

PSHA, Site Response, and Site Spectra

Technical Presentation

Rockville, MD

August 28, 2007

TOPIC 3: Site Hazard

Robin K. McGuire

Gabriel R. Toro

Risk Engineering, Inc.

Boulder, Colorado

Technical Presentation, 08/28/07, 1/51

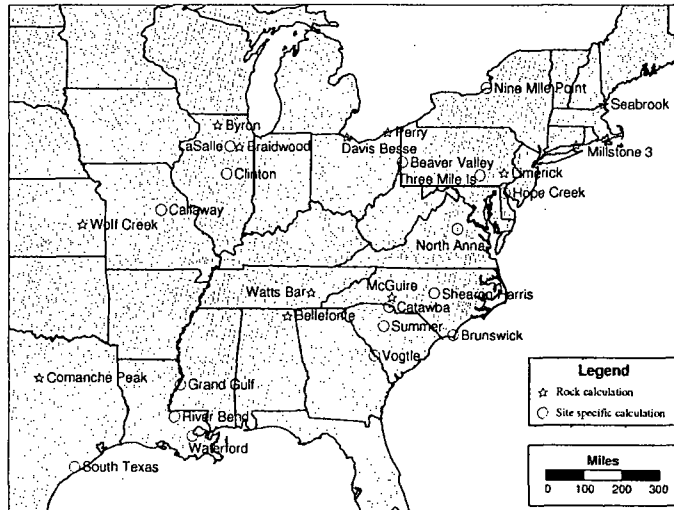

Topic 3: Site hazard

- Typical hazard curves, effect of revised σ and CAV
- Deaggregation for high and low frequencies
- Effect of site response: how to convert rock hazard to site hazard (Approaches 1, 2A, 2B, 3, 4)

Technical Presentation, 08/28/07, 2/51

28 sites used for hazard comparisons

Technical Presentation, 08/28/07, 17/51

Mean and Median Reductions in ASCE DRS from CAV Filter at Each Structural Frequency

Frequency, Hz	Mean Reduction	Median Reduction
PGA (100)	10.4%	7.7%
25	13.2%	10.1%
10	12.2%	9.6%
5	12.6%	10.3%
2.5	15.0%	11.9%
1	18.0%	15.1%
0.5	19.8%	17.4%

Technical Presentation, 08/28/07, 18/51

Observations about CAV

- Affects 10^{-4} ground motion more than 10^{-5} ground motion
- Little effect for sites dominated by Charleston & New Madrid sources
- Large effect for sites where hazard is low
- Major effect at sites with hazard dominated by frequent, small earthquakes

Technical Presentation, 08/28/07, 22/51

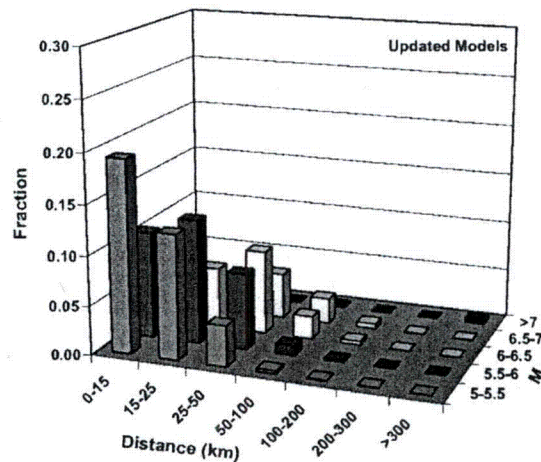

Hard Rock UHS and Deaggregation

- Deaggregation shows what earthquakes (M and R) contribute to high- and low-frequency parts of the design spectrum
- Two earthquakes required in RG 1.165
- Use of broad-banded spectrum may be unconservative for site response
- Should calculate site response with HF input motion and LF input motion, and envelop response

Method 2

Critical step: use appropriate M and R

	Overall		R < 100 km		R > 100 km	
	M	R	M	R	M	R
10 ⁻⁴ HF	7.0	260	5.6	22	7.7	360
10 ⁻⁴ LF	7.5	330	5.9	23	7.7	360
10 ⁻⁵ HF	6.0	90	5.6	14	7.7	360
10 ⁻⁵ LF	7.4	290	6.0	18	7.7	360
10 ⁻⁶ HF	5.8	31	5.7	12	8.1	320
10 ⁻⁶ LF	7.1	220	6.2	15	7.8	360

Technical Presentation, 08/28/07, 32/51

Method 2 (cont'd)

Critical step: use appropriate M and R

	Overall		R < 100 km		R > 100 km	
	M	R	M	R	M	R
10 ⁻⁴ HF	7.0	260	5.6	22	7.7	360
10 ⁻⁴ LF	7.5	330	5.9	23	7.7	360
10 ⁻⁵ HF	6.0	90	5.6	14	7.7	360
10 ⁻⁵ LF	7.4	290	6.0	18	7.7	360
10 ⁻⁶ HF	5.8	31	5.7	12	8.1	320
10 ⁻⁶ LF	7.1	220	6.2	15	7.8	360

How to estimate site hazard

Method 1

Use broadbanded rock USH, multiply by mean $AF(f)$ to get broadbanded site UHS

Source: Risk Engineering, Inc. (2006)

Technical Presentation, 08/28/07, 39/51

Method 2

Use high-frequency (HF) and low-frequency (LF) rock spectra, multiply by mean $AF(f)$ calculated from HF and LF input, to get 2 site spectra, envelop.

2A: use 1 magnitude

2B: use multiple magnitudes

Source: Risk Engineering, Inc. (2006)

Technical Presentation, 08/28/07, 40/51

Method 3

Convolve rock hazard with site AF to get site hazard.

$$P[A_S > a] = \int P[A_R = x] P\left[AF > \frac{a}{x}\right] dx$$

Technical Presentation, 08/28/07, 41/51

Effect of $\sigma_{\ln(AF)}$ on site UHS amplitudes

$$a_{rp}^s = a_{rp} \overline{AF}_{rp} \exp\left[0.5K_H \sigma_{\delta}^2 / (1 - K_{AF})\right]$$

Technical Presentation, 08/28/07, 42/51

Method 4

Put site response in the seismic hazard software, calculate site hazard directly

Technical Presentation, 08/28/07, 43/51

Comparison of methods

Method:	Direct Site Calculation	Rock Calculation Amplified
Ground Motion Equation	Site-specific	Rock
Hazard Integral	Site-specific	Rock
Hazard Curve	Site-specific	Rock
Post-process	N/A	Amplify rock
Advantages	"Truth"	Traditional
Disadvantages	Changing site parameters → rerun everything	Approximate site effects (M, R effects approximated)
Approach	4	1, 2A, 2B, 3

Technical Presentation, 08/28/07, 44/51

Comparison of methods (cont'd)

Method:	Direct Site Calculation	Rock Calculation Amplified
Site Amplification	For all M and R	For critical M and R only
Epistemic uncertainties	Use multiple models	Use multiple models
Aleatory uncertainties	Handle with each M and R	Can treat accurately

Technical Presentation, 08/28/07, 45/51

“Results showed that once the (response spectral) value of a record at the bedrock is known, the additional knowledge of M and R , which implicitly define its average response spectrum shape, do not appreciably improve the estimate of $AF(f)$ at the same frequency f .

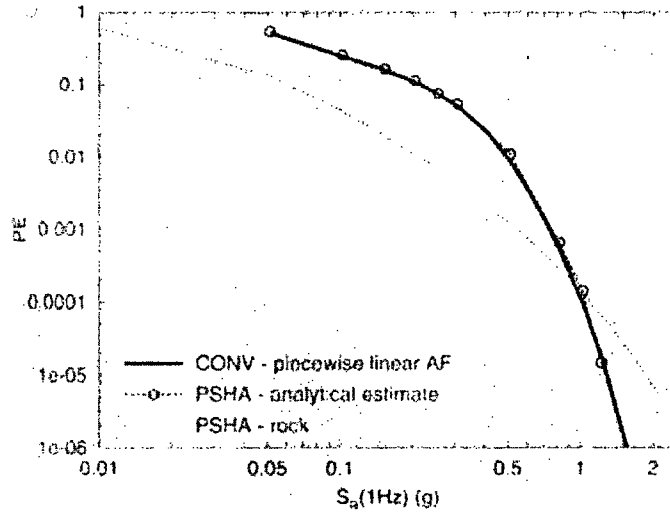

In other words, $AF(f)$, conditioned on (rock spectral level), is virtually independent of M and R .”

--Bazzurro and Cornell, 2004, BSSA
