 04. Major Transients (MT) – 1 to 2 required | Total <u>1</u> |
| (1) Loss of All AC Power | |
| 05. EOP's (EU) entered/requiring substantive actions -- 1 to 2 required | Total <u>1</u> |
| (1) ECA-0.0 | |
| 06. EOP Contingencies requiring substantive actions [ECAs/FRs/] (EC) -- 0 to 2 required | Total <u>1</u> |
| (1) ECA-0.0 | |
| 07. Critical Tasks (CT) – 2 to 3 required | Total <u>3</u> |
| <i>ECA-0.0-B</i> Establish 530 gpm AFW flow to the SGs prior to completion of step 4 of ECA-0.0 | |
| <i>ECA-0.0-H</i> Isolate RCP seal injection before a charging pump starts or is started. | |
| <i>ECA-0.0-F</i> Manually start the service water pump and verify a flowpath before completing step 27 of ECA-0.0. | |
| 08. Approximate Scenario Run Time: 60 to 90 min. | Total <u>90 min</u> |
| 09. EOP run time: | Total <u>45 min</u> |
| 10. Technical Specifications are exercised during the scenario. | (Y/N) <u>Y</u> |
