Tube Drawing

Per your request an examination of the temperature in the operating environment of all of our nuclear devices has been conducted. Device casing temperatures were measured at various casing locations on each of our operating devices. The highest temperature found was at the extreme hot face of one unit on a 95 degree F day and was 355 F. I am confident that the suggested maximum value of 400 F is not being exceeded in any of our existing installations as other casing surface locations of even this hottest device were as low as 150 F.
