Stephen Cohen:

When the upwind air RadTrak/radon monitoring unit was exchanged on April 2, 2007, the plastic holder containing the unit was found on the ground. Horse hair on the support post indicated that a horse had been rubbing on the post loosening it and the holder for the RadTrak device, knocking the holder with the device to the ground. The device holder was found lying on its side on the ground. Results for that RadTrak detector arrived today. The detector returned an average radon concentration (for upwind air) of 16.9 picoCuries per liter. This anomalously high result is due the fact that the holder with the detector was lying in close proximity to the ground. The support post and holder have been subsequently reinstalled and to date are in good condition.
