Docket No. 50-275, OL-DPR-80  
Diablo Canyon Unit 1  
Core Operating Limits Report Unit 1, Cycle 15

Dear Commissioners and Staff:

In accordance with Diablo Canyon Power Plant Technical Specification 5.6.5.d, enclosed are the Core Operating Limits Report (COLR) for Unit 1, Cycle 15, Revision 0 and Revision 1. Note, Revision 1 was effective prior to the start of Unit 1, Cycle 15.

There are no new or revised regulatory commitments in this report.

If there are any questions regarding the COLR for Unit 1, Cycle 15, please contact Mr. Larry Parker at (805) 545-3386.

Sincerely,

James R. Becker

CORE OPERATING LIMITS REPORT PAGE 1 OF 12  
UNIT

TITLE: COLR for Diablo Canyon Unit 1 Cycle 15

1

5/15/07  
EFFECTIVE DATE

PROCEDURE CLASSIFICATION: QUALITY RELATED

1. CORE OPERATING LIMITS REPORT

This Core Operating Limits Report (COLR) for Diablo Canyon Unit 1 Cycle 15 has been prepared in accordance with the requirements of Technical Specification (TS) 5.6.5.

The Technical Specifications affected by this report are listed below:

- 3.1.1 - Shutdown Margin (MODE 2 with  $k_{eff} < 1.0$ , MODES 3, 4, and 5)
- 3.1.3 - Moderator Temperature Coefficient
- 3.1.4 - Rod Group Alignment Limits
- 3.1.5 - Shutdown Bank Insertion Limits
- 3.1.6 - Control Bank Insertion Limits
- 3.2.1 - Heat Flux Hot Channel Factor -  $F_Q(Z)$
- 3.2.2 - Nuclear Enthalpy Rise Hot Channel Factor -  $F_{AH}^N$
- 3.2.3 - Axial Flux Difference - (AFD)
- 3.9.1 - Boron Concentration

2. OPERATING LIMITS

The cycle-specific parameter limits for the TS listed in Section 1 are presented in the following subsections. These limits have been developed using the NRC-approved methodologies specified in TS 5.6.5.

2.1 Shutdown Margin (SDM) (TS 3.1.1)

The SDM limit for MODE 2 with  $k_{eff} < 1.0$ , MODES 3 and 4 is:

- 2.1.1 The shutdown margin with Safety Injection enabled shall be greater than or equal to 1.6%  $\Delta k/k$ .
- 2.1.2 In Modes 3 or 4 the shutdown margin with Safety Injection blocked shall be greater than or equal to 1.6%  $\Delta k/k$  calculated at a temperature of 200°F.

The SDM limit for MODE 5 is:

- 2.1.3 The shutdown margin shall be greater than or equal to 1.0%  $\Delta k/k$ . However, an administrative value of 1.6 %  $\Delta k/k$  will be used to address concerns of NSAL-02-014.

2.2 Shutdown Margin (SDM) (TS 3.1.4, 3.1.5, 3.1.6)

The SDM for MODE 1 and MODE 2 with  $k_{eff} \geq 1.0$  is:

- 2.2.1 The shutdown margin shall be greater than or equal to 1.6%  $\Delta k/k$ .

PACIFIC GAS AND ELECTRIC COMPANY  
DIABLO CANYON POWER PLANT

NUMBER COLR 1-15  
REVISION 0  
PAGE 2 OF 12

TITLE: COLR for Diablo Canyon Unit 1 Cycle 15

UNIT 1

2.3 Moderator Temperature Coefficient (MTC) (TS 3.1.3)

The MTC limit for MODES 1, 2, and 3 is:

- 2.3.1 The MTC shall be less negative than  $-3.9 \times 10^{-4} \Delta k/k/\text{°F}$  for all rods withdrawn, end of cycle life (EOL), RATED THERMAL POWER condition.
- 2.3.2 The MTC 300 ppm surveillance limit is  $-3.0 \times 10^{-4} \Delta k/k/\text{°F}$  (all rods withdrawn, RATED THERMAL POWER condition).
- 2.3.3 The MTC 60 ppm surveillance limit is  $-3.72 \times 10^{-4} \Delta k/k/\text{°F}$  (all rods withdrawn, RATED THERMAL POWER condition).

2.4 Shutdown Bank Insertion Limits (TS 3.1.5)

- 2.4.1 Each shutdown bank shall be withdrawn to at least 225 steps.

2.5 Control Bank Insertion Limits (TS 3.1.6)

- 2.5.1 The control banks shall be limited in physical insertion as shown in Figure 1.

2.6 Heat Flux Hot Channel Factor –  $F_Q(Z)$  (TS 3.2.1)

$$2.6.1 F_Q(Z) < \frac{F_Q^{RTP}}{P} * K(Z) \quad \text{for } P > 0.5$$

$$F_Q(Z) < \frac{F_Q^{RTP}}{0.5} * K(Z) \quad \text{for } P \leq 0.5$$

where:  $P = \frac{\text{THERMAL POWER}}{\text{RATED THERMAL POWER}}$

$$F_Q^{RTP} = 2.58$$

$$K(Z) = 1.0$$

NOTE: The  $W(Z)$  data is appropriate for use only if the predicted axial offset is within  $\pm 3\%$  of the measured value.

- 2.6.2 The  $W(Z)$  data for Relaxed Axial Offset Control (RAOC) operation, provided in Tables 2A and 2B are sufficient to determine the RAOC  $W(Z)$  versus core height for Cycle 15 burnups through the end of full power reactivity plus a power coast down of up to 1000 MWD/MTU.

Table 1 shows  $F_Q$  margin decreases that are greater than 2% per 31 Effective Full Power Days (EFPD). These values shall be used to increase  $F_Q^W(Z)$  per SR 3.2.1.2. A 2% penalty factor shall be used at all cycle burnups that are outside the range of Table 1.

TITLE: COLR for Diablo Canyon Unit 1 Cycle 15

UNIT 1

2.6.3  $F_Q(Z)$  shall be evaluated to determine if it is within its limits by verifying that  $F_Q^C(Z)$  and  $F_Q^W(Z)$  satisfy the following:

- a. Using the moveable incore detectors to obtain a power distribution map in MODE 1.
- b. Increasing the measured  $F_Q(Z)$  component of the power distribution map by 3% to account for manufacturing tolerances and further increasing the value by 5% to account for measurement uncertainties.
- c. Satisfying the following relationship:

$$F_Q^C(Z) < \frac{F_Q^{RTP} * K(Z)}{P} \quad \text{for } P > 0.5$$

$$F_Q^C(Z) \leq \frac{F_Q^{RTP} * K(Z)}{0.5} \quad \text{for } P \leq 0.5$$

$$F_Q^W(Z) < \frac{F_Q^{RTP}}{P} * K(Z) \quad \text{for } P > 0.5$$

$$F_Q^W(Z) \leq \frac{F_Q^{RTP}}{0.5} * K(Z) \quad \text{for } P \leq 0.5$$

where:

$F_Q^C(Z)$  is the measured  $F_Q(Z)$  increased by the allowances for manufacturing tolerances and measurement uncertainty.

$F_Q^{RTP}$  is the  $F_Q$  limit

$K(Z)$  is the normalized  $F_Q(Z)$  as a function of core height

$P$  is the relative THERMAL POWER, and

$F_Q^W(Z)$  is the total peaking factor,  $F_Q^C(Z)$ , multiplied by  $W(Z)$  which gives the maximum  $F_Q(Z)$  calculated to occur in normal operation.

$W(z)$  is the cycle dependent function that accounts for power distribution transients encountered during normal operation.

$F_Q^{RTP}$  and  $K(Z)$  are specified in 2.6.1 and  $W(Z)$  is specified in 2.6.2.

REVISION 0  
PAGE 4 OF 12

TITLE: COLR for Diablo Canyon Unit 1 Cycle 15

UNIT 1

2.7 Nuclear Enthalpy Rise Hot Channel Factor -  $F_{\Delta H}^N$  (TS 3.2.2)

$$F_{\Delta H}^N \leq F_{\Delta H}^{RTP} * [1 + PF_{\Delta H} * (1-P)]$$

where:

$$P = \frac{\text{THERMAL POWER}}{\text{RATED THERMAL POWER}}$$

$F_{\Delta H}^N$  = Measured values of  $F_{\Delta H}^N$  obtained by using the moveable incore detectors to obtain a power distribution map.

$F_{\Delta H}^{RTP}$  = 1.59 (includes the 4% measurement uncertainty)

$PF_{\Delta H}$  = 0.3 = Power Factor Multiplier

2.8 Power Distribution Measurement Uncertainty (TS 3.2.1. and TS 3.2.2):

If the Power Distribution Monitoring System (PDMS) is OPERABLE, the uncertainty,  $U_{F_{\Delta H}}$ , to be applied to the Nuclear Enthalpy Rise Hot Channel Factor,  $F_{\Delta H}^N$ , shall be calculated by the following formula:

$$U_{F_{\Delta H}} = 1.0 + \frac{U_{\Delta H}}{100.0}$$

where:  $U_{\Delta H}$  = Uncertainty for enthalpy rise as defined in equation (5-19) in Reference 6.2 and  $F_{\Delta H}^{RTP}$  = 1.65 for PDMS (in the above Section 2.7 equation).

If the PDMS is OPERABLE, the uncertainty,  $U_{FQ}$ , to be applied to the Heat Flux Hot Channel Factor,  $F_Q(z)$ , shall be calculated by the following formula:

$$U_{FQ} = \left( 1.0 + \frac{U_Q}{100.0} \right) * U_e$$

where:  $U_Q$  = Uncertainty for power peaking factor as defined in equation (5-19) in Reference 6.2.

$U_e$  = Engineering uncertainty factor  
= 1.03

If the PDMS is inoperable, the Nuclear Enthalpy Rise Hot Channel Factor,  $F_{\Delta H}^N$ , shall be calculated as specified in Section 2.7.

If the PDMS is inoperable, the Heat Flux Hot Channel Factor,  $F_Q(Z)$ , shall be calculated as specified in Section 2.6.

2.9 Axial Flux Difference (TS 3.2.3)

2.9.1 The Axial Flux Difference (AFD) Limits are provided in Figure 2.

2.10 Boron Concentration (TS 3.9.1)

The refueling boron concentration of the Reactor Coolant System, the refueling canal, and the refueling cavity shall be maintained within the more restrictive of the following limits:

2.10.1 A  $k_{eff}$  of 0.95 or less, with the most reactive control rod assembly completely withdrawn, or

2.10.2 A boron concentration of greater than or equal to 2000 ppm.

PROCEDURE CLASSIFICATION: QUALITY RELATED

1. CORE OPERATING LIMITS REPORT

This Core Operating Limits Report (COLR) for Diablo Canyon Unit 1 Cycle 15 has been prepared in accordance with the requirements of Technical Specification (TS) 5.6.5.

The Technical Specifications affected by this report are listed below:

- 3.1.1 - Shutdown Margin (MODE 2 with  $k_{eff} < 1.0$ , MODES 3, 4, and 5)
- 3.1.3 - Moderator Temperature Coefficient
- 3.1.4 - Rod Group Alignment Limits
- 3.1.5 - Shutdown Bank Insertion Limits
- 3.1.6 - Control Bank Insertion Limits
- 3.2.1 - Heat Flux Hot Channel Factor -  $F_Q(Z)$
- 3.2.2 - Nuclear Enthalpy Rise Hot Channel Factor -  $F_{\Delta H}^N$
- 3.2.3 - Axial Flux Difference - (AFD)
- 3.9.1 - Boron Concentration

2. OPERATING LIMITS

The cycle-specific parameter limits for the TS listed in Section 1 are presented in the following subsections. These limits have been developed using the NRC-approved methodologies specified in TS 5.6.5.

2.1 Shutdown Margin (SDM) (TS 3.1.1)

The SDM limit for MODE 2 with  $k_{eff} < 1.0$ , MODES 3 and 4 is:

- 2.1.1 The shutdown margin with Safety Injection enabled shall be greater than or equal to 1.6%  $\Delta k/k$ .
- 2.1.2 In Modes 3 or 4 the shutdown margin with Safety Injection blocked shall be greater than or equal to 1.6%  $\Delta k/k$  calculated at a temperature of 200°F.

The SDM limit for MODE 5 is:

- 2.1.3 The shutdown margin shall be greater than or equal to 1.0%  $\Delta k/k$ . However, an administrative value of 1.6 %  $\Delta k/k$  will be used to address concerns of NSAL-02-014.

2.2 Shutdown Margin (SDM) (TS 3.1.4, 3.1.5, 3.1.6)

The SDM for MODE 1 and MODE 2 with  $k_{eff} \geq 1.0$  is:

- 2.2.1 The shutdown margin shall be greater than or equal to 1.6%  $\Delta k/k$ .

- 2.3 Moderator Temperature Coefficient (MTC) (TS 3.1.3)  
The MTC limit for MODES 1, 2, and 3 is:
- 2.3.1 The MTC shall be less negative than  $-3.9 \times 10^{-4} \Delta k/k^{\circ}\text{F}$  for all rods withdrawn, end of cycle life (EOL), RATED THERMAL POWER condition.
- 2.3.2 The MTC 300 ppm surveillance limit is  $-3.0 \times 10^{-4} \Delta k/k^{\circ}\text{F}$  (all rods withdrawn, RATED THERMAL POWER condition).
- 2.3.3 The MTC 60 ppm surveillance limit is  $-3.72 \times 10^{-4} \Delta k/k^{\circ}\text{F}$  (all rods withdrawn, RATED THERMAL POWER condition).
- 2.4 Shutdown Bank Insertion Limits (TS 3.1.5)
- 2.4.1 Each shutdown bank shall be withdrawn to at least 225 steps.
- 2.5 Control Bank Insertion Limits (TS 3.1.6)
- 2.5.1 The control banks shall be limited in physical insertion as shown in Figure 1.
- 2.6 Heat Flux Hot Channel Factor –  $F_Q(Z)$  (TS 3.2.1)

$$2.6.1 F_Q(Z) < \frac{F_Q^{RTP}}{P} * K(Z) \quad \text{for } P > 0.5$$

$$F_Q(Z) < \frac{F_Q^{RTP}}{0.5} * K(Z) \quad \text{for } P \leq 0.5$$

where:  $P = \frac{\text{THERMAL POWER}}{\text{RATED THERMAL POWER}}$

$$F_Q^{RTP} = 2.58$$

$$K(Z) = 1.0$$

**NOTE:** The W(Z) data is appropriate for use only if the predicted axial offset is within  $\pm 3\%$  of the measured value.

- 2.6.2 The W(Z) data for Relaxed Axial Offset Control (RAOC) operation, provided in Tables 2A and 2B are sufficient to determine the RAOC W(Z) versus core height for Cycle 15 burnups through the end of full power reactivity plus a power coast down of up to 1000 MWD/MTU.

Table 1 shows  $F_Q$  margin decreases that are greater than 2% per 31 Effective Full Power Days (EFPD). These values shall be used to increase  $F_Q^W(Z)$  per SR 3.2.1.2. A 2% penalty factor shall be used at all cycle burnups that are outside the range of Table 1.

2.6.3  $F_Q(Z)$  shall be evaluated to determine if it is within its limits by verifying that  $F_Q^C(Z)$  and  $F_Q^W(Z)$  satisfy the following:

- a. Using the moveable incore detectors to obtain a power distribution map in MODE 1.
- b. Increasing the measured  $F_Q(Z)$  component of the power distribution map by 3% to account for manufacturing tolerances and further increasing the value by 5% to account for measurement uncertainties.
- c. Satisfying the following relationship:

$$F_Q^C(Z) < \frac{F_Q^{RTP} * K(Z)}{P} \quad \text{for } P > 0.5$$

$$F_Q^C(Z) \leq \frac{F_Q^{RTP} * K(Z)}{0.5} \quad \text{for } P \leq 0.5$$

$$F_Q^W(Z) < \frac{F_Q^{RTP}}{P} * K(Z) \quad \text{for } P > 0.5$$

$$F_Q^W(Z) \leq \frac{F_Q^{RTP}}{0.5} * K(Z) \quad \text{for } P \leq 0.5$$

where:

$F_Q^C(Z)$  is the measured  $F_Q(Z)$  increased by the allowances for manufacturing tolerances and measurement uncertainty.

$F_Q^{RTP}$  is the  $F_Q$  limit

$K(Z)$  is the normalized  $F_Q(Z)$  as a function of core height

$P$  is the relative THERMAL POWER, and

$F_Q^W(Z)$  is the total peaking factor,  $F_Q^C(Z)$ , multiplied by  $W(Z)$  which gives the maximum  $F_Q(Z)$  calculated to occur in normal operation.

$W(z)$  is the cycle dependent function that accounts for power distribution transients encountered during normal operation.

$F_Q^{RTP}$  and  $K(Z)$  are specified in 2.6.1 and  $W(Z)$  is specified in 2.6.2.

TITLE: COLR for Diablo Canyon Unit 1 Cycle 15

UNIT 1

2.7 Nuclear Enthalpy Rise Hot Channel Factor -  $F_{\Delta H}^N$  (TS 3.2.2)

$$F_{\Delta H}^N \leq F_{\Delta H}^{RTP} * [1 + PF_{\Delta H} * (1-P)]$$

where:

$$P = \frac{\text{THERMAL POWER}}{\text{RATED THERMAL POWER}}$$

$F_{\Delta H}^N$  = Measured values of  $F_{\Delta H}^N$  obtained by using the moveable incore detectors to obtain a power distribution map.

$F_{\Delta H}^{RTP}$  = 1.59 (includes the 4% measurement uncertainty)

$PF_{\Delta H}$  = 0.3 = Power Factor Multiplier

2.8 Power Distribution Measurement Uncertainty (TS 3.2.1. and TS 3.2.2):

If the Power Distribution Monitoring System (PDMS) is OPERABLE, the uncertainty,  $U_{F_{\Delta H}}$ , to be applied to the Nuclear Enthalpy Rise Hot Channel Factor,  $F_{\Delta H}^N$ , shall be calculated by the following formula:

$$U_{F_{\Delta H}} = 1.0 + \frac{U_{\Delta H}}{100.0}$$

where:  $U_{\Delta H}$  = Uncertainty for enthalpy rise as defined in equation (5-19) in Reference 6.2 and  $F_{\Delta H}^{RTP}$  = 1.65 for PDMS (in the above Section 2.7 equation).

If the PDMS is OPERABLE, the uncertainty,  $U_{F_Q}$ , to be applied to the Heat Flux Hot Channel Factor,  $F_Q(z)$ , shall be calculated by the following formula:

$$U_{F_Q} = \left( 1.0 + \frac{U_Q}{100.0} \right) * U_e$$

where:  $U_Q$  = Uncertainty for power peaking factor as defined in equation (5-19) in Reference 6.2.

$U_e$  = Engineering uncertainty factor

$$= 1.03$$

If the PDMS is inoperable, the Nuclear Enthalpy Rise Hot Channel Factor,  $F_{\Delta H}^N$ , shall be calculated as specified in Section 2.7.

If the PDMS is inoperable, the Heat Flux Hot Channel Factor,  $F_Q(Z)$ , shall be calculated as specified in Section 2.6.

2.9 Axial Flux Difference (TS 3.2.3)

2.9.1 The Axial Flux Difference (AFD) Limits are provided in Figure 2.

2.10 Boron Concentration (TS 3.9.1)

The refueling boron concentration of the Reactor Coolant System, the refueling canal, and the refueling cavity shall be maintained within the more restrictive of the following limits:

2.10.1 A  $k_{\text{eff}}$  of 0.95 or less, with the most reactive control rod assembly completely withdrawn, or

2.10.2 A boron concentration of greater than or equal to 2000 ppm.
