## 1.0 INTRODUCTION

### 1.1 BACKGROUND

On behalf of Yankee Atomic Electric Company (Yankee), Environmental Resources Management (ERM) has prepared this March 2004 Groundwater Field Sampling Plan (FSP) for the Yankee Nuclear Power Station (YNPS) located at 49 Yankee Road in Rowe, Massachusetts (Figure 1). The FSP has been prepared as a supplement to the *Draft Quality Assurance Project Plan, Site Closure, Yankee Nuclear Power Station, Rowe, Massachusetts* and the *Final Groundwater Sampling Plan, Yankee Nuclear Power Station, July 2003*. The FSP outlines the approach and methods for characterizing groundwater quality at the site as part of the overall site closure program. This FSP addresses only non-radiological groundwater characterization activities.

### 1.2 PURPOSE & SCOPE

The purpose of the March 2004 Groundwater FSP is to:

- establish the procedures and rationale for groundwater sampling activities in support of site closure;
- ensure that groundwater sampling data are consistent with applicable procedures;
- ensure that the Data Quality Objectives (DQOs) for site closure are met;
- provide data to support preparation of the License Termination Plan (as required by the Nuclear Regulatory Commission); and
- support the site characterization and closure activities.

The data generated under the FSP will be validated and input into the site database. The results from the baseline sampling round as well as subsequent sampling rounds will be used in conjunction with Data Usability reports that are being prepared regarding the historic data to determine the need for, and scope of, future groundwater sampling events. The data will also be used to support human health and ecological risk assessments that will be prepared as part of the site closure program.

The scope of the March 2004 Groundwater FSP includes sampling of wells listed in Table 2. See Table 1 for a summary of groundwater well information and location descriptions.

## 2.0 GROUNDWATER SAMPLING PROGRAM

### 2.1 STANDARD OPERATING PROCEDURES

Standard Operating Procedures (SOPs) applicable to the groundwater investigation include:

- DP-9745 Groundwater Level Measurement and Sampler Collection in Observation Wells
- DP-8123 Sample Security and Chain of Custody
- AP-8601 Ground and Well Water Monitoring Program for the Yankee Nuclear Power Station Site
- Water Level Measurements
- Groundwater Sample Collection from Wells Having Pump Systems in Place
- Multi-Parameter Water Quality Monitoring
- Surface Water and Sediment Sample Collection

All applicable SOPs can be found in the *Final Groundwater Sampling Plan, Yankee Nuclear Power Station, July 2003*.

### 2.2 SAMPLE LOCATIONS AND DESIGNATIONS

A list of locations to be sampled for groundwater is provided in Table 2. The groundwater sample locations are shown on Figure 2.

The groundwater samples will be identified using a unique sample identification. The sample designations will use the naming convention as detailed in the YNPS QAPP. The sample designations for the groundwater sampling program are detailed in Table 2.

### 2.3 SAMPLING PROCEDURES

#### 2.3.1 Monitoring Well Sampling

All of the monitoring wells will be gauged prior to sampling in accordance with *DP-9745 Groundwater Level Measurement and Sampler*

*Collection in Observation Wells.* Water level measurements will be made using an electronic water level probe marked in 0.01-foot intervals.

After gauging, the monitoring wells will be sampled from the midpoint of the well screen using low-flow sampling techniques, as outlined in *DP-9745 Groundwater Level Measurement and Sampler Collection in Observation Wells*. Geochemical field parameters will be measured for wells sampled by low-flow sampling techniques at the time of sample collection, including: temperature, conductivity, pH, dissolved oxygen, turbidity, and oxidation-reduction potential. The field meters used during groundwater sampling will include a water quality instrument for collection of field parameters and a electric water level meter. In accordance with the QAPP, all equipment will be calibrated and operated in accordance with the manufacturer's recommended procedures.

Dedicated sampling equipment will be used where feasible. At wells where the depth to water is greater than 30 feet, a low-flow submersible or bladder pump will need to be used. All reused sampling equipment will be decontaminated prior to, and following, sample collection in accordance with the QAPP.

## 2.4 ANALYTICAL PROGRAM

### 2.4.1 Non-radiological Parameters

The groundwater analytical program is summarized in Table 2. The bottle requirements are detailed in Table 3. The groundwater investigation will include the analysis of one or more of the following non-radiological parameters:

- Volatile Organic Compounds (VOCs) by GC/MS, SW-846 Method 8260B VOCs;
- Semi-Volatile Organic Compounds (SVOCs) by GC/MS, SW-846 Method 8270C SVOCs;
- Polychlorinated Biphenyls (PCBs) dissolved and total by GC, SW-846 Method 8082PCBs;
- Chlorinated Herbicides by GC, SW-846 Method 8151;
- Diesel Range Organics (DRO) by GC, SW-846 Method 8015B;
- Lead dissolved and total by SW-846 6010B;
- Silver dissolved and total by SW-846 6010B;

- Extractable Petroleum Hydrocarbons (EPH) – Standard/Volatile Petroleum Hydrocarbons (VPH) – Standard by MADEP Methods MADEP-EPH-98-1 and MADEP-VPH-98-1 (standard analysis excludes target analytes);
- Priority Pollutant 13 Metals (PP13) Metals by SW-846 6010B

Each well will require a different suite of the above analyses as described in Table 2. Alpha Analytical Laboratories located in Westborough, MA will perform the EPH/VPH analysis when feasible based on radiological screening. Northeast Laboratory Services, located in Waterville, Maine, will conduct all other non-radiological analyses.

Samples requiring filtration include PCBs, lead, and silver. These samples will be collected into containers as described in Table 3 and sent to the laboratory within 24 hours, or as soon as possible. Sampling personnel will indicate on the COC which samples require filtration.

#### 2.4.2 *Radiological Parameters*

Groundwater samples will also be collected for radiological site characterization activities. The radiological samples will be collected following the collection of non-radiological samples. Radiological sampling is not covered in this FSP. Framatome ANP Environmental Laboratory in Westborough, Massachusetts will conduct the radiological analyses.

#### 2.5 *SAMPLE SECURITY AND CUSTODY*

Groundwater samples will be submitted to the laboratory under proper chain-of-custody procedures. Non-radiological samples will be preserved on ice or in a refrigerator. Sample handling will be documented using chain-of-custody protocols in accordance with DP-8123, *Sample Security and Chain of Custody*.

#### 2.6 *MANAGEMENT OF INVESTIGATION DERIVED WASTES*

All purge water generated during well sampling activities will be containerized on-site. The fluids will be screened for radiological constituents. Following screening YNPS personnel will dispose of the wastes in accordance with the applicable YNPS procedures.

2.7

*SCHEDULE*

The groundwater sampling program is scheduled to begin on 1 March 2004.

### 3.0 QUALITY ASSURANCE AND QUALITY CONTROL

#### 3.1 QUALITY ASSURANCE PROJECT PLAN

A QAPP has been prepared to provide a standard method of assuring that data collected during site characterization activities is of sufficient quality to support future decisions regarding decommissioning activities and or remedial actions at the site. The primary purpose of the QAPP is to describe the means by which data collected in the field will be validated against predetermined standards, ensuring that data meets minimum quality standards prior to being used for decision-making purposes. The flow of data is important to data quality, as it ensures that appropriate project personnel have adequate opportunities to review data with importance to future site decisions. As such, the QAPP specifies the methods and means for ensuring the data generated during site characterization activities serves the purpose of site closure and property transfer.

The following provides a list of the sections of the QAPP that are most relevant to the field sampling activities:

<i>QAPP Section</i>	<i>Topic</i>
9.1	Field Investigation and Documentation Procedures
9.2	Preparation of Sample Containers
9.3	Decontamination
9.4	Field Equipment Usage and Maintenance
10.1	Sample Tracking System
10.2	Sample Custody
13.1	Field Quality Control

#### 3.2 CLEANING AND DECONTAMINATION OF EQUIPMENT

To the degree possible, dedicated and/or disposable sampling equipment will be used for sampling. Non-dedicated sampling equipment used to collect samples will be cleaned and decontaminated prior to its initial use, between each sampling location and after the final use. The following

general procedures will be adhered to concerning decontamination efforts:

1. If visual signs such as discoloration indicate that decontamination was insufficient, the equipment will again be decontaminated. If the situation persists, the equipment will be taken out of service until the situation can be corrected.
2. Verification of the non-dedicated sampling equipment cleaning procedures will be documented by the collection of field equipment rinsate blanks, at a frequency in accordance with the QAPP.
3. All properly decontaminated equipment will be stored in aluminum foil or plastic bags during storage and transport.

Decontamination protocols will be strictly adhered to in order to minimize the potential for cross-contamination between sampling locations and contamination of off-site areas. Liquids generated during the decontamination process will be collected, containerized and appropriately labeled for disposal. Waste liquids will be stored on site until determination of potential hazard class and final disposition.

Only pre-cleaned laboratory-certified sample containers will be used. The laboratory will also provide sample coolers, ice packs, trip blanks, and temperature blanks.

More specific decontamination procedures are outlined in the QAPP and SOPs.

### 3.3 *QUALITY ASSURANCE / QUALITY CONTROL SAMPLES*

The following Quality Assurance / Quality Control samples will be collected during the groundwater sampling for nonradiological samples:

- Trip blanks - One trip blank per each set of up to 20 sample containers to be analyzed for VOC and TPH-GRO. There must be at least one trip blank in every cooler used to ship samples to the laboratory for VOC and TPH-GRO analysis.
- Temperature blanks - One temperature blank per cooler. The temperature of the trip blank will be measured upon receipt of the cooler at the laboratory.
- Equipment rinsate blank - The majority of groundwater samples will be collected using dedicated sampling equipment. However, where

the depth to water is greater than 30 feet, a submersible pump will be used. A rinsate sample will be collected from the pump at a rate of one sample per 20 sampling locations. The rinsate blanks will be analyzed for the same parameters as the samples that were collected using the equipment.

- Field duplicates - Field duplicates will be collected at the rate of one duplicate per 20 samples. Samples locations where duplicates will be collected are listed in Table 2. Field duplicates will be submitted for the same analyses as the actual sample.
- Matrix spikes - Matrix spikes will be collected at the rate of one matrix spike and one matrix spike duplicate per 20 samples. Samples locations where matrix spikes will be collected are listed in Table 2. Matrix spikes/matrix spikes duplicates will be analyzed for the same analyses as the actual sample.

*PROJECT DOCUMENTATION*

Data management tasks pertinent to project documentation and records, laboratory deliverables, data reporting formats, data handling and management, and data review assessment are presented in the QAPP.

The following field sample collection records will be completed at the time of sample collection:

- Field logbook
- Groundwater sampling field logs
- Chain of custody forms
- Shipping records (airbills), if any
- Telephone logs, as appropriate

The project documentation will be provided to the Yankee Environmental Oversight Supervisor at the completion of each sampling event. In addition, any deviations from the FSP will be documented in a memorandum to the Yankee Environmental Oversight Supervisor.

NOTES:

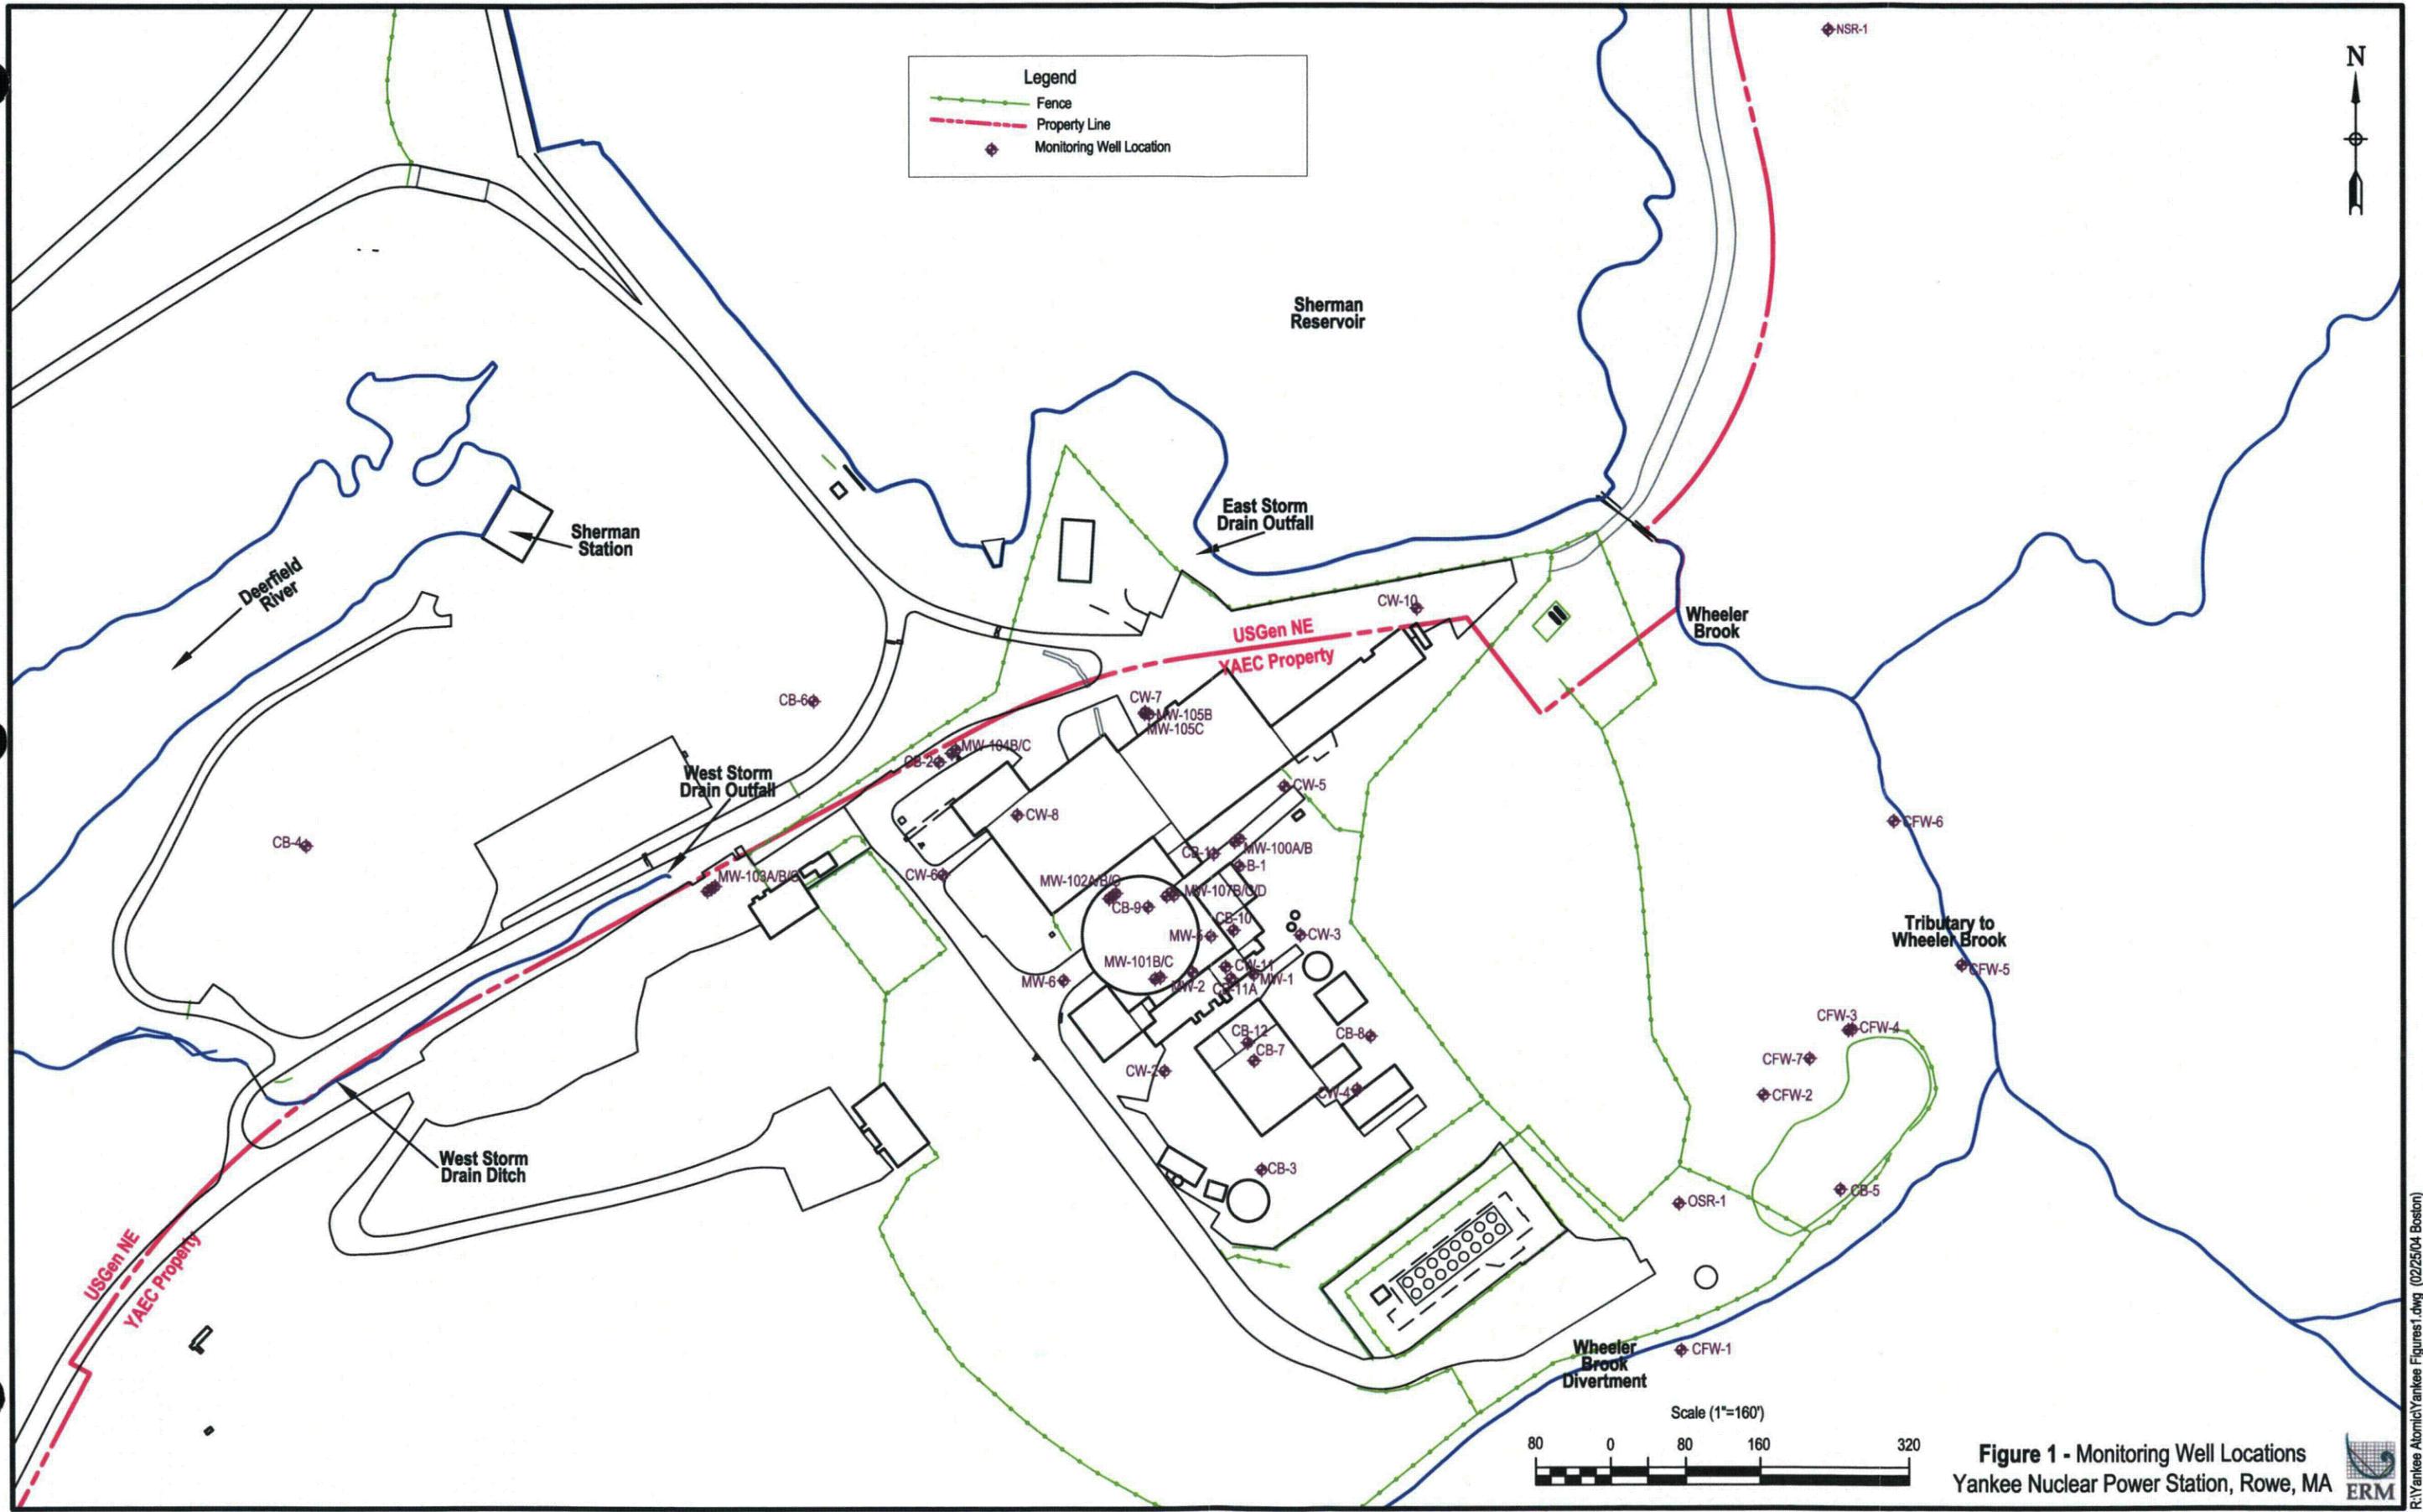

- Lead and Silver will be collected total and dissolved
- PCBs will be collected total and dissolved
- EPH/VPH sent to Alpha Laboratories
- 3 Field DUPs, 3 Matrix Spikes and 3 Matrix Spike Duplicates are needed
- One of the DUPs, MSs, and MSDs needs to come from a 104 or a 107 well

## 1.0 INTRODUCTION

### 1.1 BACKGROUND

On behalf of Yankee Atomic Electric Company (Yankee), Environmental Resources Management (ERM) has prepared this Sediment Field Sampling Plan (FSP) for the Yankee Nuclear Power Station (YNPS) located at 49 Yankee Road in Rowe, Massachusetts (Figure 1). The FSP has been prepared as a supplement to the *Draft Quality Assurance Project Plan, Site Closure, Yankee Nuclear Power Station, Rowe, Massachusetts*. The FSP outlines the approach and methods for characterizing sediment quality at the site as part of the overall site closure program. Other media-specific FSPs will be prepared as the site closure activities proceed. This FSP addresses non-radiological sediment characterization activities. Radiological characterization of sediments is not planned at this time.

### 1.2 PURPOSE & SCOPE

The purpose of the Sediment FSP is to:

- establish the procedures and rationale for sediment sampling activities in support of site closure;
- ensure that sediment sampling data are consistent with applicable procedures;
- ensure that the Data Quality Objectives (DQOs) for site closure are met; and
- support the site characterization and closure activities.

Sediment sampling for polychlorinated biphenyls (PCBs) has been performed as part of the assessment of a release of PCB-containing paint chips. Two areas of sediment are currently targeted for remediation based on the assessment activities (see Figure 1). The data generated under the FSP will be used to assess the potential for impact to sediment by oil or hazardous materials beyond the proposed remedial areas where there are no current plans for remediation.

The data generated under the FSP will be validated and input into the site database. The results from the sampling round will be used in conjunction with Data Usability reports that are being prepared regarding the historic data to determine the need for, and scope of, future sediment

sampling events. The data will also be used to support human health and ecological risk assessments that will be prepared as part of the site closure program.

The scope of the Sediment FSP includes sampling of sediments in Sherman Reservoir, Wheeler Brook, West Storm Drain, and the Deerfield River (see Table 1 for a summary of sediment sampling locations).

## 2.0 *SEDIMENT SAMPLING PROGRAM*

### 2.1 *STANDARD OPERATING PROCEDURES*

YNPS Standard Operating Procedures (SOPs) applicable to the sediment investigation include:

- DP-8124 Collection of Pond Sediment Samples for Site Characterization
- DP-8123 Sample Security and Chain of Custody
- DP-8120 Collection of Site Characterization and Site Release Samples

Appendix A contains the YNPS SOPs applicable to this FSP.

### 2.2 *SAMPLE LOCATIONS AND DESIGNATIONS*

A list of locations to be sampled for sediment is provided in Table 1. The sediment sample locations are shown in Figure 1 and background locations are shown in Figure 2.

The sampling program was developed based on the location of the YNPS National Pollution Elimination System (NPDES) outfall locations and site topography. As shown in Figure 1, YNPS has three NPDES outfall locations:

<i>Outfall</i>	<i>Processes</i>	<i>Receiving Body</i>
003/005	Stormwater from eastern portion of YNPS	Sherman Reservoir
001/010	Discharge from circulating water system and service water system	Sherman Reservoir
002/004	Stormwater from western portion of YNPS	West Storm Drain

As noted in Section 1.2, areas that are currently targeted for sediment remediation due to the release of PCB-containing paint chips are shown in Figure 1. Since it is expected that those areas will be excavated, they were excluded from the sediment characterization program.

Within Sherman Reservoir, sediment cores will be collected to a depth of 18 inches. The sediment samples will be collected at five intervals from

the shoreline: 25 feet, 50 feet, 100 feet, 200 feet, and 500 feet. A sample will be submitted for analysis from the 0 to 4 inch interval from each location. A sample will also be collected for analysis at a depth of 12 to 18 inches along the 50-foot transect. The remaining core samples will be stored in a freezer at YNPS, pending the results of the initial round of analyses.

Six background samples will be collected from the northern end of Sherman Reservoir in depositional areas. A sample will be submitted for analysis from the 0 to 4 inch interval from each location. Approximate sample locations are shown on Figure 2, but may be adjusted based on field observations.

Within Wheeler Brook, six surficial sediment samples will be collected to assess sediment quality upstream and downstream of the Southeast Construction Fill Area. Within the West Storm Drain, five surficial samples will be collected approximately every 100 feet. Within the Deerfield River, six surficial samples will be collected from depositional areas. The Deerfield River samples will be collected both upstream and downstream of the discharge point of the West Storm Drain. Surface sediment samples will be collected for analysis from 0 to 4 inches in Wheeler Brook, the West Storm Drain, and the Deerfield River.

The sediment samples will be identified using unique sample identification. The sample designations will use the naming convention as detailed in the YNPS QAPP. The sample designations for the sediment sampling program are detailed in Table 1.

## 2.3 SAMPLING PROCEDURES

### 2.3.1 Boat Sampling

Sediment samples in Sherman Reservoir will be collected under ERM's oversight by TG&B Marine Services of Falmouth, MA. Samples will be collected in compliance with YNPS Procedure *DP-8124 Collection of Pond Sediment Samples for Site Characterization*. A boat-mounted Vibracore System will be used to direct push or vibrate the core sampler into the sediment. The core sampler consists of a two-foot stainless steel casing with a removable two-inch diameter polycarbonate sleeve. A plug is placed at the top of the polycarbonate sleeve to prevent sediment from extending above the sleeve height. After coring, the sleeve is removed from the casing, capped, labeled, and brought to shore for sampling. On shore, the portion of the core to be sampled will be extracted and the remaining core will be capped, placed in a sealed plastic bag, and stored

in a freezer at YNPS. The portion of the core to be submitted for laboratory analysis will be cut open to visually inspect and classify the sediment stratigraphy. Visual observations will be logged on sediment sampling forms.

Dedicated sampling equipment will be used where feasible. Reused sampling equipment will be decontaminated prior to, and following, sample collection in accordance with the YNPS QAPP.

### 2.3.2 *Manual Sampling*

Sediment samples will be collected manually from the Wheeler Brook, the West Storm Drain, and the Deerfield River. Samples will be collected in compliance with YNPS Procedure *DP-8120 Collection of Site Characterization and Site Release Samples*. A stainless steel trowel and/or hand auger will be used to obtain each sediment sample from a depth of 0 to 4 inches. Sampling will be performed at downstream locations first, working upstream to reduce the potential for suspended sediments to impact the sample results. Field observations, including sampling location descriptions, will be recorded in a field logbook.

## 2.4 *ANALYTICAL PROGRAM*

### 2.4.1 *Non-radiological Parameters*

The sediment analytical program is summarized in Table 1. The analytical parameters were selected based on the types of chemicals used at the plant as outlined in the QAPP. In the vicinity of Outfall 001/010, the list of compounds was expanded to include chemicals associated with the operation of the cooling water system (e.g., boron, lithium, and hydrazine).

The sediment investigation will include the analysis of sediment samples for the following non-radiological parameters:

- Volatile Organic Compounds (VOCs) by GC/MS, SW-846 Method 8260B (both low-level, deionized water-preserved, and medium-level, methanol preserved, sediment samples will be collected at each sample location in accordance with SW846 Method 5035 VOC sampling procedures;
- Semi-Volatile Organic Compounds (SVOCs) by GC/MS, SW-846 Method 8270C;
- Polychlorinated Biphenyls (PCBs) by GC, SW-846 Method 8082;

- Diesel Range Organics (DRO) by GC, SW-846 Method 8015B
- Gasoline Range Organics (GRO) by GC, SW-846 Method 8015B
- Priority Pollutant 13 Metals (PP13) Metals by SW-846 6010B and 7000 Series (for antimony, arsenic, lead, selenium, and thallium). Chromium species will be identified for detections;
- Boron and Lithium by SW-846 6010B;
- Hydrazine by Ion Chromatography (IC); and
- Total Organic Carbon

Northeast Laboratory Services, located in Waterville, Maine, will conduct the majority of the non-radiological analyses. Severn Trent Laboratory (STL)-Denver will perform the hydrazine analyses, and STL-Connecticut will perform TOC analyses.

#### 2.4.2 *Radiological Parameters*

Yankee personnel will screen sediment samples on-site in accordance with YNPS screening procedures. Laboratory analysis for radiological constituents will not be performed on the sediment samples.

#### 2.5 *SAMPLE SECURITY AND CUSTODY*

Sediment samples will be submitted to the laboratory under proper chain-of-custody procedures. Samples will be preserved on ice or in a refrigerator and sample handling will be documented using chain-of-custody protocols in accordance with *DP-8123, Sample Security and Chain of Custody*.

#### 2.6 *MANAGEMENT OF INVESTIGATION DERIVED WASTES*

Sediment sampling waste will be containerized on-site. The wastes will be screened for radiological constituents. Following screening YNPS personnel will dispose of the wastes in accordance with the applicable YNPS procedures.

#### 2.7 *SCHEDULE*

The sediment-sampling program is scheduled to begin on 12 August 2003. The completion schedule for the sampling activities is dependent on field

conditions, but is scheduled to be completed within two weeks of commencement.

### 3.0 *QUALITY ASSURANCE AND QUALITY CONTROL*

#### 3.1 *QUALITY ASSURANCE PROJECT PLAN*

A QAPP has been prepared to provide a standard method of assuring that data collected during site characterization activities is of sufficient quality to support future decisions regarding decommissioning activities and or remedial actions at the site. The primary purpose of the QAPP is to describe the means by which data collected in the field will be validated against predetermined standards, ensuring that data meets minimum quality standards prior to being used for decision-making purposes. The flow of data is important to data quality, as it ensures that appropriate project personnel have adequate opportunities to review data with importance to future site decisions. As such, the QAPP specifies the methods and means for ensuring the data generated during site characterization activities is of a quality necessary to serve its intended purpose.

The following provides a list of the sections of the QAPP that are most relevant to the field sampling activities:

---

<i>QAPP Section</i>	<i>Topic</i>
9.1	Field Investigation and Documentation Procedures
9.2	Preparation of Sample Containers
9.3	Decontamination
9.4	Field Equipment Usage and Maintenance
10.1	Sample Tracking System
10.2	Sample Custody
13.1	Field Quality Control

---

#### 3.2 *CLEANING AND DECONTAMINATION OF EQUIPMENT*

To the degree possible, dedicated and/or disposable sampling equipment will be used for sampling. Non-dedicated sampling equipment used to collect samples will be cleaned and decontaminated prior to its initial use, between each sampling location and after the final use. The following

general procedures will be adhered to concerning decontamination efforts:

1. If visual signs such as discoloration indicate that decontamination was insufficient, the equipment will again be decontaminated. If the situation persists, the equipment will be taken out of service until the situation can be corrected.
2. Verification of the non-dedicated sampling equipment cleaning procedures will be documented by the collection of field equipment rinse blanks, at a frequency in accordance with the QAPP.
3. Properly decontaminated equipment will be stored in aluminum foil or plastic bags during storage and transport.

Decontamination protocols will be strictly adhered to in order to minimize the potential for cross-contamination between sampling locations and contamination of off-site areas. Liquids generated during the decontamination process will be collected, containerized and appropriately labeled for disposal. Waste liquids will be stored on site until determination of potential hazard class and final disposition.

Only pre-cleaned laboratory-certified sample containers will be used. The laboratories will also provide sample coolers, ice packs, trip blanks, and temperature blanks.

More specific decontamination procedures are outlined in the QAPP and SOPs.

### 3.3

#### *QUALITY ASSURANCE / QUALITY CONTROL SAMPLES*

The following Quality Assurance / Quality Control samples will be collected during the sediment sampling:

- Trip blanks – At least one trip blank per cooler containing VOC or GRO samples (a minimum of one trip blank per 20 samples). Separate trip blanks will be prepared and analyzed for low-level (deionized water-preserved) 8260B VOCs, medium-level (methanol preserved) 8260B VOCs, and GRO.
- Temperature blanks – One temperature blank per cooler. The temperature of the trip blank will be measured upon receipt of the cooler at the laboratory.

- Equipment rinsate blank – The majority of sediment samples will be collected using dedicated sampling equipment. However, manual sampling will be conducted using a stainless steel trowel. A rinsate sample will be collected from the stainless steel trowel at a rate of one sample per 20 sampling locations. The rinsate blanks will be analyzed for the same parameters as the samples that were collected using the equipment. Due to the short (48 hour) holding time for aqueous hydrazine analysis, samples will be sent directly to STL-Denver via overnight carrier so that the samples may be extracted as soon as possible following sampling.
- Field duplicates – Field duplicates will be collected at the rate of one duplicate per 20 samples. Samples locations where duplicates will be collected are listed in Table 1. Field duplicates will be submitted for the same analyses as the actual sample.
- Matrix spikes – Matrix spikes will be collected at the rate of one matrix spike per 20 samples. Samples locations where matrix spikes will be collected are listed in Table 1. Matrix spike/matrix spike duplicates (MS/MSDs) will be collected for organic parameters. Matrix spike/matrix duplicates (MS/MD) will be collected for inorganic and wet chemistry analyses.

*PROJECT DOCUMENTATION*

Data management tasks pertinent to project documentation and records, laboratory deliverables, data reporting formats, data handling and management, and data review assessment are presented in the QAPP.

The following field sample collection records will be completed at the time of sample collection:

- Field logbook
- Sediment sampling field logs
- Chain of custody forms
- Shipping records (airbills), if any
- Telephone logs, as appropriate

The project documentation will be provided to the Yankee Environmental Oversight Supervisor at the completion of each sampling event. In addition, any deviations from the FSP will be documented in a memorandum to the Yankee Environmental Oversight Supervisor.

COLLECTION OF POND SEDIMENT SAMPLES FOR SITE CHARACTERIZATION

SCOPE

To describe a method for collecting sediment samples from the bottom of a pond for purposes of both radiological and non-radiological analyses for YNPS site characterization.

ENCLOSURES

DP-8124 - Pgs. 1-3  
DPF-8124.1 - Rev. 3

REFERENCES

1. DP-8123, "Sample Security and Chain of Custody"
2. E-Lab 605 "E-LAB RECORD KEEPING AND RETENTION SAMPLE SUBMISSION FORM RECORDS," Framatome ANP Environmental Lab
3. AP-9601, "YNPS Site Characterization and Site Release QAPP for Non-Radiological Sample Data Quality"
4. AP-0626, "Job Hazard Assessment"

DISCUSSION

Sediment samples are collected as grab samples from the bottom of a pond, and should contain at least one kilogram of soil. Each sample is assigned a unique sample ID number.

The quality control program plan (QAPP) for non-radiological sample data quality is described in reference 3. Quality control measures are an integral part of all activities related to obtaining and testing of samples. These measures are intended to help assure the accuracy of all data. They include but are not limited to the following:

- Implementation of all work based on written procedures
- Activity direction and documentation by Assigned Site Personnel
  - Assigned Site Personnel means Safety Oversight personnel or designee
- Performance of key activities with experienced personnel
- Documentation of work in a permanent, bound field log book
- Prevention of the use of contaminated tools and materials
- Analysis of blind/duplicate samples
- Use of sample analysis labs with QA/QC programs
- Chain-of-custody documentation of samples
- DCC retention of all related documentation of samples

PREREQUISITES

Obtain the equipment/materials needed to perform the required task(s) from the following list prior to starting this procedure:

- Appropriate boat and marine safety equipment for sampling
- Chain of custody forms (DPF-8123.1).

- Permanently bound field logbook.
- Location marking supplies, buoys, line and weights; bright-colored spray paint, stakes, hammer.
- Sampling implement, ponar sampler or equal, or core sampler
- Paint cans (e.g. one gallon), zip-top poly bags (4-mil or thicker), poly core tubes with end caps, or other suitable containers for samples.
- Appropriate survey device to determine sample locations

PROCEDURE

1. Physically locate each sampling point using a depth finder to determine bottom suitability for sampling. If sampling at a location is not done immediately, mark the location with a buoy.
2. Install the appropriate sediment sampling device on the cable line of the winch.
3. Stabilize the boat at the chosen sampling location.
4. Assure proper sampler configuration prior to sampling attempt.
5. Deploy the sampler.
6. Retrieve the sampler and remove sediment sample. Repeat process as needed to obtain one kilogram of sediment, if possible, for each location. The sample may be stored in an appropriate container for shipment to the lab. If zip-top poly bags are used, double-bagging may be required.
7. Segment the sample as needed and place sample material in appropriate containers.
8. Document sample location with appropriate survey technique.
9. Label sample container with:
  - Sample I.D.
  - Date and Time
  - Initials of sampler
10. Record all appropriate information in a Permanently Bound Log Book and later transpose all pertinent information onto the sample log form, DPF-8124.1.
11. Provide a sample description for DPF-8124.1.
12. Prior to taking subsequent samples, rinse all sampling tools clean of sample material with ambient pond water.
13. Prepare chain of custody paper work, per Reference 1, for each sample.
14. Deliver samples to the YNPS Safety Oversight Department for analysis, or arrange for shipment to an alternate lab.
15. For samples submitted to the Framatome ANP Environmental Lab, form E-Lab 605.1 (Reference 2) will be filled out and sent with the samples.
16. Request a gamma isotopic analysis of the samples. Normally these samples will be analyzed to the environmental sediment lower limit of detection.

NOTE: If any of the samples contain plant related radioactivity, contact the Radwaste Coordinator for sample shipment to any off-site laboratory.

FINAL CONDITIONS

1. Collected samples and Chain-of-Custody paperwork have been delivered to the appropriate laboratory in accordance with this procedure.
2. DPF-8124.1 has been completed and filed.
3. For samples submitted to the Framatome ANP Environmental Lab, form E-Lab 605.1 will be filled out and sent with the samples.

*DP - 8123*  
*Sample Security and Chain of Custody*

SAMPLE SECURITY AND CHAIN OF CUSTODY

SCOPE

This procedure addresses sample security and chain of custody for samples collected under the procedures cited in References 1 - 7. This includes collecting radiological or non-radiological samples, site characterization samples, as well as other site samples. The sample security portion applies to all such samples. The chain of custody portions apply only to samples that are analyzed off-site.

ENCLOSURES

DP-8123 - Pgs. 1-6  
DPF-8123.1 - Rev. 7

REFERENCES

1. DP-8120, "Collection of Site Characterization and Site Release Samples"
2. DP-8121, "In-Plant Radiological Surveys to Support the Characterization Program"
3. DP-8122, "Subsurface Soil Sampling and Monitoring Well Installation"
4. DP-8124, "Collection of Pond Sediment Samples for Site Characterization"
5. DP-9725, "Potable Water Quality Monitoring"
6. DP-9745, "Ground Water Level Measurement and Sample Collection in Observation Wells"
7. DP-8813, "Sample Receipt and Preparation"

DISCUSSION

To ensure the integrity of a sample and the defensibility of its analytical results, its chain of custody should be documented. For samples analyzed off-site, this is done with the chain of custody form. For samples analyzed at the YNPS site, this is done by logging samples in and out of each on-site facility (see DP-8813). Where a sample is tracked first on one system (e.g., the Sample Log), then on another (e.g., chain of custody form), the sample's custody should be traceable, without any gaps, across both systems.

Also important is to ensure the integrity of the sample's security. Proper security will prevent or minimize sample loss, tampering and inadvertent mishandling.

PROCEDURE

- A. Initiation of Chain of Custody Form
1. A Chain of Custody Form (DPF-8123.1) shall be initiated by the sample collector for all site characterization and other site samples that are analyzed offsite. Multiple samples may be included on a single form.
  2. The sample collector shall initiate the Chain of Custody Form (DPF-8123.1) at the time of collection. Radiological samples that have been tracked in accordance with DP-8813 [7] may have their Chain of Custody Form initiated just prior to shipment off-site.

3. The sample collector shall fill out DPF-8123.1, and sign and date the form, using the guidance found in Appendix A. Ensure that the information entered on the sample container is the same as that entered on DPF-8123.1.
4. Note the chain of custody form number (found at the top of DPF-8123.1,) in the Field Log Book (if one is used).
5. Once a Chain of Custody Form has been initiated, the original copy of the form shall stay with the sample(s), at least until such time as described in Step B.3.
6. When an additional chain of custody form is to be initiated for a sample that is already on a chain of custody form (e.g., the sample has been split and each aliquot is to be sent to a different analytical laboratory), a notation shall be made in the "Comment" column on each form cross-referencing the two form numbers.

B. Transfer of Sample Custody

**NOTE:** Relinquishing custody of a sample is not required when the sample is transferred among members within any laboratory or count room, or between Chemistry, HP, or Environmental sample collectors and the site countroom or laboratory analysis.

1. When the sample collector turns the sample over to another individual (e.g., the Safety Oversight Department staff or the YNPS Sample Prep Trailer), that individual shall sign the first "Received by" block, including the date and time of receipt.
2. Each time the sample(s) changes custody, the relinquishing party and the receiving party shall sign and date the form within the next available location.
3. The analytical laboratory shall be instructed to return the white page of the completed Chain of Custody Form (DPF-8123.1) to the contact name on the form along with the analytical results.
4. The completed DPF-8123.1 shall be reviewed and filed by the contact person or his/her designee as part of the data package.

C. Use of Commercial Couriers

1. Just prior to turnover to a commercial courier, relinquish the samples by date and time of shipment and signature on DPF-8123.1.
2. Note in the "Sample Shipped Via" location on DPF-8123.1 the courier utilized if applicable and the Bill of Lading number which is printed at the top of each air bill in bold black numbers.

**NOTE:** A "Received By" signature is not required until receipt by the analytical lab.

3. Remove and retain the rear-most carbon copy of DPF-8123.1.
4. Seal the original DPF-8123.1 in the container along with the samples.
5. When the original signed DPF-8123.1 returns from the analytical lab, attach the air bill and file with sample results.

6. The completed DPF-8123.1, with air bill and rear most carbon copy shall be reviewed and filed by the contact person or his/her designee as part of the data package.

D. On-Site Sample Security

1. Following sample collection, the sample collector shall do one of the following, in accordance with the transfer of custody requirements in this procedure:
  - Deliver the sample(s) to an on-site facility (e.g., sample preparation lab or count room);
  - Deliver the sample(s) to an off-site lab (either directly or by turning over to a courier);
  - Store the sample(s) in a secure manner (see below) until the sample(s) is delivered to the on-site sample preparation facility or count room, or until the sample(s) is sent to an off-site laboratory.
2. At any time following field collection, samples must be stored in a secure manner, which shall include one or more of the following:
  - Direct physical control or under direct visual observation by an individual;
  - Storage in a locked container, locked cabinet (e.g., refrigerator), or individual locked transport box (e.g. for concrete cores).
  - Storage in a locked room or building having limited access (e.g., the YNPS Sample Prep Trailer);
  - Tamper evident seal on the sample container. A single tamper evident seal may be used on a single container (e.g., cooler) containing multiple samples.

NOTE: Smear samples shall be considered secure when loaded on a planchet rack in the Radiation Protection count room. (Tamper evident seals shall not be applied to planchet racks.) All samples shall be considered secure while on a detector in the Radiation Protection or Chemistry count room.

FINAL CONDITIONS

1. Original chain of custody forms (DPF-8123.1) have been completed and filed for all samples as identified in this procedure's "Scope". Ensure completed DPF-8123.1 is transferred to the applicable data package. Commercial courier receipts or bills of lading, if applicable, are also filed.
2. Samples that are on-site are stored in a secure manner.

APPENDIX A

FILLING OUT CHAIN OF CUSTODY FORMS

SCOPE

This appendix describes in detail the proper completion of the Chain of Custody Form (DPF-8123.1). The actual use of the form is described in the body of this procedure (DP-8123).

PROCEDURE

NOTE: All entries shall be made in black ink.

NOTE: Some entries on DPF-8123.1 may not apply to a particular sample. In such cases, an entry of "NA" (i.e., "Not Applicable") is acceptable.

NOTE: Multiple samples may be included on a single Chain of Custody form (DPF-8123.1). Multiple samples may be shipped in a single container with the only tamper evident seal(s) being on the outside of the container.

NOTE: Each chain of custody form has a unique number pre-printed in the upper right hand corner.

A. Fill out the following header information:

1. Project Name - For YNPS purposes, designate YNPS and project type. (Example for Site Characterization "YNPS S.C.")
2. YAEC Contact Name & Phone - Generally the lead or cognizant person. Use at least the first initial and full last name (e.g., "J. Smith, 413-424-XXXX").
3. Analytical Lab - The name of the analytical laboratory, with city and state. (For the Framatome/ANP Environmental Laboratory, Framatome ANP Environmental Lab may be entered (without the city and state).
4. Requested Testing Completion Date - Date to be provided by the lead or cognizant person. If standard turn around times (e.g., two weeks) have been established with outside lab, this may be left blank.

B. For each sample container, fill out each column on form DPF-8123.1. The columns include:

1. Sample Designation - Transcribe the unique sample identification number appearing on the sample container label in the space provided.
2. Date and Time - Transcribe the date (mm/dd/yyyy) and time (hhmm) the sample was collected as it appears on the container label.
3. Media Code - Enter the Media Type code from Table 1
4. Sample Type Code - Enter the Sample Type code from Table 1.
5. Container Size and Type Code - Enter the Container Size, along with the Container Type from Table 1.

For example: a) a sample for metals analysis collected in an 8-ounce plastic container will be identified as "8 oz P";  
b) a sample for radiological analysis collected in a 12"x18" ziplock plastic bag will be identified as "12x18 BP".

6. Analyses Requested - Enter the type of analyses to be performed on each sample. Use as many spaces as needed to indicate all requested analyses for a given sample.
7. Comment, Preservation - Enter any comments as necessary in this section including the preservation method used.  
  
For example, if the preservation method was acidification, identify the method in this section such as "Acidified pH<2, Nitric Acid," or "Acidified pH<2, HCl." If any sample requires cooling to 4 degrees centigrade, identify the preservation method as "Ice or 4°C".
8. Notes: Enter any other information felt to be pertinent to the collection or custody of the sample(s).
9. Signature Blocks -
  - a. Complete the signature blocks as instructed in steps A and B of this procedure.
  - b. In situations where a chain of custody form is initiated for an existing sample (For example, see step A.6. of the procedure), the first two signature blocks (#1 and #2) may be left blank.
10. Samples Shipped Via - Check off the method of shipment. If a commercial courier, enter the bill of lading number.
11. Lab Use Only -

**NOTE:** Instruction should be provided to the offsite analytical laboratory in the proper completion of the Laboratory "Lab Use Only" shaded section.

- a. Comments - made by the laboratory pertinent to the receipt and condition of samples.
- b. Lab Sample ID. - A unique laboratory tracking number.
- c. Internal Container Temp - Obtain on receipt the internal temperature of the sample container.

**NOTE:** Instructions should be provided not to obtain temperature from sample media to avoid contamination. A separate temperature blank will be provided in each shipment.

- d. Custody Sealed - Note presence or absence of custody seals.
- e. Custody Seal Intact - Note integrity of custody seals.

*Collection of Site Characterization and*  
*Site Release Samples*

COLLECTION OF SITE CHARACTERIZATION AND SITE RELEASE SAMPLES

SCOPE

To provide instructions for the collection of surface and subsurface soils, shoreline sediments, asphalt and liquids. This procedure also provides instruction for the collection of soil, asphalt and concrete from ongoing or completed excavations, and the decontamination of equipment used to collect the samples. This procedure is intended to be used during the decommissioning period for both radiological and nonradiological site characterization and site release sampling.

Concrete core sampling is addressed in Procedure DP-8121.  
Split spoon sampling is addressed in Procedure DP-8122.  
Pond sediment sampling is addressed in Procedure DP-8124.  
Groundwater monitoring is addressed in Procedure DP-9745.

ENCLOSURES

DISCUSSION

Environmental samples are collected from surface soils, subsurface soils, sediments, asphalt, and liquids to identify a media's contamination status for site characterization and site release purposes. Soil, asphalt and concrete stock piles will be sampled to determine their final disposition (e.g., soil for back fill or release, asphalt and concrete for free release). The type of sample to be collected (e.g., grab, composite, etc.) and the suite of contaminants for which it will be analyzed should be identified in the field sampling plan. All samples will be prepared for analysis in accordance with DP-8813 [9]. Free release of soil, asphalt and concrete will be in

accordance with AP-0052 [10]. This procedure addresses the steps to collect each type of sample.

Quality control measures will be an integral part of all activities related to obtaining and testing of samples. These measures are intended to help assure the accuracy of all data. They include:

- Implementation of all work based on written procedures
- Direction and documentation of all activities by a cognizant engineer
- Performance of key activities by individuals qualified to carry out such activities
- Precautions to prevent cross-contamination of samples
- Verification of analysis results by an independent laboratory
- Use of analytical laboratories with QA/QC programs
- Chain-of-custody documentation of samples

#### PRECAUTIONS

1. All samples collected from within the Radiological Control Area (RCA) will be initially handled as if contaminated. A GM frisker will be used to periodically screen equipment and newly-collected samples for gross contamination. If radioactivity is detected above background, label the sample as "Caution Radioactive Material" in accordance with OP-8100 [8] and take the necessary precautions to prevent the contamination of other samples, equipment or personnel.
2. Latex nitrile or equivalent gloves shall be worn when handling sample material collected from on site, and when cleaning tools that were used in the collection of those samples. Clean gloves shall be used at each new sampling site.
3. When collecting samples in the RCA, hands and feet should be periodically monitored for contamination with a GM frisker.
4. For safety purposes, holes in concrete floors, soil or asphalt shall be patched or filled as soon as practicable.
5. For major excavations a Job Hazards Checklist will be completed and reviewed with the Safety department.
6. Methanol is flammable, do not use in the presence of open flame or ignition sources.

#### PREREQUISITES

1. Each tool coming in contact with sampling media or any other potentially contaminated surface must be decontaminated prior to the collection of the next sample.
2. The type of sample being collected will determine which tools and materials are needed. Given below is a list of suggested tools and materials to choose from:
  - Site map
  - Chain of custody forms (DPF-8123.1)
  - Field Log Book
  - Location marking supplies, e.g., spray paint and stakes
  - 50 or 100-foot tape measure
  - Digging implements, e.g., trowel or shovel
  - Soil auger
  - Soil core sampler
  - Sample containers, e.g., "ZipTop" plastic bags or paint cans
  - Plastic bags (approx. 10 gal. size) for vegetation collection
  - Aluminum Foil
  - Hammer drill or demolition tool, with chisel or asphalt bits
  - Hearing and eye protection

- Grass clippers
- Pruning shears
- Indelible pen
- Latex (or equivalent) gloves
- GM frisker
  
- Equipment cleaning supplies:
  - Clean water
  - Brushes
  - Laboratory grade detergent (such as Alconox)
  - Paper towels
  - Trash bag for solid waste
  - Methanol
  
- Concrete coring or cutting equipment:
  - Drill rig, bits and extensions
  - Hilti drill and bits
  - Water hose
  - Electrical extension cord, w/ GFCI
  - Adjustable wrench, hammer
  - Hearing and eye protection

PROCEDURE

A. SAMPLING CONTAINERS, PRESERVATION REQUIREMENTS, AND HOLDING TIMES FOR SOIL AND LIQUID SAMPLES

The type of sample container, volume required for analysis, and the maximum holding time for various constituents and media are presented in Appendix A.

B. SOIL and SEDIMENT SAMPLING

**NOTE:** These sampling techniques are not appropriate for soil and sediment collected for Volatile Organic Analysis (VOC). In addition, stainless steel tools or equivalent are to be used for the collection of samples for nonradiological analysis.

1. If soil is under a paved area or concrete floor, remove the asphalt or concrete.
  - a. If an asphalt sample is to be collected, perform Section C before proceeding to step B.3.
  - b. If a concrete sample is to be collected, refer to Reference 1.
  
2. If required, cut vegetation to approximately the soil surface level, and remove any "litter" on the ground surface (e.g., stones or dead/dry sticks and leaves that are not part of the soil humus layer).

**NOTE:** If desired, cut vegetation may be saved for a separate analysis. In such a case, cut the vegetation over a measured area (e.g., one square meter), recording that area in the Field Log Book and place in a plastic bag.

3. Using a new or decontaminated (according to Section H of this procedure) stainless steel or equivalent tool (i.e. trowel, shovel, hand auger, etc.), remove soil or sediment at the selected sampling location (or locations for composite sampling) to the desired depth.

**NOTE:** Ideally enough soil should be collected to provide for a one liter sample after preparation.

**NOTE:** For soil samples collected outside of the Owner Controlled Area, dig a straight-sided hole with measured surface dimensions (e.g., 6" x 6") and record in the Field Log Book.

4. Place the sample into the appropriate container as specified in Appendix A. Ensure sufficient sample has been collected.
  - a. If additional soil or sediment is required due to the number and volume of samples that must be collected, obtain the soil or sediment from a location immediately adjacent to the first by following steps 1 through 3 as necessary and remove a similar amount of sample.
  - b. Composite samples collected for nonradiological analysis should be mixed in a stainless steel bowl or ziptop plastic bag.
5. Large sticks or rocks greater than approximately three inches in size should be discarded while digging the sample, unless otherwise instructed. Compensate for the lost volume at that depth by collecting additional sample from the same depth as the discarded rock/stick.

**NOTE:** Where a large rock(s) prevents the collection of an adequate sample, the sampling point should be moved slightly to allow a better sample. In such a case, the movement and its reason should be noted in the Field Log Book.

**NOTE:** Sticks and rocks less than three inches in size must remain in the sample. They will typically be removed at the laboratory during the sample preparation stage. Their weight will be accounted for at that time.

6. If required by Appendix A, preserve samples accordingly.
7. Close the container to prevent loss of material.
8. Label the container with the sample identification number (or bar code label), date of collection, time of collection, type of analysis (if non-rad), preservation method (if non-rad), and sampler's initials.
9. Ensure that the sample is secure and that the appropriate sample custody documentation (if required) is completed in accordance with DP-8123 [2] as soon as practicable.

C. ASPHALT SAMPLING

**NOTE:** Ideally enough asphalt should be collected to provide for a one liter sample after preparation.

1. Using a hammer drill or demolition tool (with the appropriate bit), a cold chisel, or any other appropriate tool, cut a circular hole in the asphalt through its entire thickness.
2. Break up the asphalt sample into small pieces with the hammer drill.

**NOTE:** Be careful when breaking up the asphalt pieces with a power tool so that excessive mixing of the asphalt rubble with the upper layer of soil does not occur.

3. Remove the asphalt pieces, taking care to minimize any dirt clinging to the pieces. Place in a suitable container.
4. If required by Appendix A, preserve accordingly.
5. Close the container.
6. Label the container with the sample identification number (or bar code label), date of collection, time of collection, and sampler's initials.
7. Ensure that the sample is secure and that the appropriate sample custody documentation (if required) is completed in accordance with DP-8123 [2] as soon as practicable.

D. LIQUID SAMPLING

1. Using the appropriate sample collection container as identified in the Table in Appendix A, collect the sample directly into the container without pre-rinsing from the liquid.
2. Submerge the lip of the sample container below the liquid surface, filling the container until a slight headspace is present. Remove from the liquid and cap.
3. Samples collected for volatile organic analysis (e.g. VOC, pesticides) must contain no headspace or air bubbles after capping. To collect these samples:
  - a. Collect the sample in a separate unused container.
  - b. Pour the water to the appropriate container using a continuous stream into a pre-preserved container; do not overflow.
  - c. When the container is full and a meniscus is present, cap the container and turn the container upside down and inspect for bubbles.
  - d. If bubbles are present, remove cap and add sample to re-establish meniscus prior to capping. Repeat as necessary.
4. If required by Appendix A, preserve accordingly if not previously provided.
5. Label the container with the sample identification number, date of collection, time of collection, and sampler's initials.
6. Ensure that the sample is secure and that the appropriate sample custody documentation (if required) is completed in accordance with DP-8123 [2] as soon as practicable.

E. IDENTIFICATION OF SAMPLING POINTS

1. If not already described in a sampling plan, describe the location of the sampling site in the Field Log Book by one of the following means:
  - Distance measurements to two or more structures (or other identifiable points)
  - Detailed drawings
  - Reference to a grid coordinate system
  - Global Positioning System (GPS) measurements
  - Any other equivalent method.
2. Mark the sample location with a semi-permanent marker (e.g., wood stake) when one of the methods in step 1 can not be used to identify the sample location.
3. A revised sample location code for radiological samples will be effective with Rev 7 of this procedure. The Safety Oversight Manager or designee will assign the first nine characters in the Location Code for each survey unit material listed using Table 1, Survey Location Codes and Appendix B, Survey Area Description, as guidance. The Location Code is composed of a 12 character alpha numeric string as follows:

Characters 1-5 = Survey Area Identification

Character 6 = Survey Unit Code

Character 7 = Survey Unit Classification Code

Character 8 = Survey Type Code

Character 9 = Material Code

Characters 10 - 12 = Survey Point

F. SAMPLING SOIL, ASPHALT, AND CONCRETE FROM EXCAVATION STOCK PILES

1. STOCK PILE SEGREGATION AND IDENTIFICATION:
  - a. Ensure that individual piles of soil, asphalt, and concrete are segregated on the following bases:
    - 1) Area of excavation - Soil, asphalt, and concrete excavated from any single area should be kept segregated from other piles until final disposition. Any pile consolidation must be documented.
    - 2) Type of material - Soil should be segregated from asphalt, concrete should be segregated from soil or asphalt. Other materials (e.g., wood, rebar, metals, or construction debris) are not addressed in this procedure and should be separated from the soil, asphalt and concrete.
    - 3) Contamination potential - Any soil, asphalt, or concrete known or suspected to be contaminated should be segregated; placed onto a poly tarp and sampled separately. This may be based on site characterization or other survey results, or on knowledge of the area's previous activities. Since site characterization surveys

have shown that soil contamination in the RCA is generally limited to the top six inches, initially, the top six-inch layer approximately should be segregated and sampled separately when excavating within the RCA.

- b. The Safety Oversight Manager or designee will assign a unique number to each soil, asphalt, or concrete stock pile, log the number and other pertinent information on form DPF-8120.1, and provide the number to the RP Technician performing the sampling.

A revised pile numbering system will be effective with Rev. 7 of this procedure. The new system will consist of a 14 digit field starting with a P, designating Pile; followed by a 4 digit field for the year; a five digit field for the survey Area ID code; a two digit field for pile type (TS for soil, AS for Asphalt, CT for concrete); and a two digit sequential pile number. This method retains all of the features of the old system while adding the Survey Area ID so that the pile number identifies the origin of the excavated material.

For example;

P2000OG021TS04 is the fourth soil pile from survey area OG021 assigned in year 2000

P2000OG021AS01 is the first asphalt pile from survey area OG021 assigned in year 2000

**NOTE:** Form DPF-8120.1 will be controlled by the Safety Oversight Manager or his designee.

- c. Prepare a suitable map to identify the location of each pile. Label the map with the pile number.
- d. Write the pile number (obtained from the Safety Oversight Manager or designee) on two wooden stakes (with a Sharpie or other indelible pen) and drive the stakes solidly into the pile (front and back).
- e. Cover each pile with a tarp to minimize the migration of potential contamination due to the forces of wind and rain, etc.
- f. Where a pile is placed on a slope, place bales of hay or silt fence on the down-slope side to catch any runoff.

**NOTE:** In the event that piles are moved, the Safety Oversight Manager or designee should be notified so that the pile's location can be tracked, and to ensure that the pile is clearly labeled in its new location. The new location should be noted on Form DPF-8120.1.

## 2. SAMPLING FROM AN EXISTING PILE:

- a. If the pile is large enough to make access to the inner volume of the pile difficult, split the pile into two or more sub-piles (e.g., with a backhoe) to allow access.

- b. Collect approximately 30 samples of at least 100cc each, placing the samples into a plastic bag (more than one (1) plastic bag will be needed). In addition to the pile's unique number the plastic bags will be numbered "1 of ##" i.e., 1 of 2, 1 of 6, etc.

**NOTE:** A roughly determined grid should be used, and a shovel should be used to allow sampling at varying depths. The goal is to systematically (i.e., uniformly) sample throughout the entire pile volume. Use a Hilti drill as necessary to break up the asphalt and concrete into small pieces. Every effort should be made to ensure that one third of the samples collected are from the surface of the asphalt being excavated.

- c. During sampling of soil piles, remove and return to the pile rocks and sticks greater than approximately 1/8 inch in size. For asphalt and concrete samples, such rocks bound up in the asphalt or concrete may be removed later during sample preparation.

**NOTE:** If any large man-made objects are encountered during sampling (e.g., barrel rings, sheet metal), remove them from the pile for separate monitoring. (Monitoring and disposition of this material is outside the scope of this procedure).

3. SAMPLING DURING EXCAVATION:

- a. By talking to the excavating contractor, determine how often samples need to be collected to achieve 30 samples from each excavation/pile. A "pile" will consist of no more than approximately 15 cubic yards of soil, asphalt, or concrete.

**NOTE:** Multiple "piles" may result from a single excavation, based on the criteria in F.1.

- b. At the frequency determined above, collect individual samples at least 100cc each directly from the bucket, placing all of these samples in a plastic bag (more than one (1) plastic bag will be needed). In addition to the stock pile's unique number the plastic bags will be numbered "1 of ##" i.e., 1 of 3, 1 of 5, etc.

**NOTE:** When the excavation is completed, 30 or more samples should have been collected from each stock pile. If not, collect enough additional samples from the stock pile (sample uniformly through the pile's volume) to achieve 30 samples.

- c. During sampling, remove and return to the pile rocks and sticks greater than approximately 1/8 inch in size. For asphalt or concrete samples, such rocks bound up in the asphalt or concrete may be removed later during sample preparation.

**NOTE:** If any large man-made objects are encountered during sampling (e.g., barrel rings, sheet metal), remove them from the pile for separate monitoring. (Monitoring and disposition of this

material is outside the scope of this procedure).

G. SAMPLE DOCUMENTATION AND HANDLING

1. If the samples are part of site characterization:
  - a. Record all appropriate information in the Field Log Book. As a minimum, include:
    - Sample date
    - Sample time
    - Sampler's name(s)
    - Sample location identification code/pile number
    - Sufficient description and/or measurements to allow the sampling site to be identified in the future.
    - map of area excavated and pile placement as appropriate.
  - b. Any deviations from this procedure that are forced by field conditions (e.g., large rocks or ledge obstructing sampling, etc.) should be noted here.
  - c. Record sampling information on DPF-8120.1 and DPF-8120.2 as appropriate.
2. If the samples are in support of site release, record sampling information in accordance with AP-0052 [10].
3. Deliver or arrange delivery of the samples to the designated sample prep or storage location, the DE&S Environmental Lab (DESEL) or another off-site analytical facility.
  - a. Ensure that a tamper evident seal is affixed to each sample container. Seals shall be initialled and dated by the preparer.
  - b. For samples submitted to the DESEL, complete form YELF 605.1 and send it with the samples.
  - c. Fill out a chain of custody form in accordance with DP-8123 [2].
  - d. Contact the Radwaste Coordinator for the shipment of any sample(s) containing plant-related radioactivity to any off-site facility.

H. DECONTAMINATION OF EQUIPMENT

**NOTE:** Decontamination is performed in three stages, generally by using three buckets as described below. The same method may be used in a sink, if available, as long as the same three-step process is used and the drain line is suitably connected for radioactively contaminated waste. The first container is used for removal of gross residue and scrubbing with detergent. The second container, half-filled with clean water, is used for the first rinse. The third container, initially empty, is used to collect the rinsate from a spray bottle, and is generally used only in areas where

contamination is suspected. Determine in advance whether the decontaminated tool is to be sprayed with methanol as a final step (non-radiological analysis only).

1. Set up three 5-gallon containers as follows:
  - a. The first container is half filled with water and a small amount of laboratory grade detergent (such as Alconox).
  - b. The second container is half-filled with clean water.
  - c. The third container is initially empty. (This container is not needed in areas where contamination is not suspected, e.g., outside the Radiological Control Area.)
2. Don a new pair of latex, nitrile or equivalent gloves.
3. Remove any gross residue from the sampling tool, letting the material (e.g., soil) fall into the hole from which it was sampled. If the sampled hole is not immediately available, save the material for appropriate waste disposal. If the tool had last been used outside the Owner Controlled Fence, the material may simply fall onto the ground.
4. Place the used sampling tool in the first container and scrub with a brush.
5. Remove the tool from the first bucket and place the tool in the second bucket. Scrub with another brush.
6. Holding the tool over the third container (or over the ground if in an area where contamination is not suspected, e.g., outside the Radiological Control Area), completely rinse the tool with a squirt bottle of Methanol or clean water.
7. Wrap the cleaned tool in new aluminum foil.
8. Remove the gloves and dispose of appropriately.
9. Place the decontamination fluids into a container labeled "Decontamination Waste". Disposal should be based on a representative sample and analysis of the water, or as prescribed by the Radiation Protection Department.

FINAL CONDITIONS

1. Samples have been collected and delivered to the appropriate laboratory in accordance with this procedure.
2. At the discretion of the Sample Manager/Senior Chemist, the YAEC Condition Reporting System, as defined in AP-0227 [11], has been initiated to report and evaluate adverse conditions potentially affecting data quality and to track corrective actions through completion.
3. Documentation has been reviewed and retained in accordance with AP-0221 [12].

REQUIREMENTS FOR CONTAINERS, PRESERVATION TECHNIQUES, SAMPLE VOLUMES, AND HOLDING TIMES (Ref. 7)

Name	Container a	Preservation b,c,d	Minimum Sample Volume or Weight	Maximum Holding Time
Alkalinity	G	4°C	100 ml	14 days
Common anions	P,G	None Required	50 ml	28 Days for Br <sup>-</sup> , F <sup>-</sup> , and SO <sub>4</sub> <sup>2-</sup> , 48 hours for NO <sub>3</sub> <sup>-</sup> , NO <sub>2</sub> <sup>-</sup> , and PO <sub>4</sub> <sup>3-</sup>
Cyanide, total and amenable to chlorination	P,G,T	4°C; NaOH to pH > 12, 0.6g ascorbic acid	500 ml each	14 days (water and soil)
Filterable residue	P,G	4°C	100 ml	7 days
Nonfilterable residue	P,G	4°C	100 ml	7 days
Hydrogen ion (pH)	P,G	None required	N/A	Analyze immediately
Nitrogen, nitrate + nitrite	P,G	4°C, H <sub>2</sub> SO <sub>4</sub> to pH < 2	100 ml	28 days
Conductance	P,G	None required	100 ml	28 days
Temperature	P,G	None required	N/A	Analyze immediately
Dissolved oxygen	G	None required	500 ml	Analyze immediately
Turbidity	P,G	4°C	100 ml	48 hours
Settleable Solids	P,G	None required	1000 ml	48 hours
Total organic carbon	P,G,T	4°C, HCl or H <sub>2</sub> SO <sub>4</sub> to pH < 2	25 ml or 10 g	28 days (water and soil)
Chromium (VI)	P,G,T	4°C	200 g	24 hours (water and soil) <sup>f</sup>
Mercury	P,G,T	HNO <sub>3</sub> to pH < 2, 4°C	100 ml or 10 g	28 days (water and soil)
Metals (except chromium (VI) and mercury) Includes Radiological .	P,G,T	HNO <sub>3</sub> to pH < 2, 4°C	200 ml or 10 g (1 liter or 500 g for radiological)	180 days (water and soil)

- a. Polyethylene (P); glass(G); brass sleeves in the sample barrel, sometimes called California brass (T).
- b. No pH adjustment for soil.
- c. Preservation with 0.008 percent Na<sub>2</sub>S<sub>2</sub>O<sub>5</sub> is only required when residual chlorine is present.
- d. Samples collected for radiological analysis do not require cooling to 4°C.
- e. Do not acidify solutions to be analyzed for isotopes of Carbon, Technicium and Iodine.
- f. The maximum recommended holding time for completion of extraction into water is 48 hours. The extract shall be analyzed within 24 hours of completion of extraction.

Name	Container	Preservation <small>b, c, d</small>	Minimum Sample Volume or Weight	Maximum Holding Time
Total petroleum hydrocarbons (TPH) - volatile	G, Teflon® - lined septum, T	4°C, HCl to pH<2	2 x 40 ml or 4 ounces	14 days (water and soil); 7 days if unpreserved by acid
Total petroleum hydrocarbons (TPH) - extractable	G, amber, T	4°C	1 liter or 8 ounces	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Volatile aromatics	G, Teflon® - lined septum, T	4°C, HCl to pH<2, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub>	2 x 40 ml or 4 ounces	14 days (water and soil); 7 days if unpreserved by acid
Halogenated volatiles	G, Teflon® - lined septum, T	4°C, HCl to pH<2, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub>	2 x 40 ml or 4 ounces	14 days (water and soil); 7 days if unpreserved by acid
Nitrosamines	G, Teflon® - lined cap, T	4°C	1 liter or 10 g	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Chlorinated herbicides	G, Teflon® - lined cap, T	4°C, pH 5-9	1 liter or 10 g	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)

a. Polyethylene (P); glass(G); brass sleeves in the sample barrel, sometimes called California brass (T).

b. No pH adjustment for soil.

c. Preservation with 0.008 percent Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> is only required when residual chlorine is present.

Name	Container	Preservation b, c, d	Minimum Sample Volume or Weight	Maximum Holding Time
Organochlorine pesticides and polychlorinated biphenyls (PCBs)	G, Teflon® - lined cap, T	4°C, pH 5-9	1 liter or 30 g	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Organophosphorus pesticides/ compounds	G, Teflon® - lined cap, T	4°C, pH 5-9	1 liter or 8 ounces	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Semivolatile organics	G, Teflon® - lined cap, T	4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>8</sub>	1 liter or 8 ounces	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Volatile organics	G, Teflon® - lined septum, T	4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>8</sub> , (HCl to pH <2 for volatile aromatics by SW8240 and SW8260) <sup>b</sup>	2 x 40 ml or 4 ounces	14 days (water and soil); 7 days if unpreserved by acid.
Polynuclear aromatic hydrocarbons (PAHs)	G, Teflon® - lined cap, T	4°C, store in dark, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>8</sub>	1 liter or 10 g	7 days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)

- a. Polyethylene (P); glass(G); brass sleeves in the sample barrel, sometimes called California brass (T).
- b. No pH adjustment for soil.
- c. Preservation with 0.008 percent Na<sub>2</sub>S<sub>2</sub>O<sub>8</sub> is only required when residual chlorine is present.

Name	Container	Preservation <small>b, c, d</small>	Minimum Sample Volume or Weight	Maximum Holding Time
Dioxins and furans	G, Teflon®- lined cap, T	4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>8</sub>	1 liter or 10 g	30 days until extraction and 45 days after extraction (water and soil)
Ethylene dibromide (EDB)	G, Teflon®- lined cap, T	4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>8</sub>	2 x 40 ml	28 days (water)
Explosive residues	P, G, T	Cool, 4°C	1 liter or 8 ounces	7 days to extraction (water), 14 days to extraction (soil); analyze within 40 days after extraction
TCLP	G, Teflon®- lined cap, T	Cool, 4°C	1 liter or 250 g	14 days to TCLP extraction and 14 days after extraction (volatiles); 14 days to TCLP extraction and 40 days after extraction (semivolatiles); 28 days to TCLP extraction and 28 days after extraction (mercury); 180 days to TCLP extraction and 180 days after extraction (metals).

- a. Polyethylene (P); glass (G); brass sleeves in the sample barrel, sometimes called California brass (T).
- b. No pH adjustment for soil.
- c. Preservation with 0.008 percent Na<sub>2</sub>S<sub>2</sub>O<sub>8</sub> is only required when residual chlorine is present.

## APPENDIX B

## SURVEY AREA DESCRIPTION

Area	Survey Area Description	Area	Survey Area Description
DG001	'A' Diesel Generator Room	SB017	Clean Maintenance Shop Tool Crib
DG002	'B' Diesel Generator Room	SB018	Clean Maintenance Shop
DG003	'C' Diesel Generator Room		
DG004	MCC Switchgear Room	SB019	Clean Maintenance Shop Mezzanine 2nd Floor
DG005	Battery Room		
DG006	Safety Injection System Area	SB020	Northeast Office Areas
DG007	Accumulator Tank Room	SB021	Service Building East Corridor
DG008	Electrical Manhole	SB022	Service Building Main Stores Area
OB001	Maintenance Pole Building	SB023	Document Control Center
OB002	Training Complex	SB024	Instrumentation Calibration Laboratory
OB003	YAEC Visitors Center		
OB004	Gate House	SB025	Service Building Southeast Stores Area
OB005	Office Building		
OB006	Pump House	SB026	Service Building Lunch Room
OB007	Modular Office Building	SB027	Second Floor Corridor
OB008	Warehouse	SB028	Second Floor West Offices
OB009	South Trailer Complex	SB029	Second Floor East Offices
OB010	North Trailer Complex	SB030	Second Floor South Offices
OB011	Security Diesel Generator Building	SB031	Mechanical Equipment Room
OE001	Southwest Structural Exteriors	SS003	Circulating Water/Service Water
OE002	Northwest Structural Exteriors	SS010	Fire Protection and Detection
OE003	North Structural Exteriors	SS016	Turbine Building Floor Drains
OE004	Northeast Structural Exteriors	SS027	Potable H2O
OE005	East Structural Exteriors	SS028	Roof Drains i/s OCA and o/s RCA
OE006	Warehouse Exterior	SS029	Roof Drains i/s RCA
OG001	Northwest Buffers Zone	SS030	Misc. Ventilation
OG002	Northeast Buffers Zone	TB001	Southwest Stairwell - Ground Floor
OG003	Southeast Buffers Zone	TB002	Boiler Feed Pump Area - West
OG004	Southwest Buffers Zone	TB003	Boiler Feed Pump Area - East
OG005	Switch Yard Area	TB004	Turbine Building Elevator/Machine Room
OG006	Southwest Open Land Area		
OG007	South Open Land Area	TB005	Heating and Boiler Room
OG008	Southeast Construction Fill Area	TB006	Ground Floor - Southeast General Area
OG009	East Open Land Area	TB007	Ground Floor - South Central General Area
OG010	Northeast Open Land Area		
OG011	North Open Land Area	TB008	Ground Floor - Southwest General Area

**DECOMMISSIONING EXCAVATION  
SAMPLE RESULTS AND PILE DESCRIPTION**

Pile Number \_\_\_\_\_ Date/Time of Sample Collection \_\_\_\_\_ / \_\_\_\_\_

Samplers Name \_\_\_\_\_

Soil [    ]   
Asphalt [    ]   
Concrete [    ]

Part 1:     **LABORATORY RESULTS**

Sample Number	Spectrum Number	Net Positive Activity (pCi/g)		Fraction of Guideline <sup>2</sup> (Each Nuclide)	Sum of Fractions <sup>2</sup> (Total Sample)
		Nuclides	Concentration <sup>1</sup>		

<sup>1</sup> "ND" indicates no positive activity detected

<sup>2</sup> Soil only

Evaluation performed by \_\_\_\_\_ Date \_\_\_\_\_

Part 2:     **DISPOSITION OF MATERIAL**

The determination of acceptance of material for unconditional release is accomplished utilizing AP-0052.

Disposition of pile: \_\_\_\_\_ Date: \_\_\_\_\_

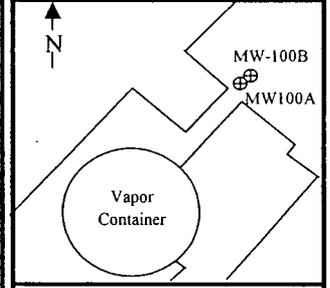

Final Review by: \_\_\_\_\_ Date: \_\_\_\_\_  
(RP Supervision)

91				3'-5': Dark Gray, very dense, poorly sorted SILT and CLAY, some angular Cobbles/Pebbles; dry.				
92								
93	SAND & SILT	5'	2.5'	0-1.5': Gray to dark Gray-Brown, loose, moderately poorly sorted SILT, little rounded Pebbles, Cobbles, little Boulders; wet.	100'-105'	4.1		
94				1.5'-2.5': Brown to Gray-Brown, loose, well sorted, coarse SAND, little to trace Clay, trace angular Cobbles; wet.				
95								

NOTES:

<sup>1</sup>: Higher FID hits attributed to melted poly sleeve

<sup>2</sup>: Similar or equal to background levels

<sup>3</sup>: Eberline Frisker yielded reading of ~250 cpm--further analysis attributed activity to naturally-occurring Actinium-228

\*Results of on-Site radiological screening <MDL unless otherwise noted
