UNION CARBIDE AND CARBON CORPORATION

### UEC

SOUTH CHARLESTON 3, W. VA.

September 17, 1956

United States Atomic Energy Commission Isotopes Division Post Office Box E Oak Ridge, Tennessee

#### Subject: Cobalt-60

Gentlemen:

1. Sp. 1

Please find attached two (2) copies of our "Application for Byproduct Material License", Form AEC-313, and one (1) copy of Form AECL-247, which is an "Application for Radioactive Isotopes", for use outside of Canada. According to procedure A-4 (R), these forms are to be sent to you and in turn you will issue Form AEC-374 entitled "By-Product Material Licence". The firm from which we are purchasing this material is the Atomic Energy of Canada, Ltd., Commercial Products Div., P. O. Box 93, Ottawa, Canada.

Our Purchase Order No. 514-19227-R is being issued today, therefore, your prompt processing of our application will be appreciated.

Very truly yours,

Alginen

Works Purchasing Department

Item 10(b)

### (1) <u>Description of Facility</u>

The housing for the cobalt-60 will consist of a chamber surrounded on all sides by 4 feet of concrete of density 2.37, or its equivalent in shielding value for cobalt-60 gamma rays. The source will be stored at the bottom of a water-filled pool 12 feet deep in the floor of this chamber. The source will be assembled by lowering the shipping container into the filled pool, removing the cover under water, and then removing the source proper, under water at all times, to a platform whose position is controlled by an elevator operated remotely. This assembly will be done by means of a gripping tong at least 12 feet long. The water provides more than adequate shielding for the operation.

11-260

Entry to the radiation chamber is by a labyrinthine passage terminated by a steel gate which will be locked when the source is raised. Mirrors will permit observation of experiments under way in the chamber when the source is raised to its operating position. The barrier-gate lock and source-raising mechanism will be electrically interlocked so that the source cannot be raised except when the gate is locked nor can the gate be opened until the source is lowered into the water pool. The gate will also be interlocked with the water-level in the pool so that, if it is inadvertantly drained, the cell cannot be entered. When the source is elevated, a flashing red light visible in the control room and an audible alarm in the cell will be activated. The barrier-gate will open easily from the inside at all times. A telephone inside the gate connected to the main laboratory switchboard will also be provided.

In the event of mechanical failure of the source elevator, means will be provided for transferring the source to a shielded storage box at the bottom of the pool. This will be covered with a lead plug and the water drained to permit safe access to the elevator mechanism.

5130

Item 10(b)

Continuous check on the exposure of staff to radiation and a permanent record of exposure will be provided by a conventional film badge service. For immediate checking of exposure, pocket dosemeters will be worn by all personnel while in the radiation laboratory. Visitors will be provided with pocket ionization chambers. Persons entering the radiation cell will be required to carry a hand monitor which gives a continuous and sensitive indication of dose rate. Further protection will be provided by a continuous area monitoring system. This will provide permanent record of the radiation intensity in the control room area, and in the cell when the gate is raised. The latter ionization chamber will provide warning if the radiation level in the cell is above 20 mr./hr. It will be provided primarily to cover the unlikely contigency of the source pencils becoming detached from their holders and being left behind when the source is lowered. Fusible links will provide for automatic lowering of the source and operation of a fire-extinguishing system in the cell, which may also be operated manually from outside the shield.

(3) The calculated gamma ray dose in areas designated by numbered points in shield drawing, accessible only to radiation workers.

Number	Location	Dosage, mr/hr 0.65		
1.	Directly against outer shield wall in control room and outside building to East			
2	At laboratory bench in control room	less than 0.1		
3	At office desk	less than 0.08		
4	At gate to labyrinthine entrance	less than 0.08		
5	Area adjacent to SW side of radiation shield	0.65		
6	Area adjacent to S side of radiation shield	0.36		

continued next page

2 -

47-260-1

Number	Location	<u>Dosage, mr/hr</u>
7	At surface of water above source in lowered position	0.001
8	At bottom of pool, source in emergency storage	less than 0.6
9	11.	less than 0.9
10	#	less than 0.8

A plot plan of the proposed site for the radiation laboratory to house the cobalt-60 source is shown on Figure No. 2, attached. The area, inhabited on a 40 hour per week schedule, nearest to the radiation laboratory is the NE corner of the building marked High Pressure Laboratory. The calculated gamma ray dose rates here and in other areas accessible to other than radiation workers at points indicated on the plot plan are:

Number	Location	<u>Dosage, mr/hr</u>
11	NE corner High Pressure Laboratory	0.00006
12	Incinerator (manned approx. 2 hrs/week)	0.0003
13	Cooling tower (unmanned)	0.00038
14	Outside fence enclosing Rad. L	ab. 0.0014

The area to the South and East of the proposed site is private property belonging to Carbide and Carbon Chemicals Company. 47-260-
