

# PSHA, Site Response, and Site Spectra

Technical Presentation

Rockville, MD

August 28, 2007

## TOPIC 4: Site Spectra

Robin K. McGuire

Gabriel R. Toro

Risk Engineering, Inc.

Boulder, Colorado

Technical Presentation, 08/28/07, 1/54

## Topic 4: Site Spectra

- Performance-based spectra: concept and goal
- Review of performance-based results
- Converting horizontal spectra to vertical spectra

Technical Presentation, 08/28/07, 2/54

## Seismic Hazard and SSE Spectra

Based on ASCE 43-05:

Target performance goal of mean  $10^{-5}$  FOSID  
(Frequency of Onset of Significant Inelastic  
Deformation) to nuclear structures, systems  
and components

Technical Presentation, 08/28/07, 3/54

Distribution of mean annual seismic core damage frequency  
for 25 US nuclear plants

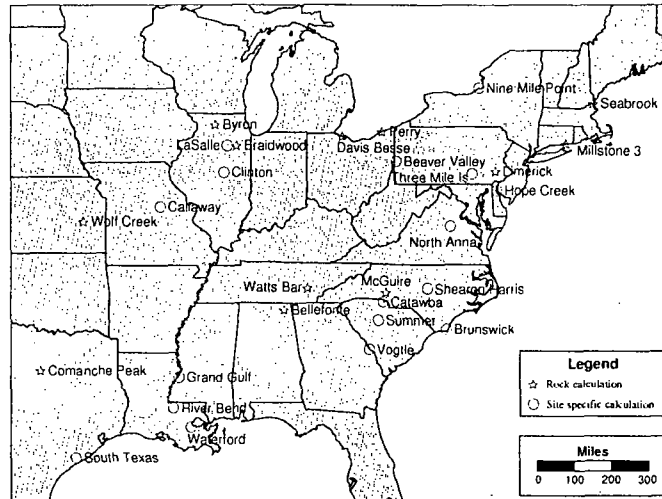

Cumulative  
distribution of  
SCDFs from 25  
seismic PRAs  
(NUREG-1742)

Source: REI 2005 EPRI Report

Technical Presentation, 08/28/07, 4/54

## 28 sites used for hazard comparison

Source: 2005 EPRI Report

Technical Presentation, 08/28/07, 5/54

## Calculations:

- Focus on 5 and 10 Hz spectral response (following reference probability approach in Reg. Guide 1.165)
- Develop recommended design response spectra following ASCE (2005):

$$DRS = DF \cdot UHRS$$

Technical Presentation, 08/28/07, 6/54

# ① Calculate ground motion ratio $A_R$

Technical Presentation, 08/28/07, 7/54

# Hazard curve slopes in US, 10 Hz

Source: NUREG/CR-6728

Technical Presentation, 08/28/07, 8/54

## Hazard curve slopes in US, 1 Hz

Source: NUREG/CR-6728

Technical Presentation, 08/28/07, 9/54

## ② Establish design basis earthquake response spectrum GMRS:

$$SA(10^{-4}) = \text{mean } 10^{-4} \text{ spectrum}$$

$$AR = SA(10^{-5}) / SA(10^{-4})$$

$$DF = \max(1.0, 0.6A_R^{0.8})$$

$$GMRS = \max[DF * SA(10^{-4}), 0.45 * SA(10^{-5})]$$

Technical Presentation, 08/28/07, 10/54

## Range of AR, DF, and P[exceedance] for 28 sites in study

	Min	16th	50th	84th	Max
10 Hz, AR	1.50	2.26	3.01	3.67	4.36
10 Hz, DF	1	1.15	1.45	1.70	1.95
10 Hz, PE/1E-4	0.37	0.40	0.48	0.68	1
5 Hz, AR	1.64	2.17	2.63	3.33	4.05
5 Hz, DF	1	1.11	1.30	1.57	1.84
5 Hz, PE/1E-4	0.38	0.43	0.54	0.75	1
2.5 Hz, AR	1.54	2.19	2.42	3.23	3.81
2.5 Hz, DF	1	1.13	1.22	1.53	1.75
2.5 Hz, PE/1E-4	0.4	0.45	0.62	0.76	1
1 Hz, AR	1.58	2.24	2.49	3.40	3.77
1 Hz, DF	1	1.14	1.24	1.60	1.74
1 Hz, PE/1E-4	0.39	0.44	0.61	0.73	1

Technical Presentation, 08/28/07, 11/54

### ③ Estimate plant resistance to:

A. Onset of significant inelastic deformation

B. Core damage

Technical Presentation, 08/28/07, 12/54

④ Derive P[occurrence] from P[exceedence]

Technical Presentation, 08/28/07, 13/54

⑤ Convolution

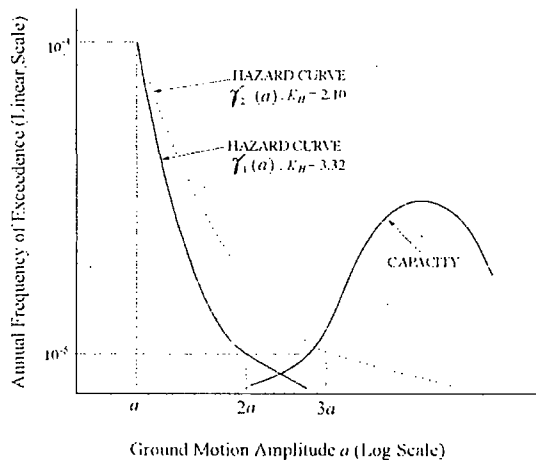

$$FOSID = \sum_{SA} f(SA) * P[OSID|SA]$$

$$SCDF = \sum_{SA} f(SA) * P[CD|SA]$$

Technical Presentation, 08/28/07, 14/54

## Hazard curves and capacity curve

Source: McGuire (2004)

Technical Presentation, 08/28/07, 15/54

## Risk equation (approximation to direct convolution)

$$P[\text{failure}] = \gamma(a^*) f_s^{-K_H} \exp[-x_p K_H \beta_C + 0.5(K_H \beta_C)^2]$$

where  $\gamma(a^*)$  is hazard at design value  $a^*$   
 $f_s$  is factor of safety on design (=1 for individual components)  
 $K_H$  is log-log slope of hazard curve  
 $\beta_C$  is  $\sigma_{\ln \text{CAPACITY}}$   
 $x_p = 2.326$  (for HCLPF of 1%)

Technical Presentation, 08/28/07, 16/54

## Calculations:

### Comparison 1:

Recommended design response spectra vs.  
SSE spectra used for existing plants:

- average of DRS/SSE at 5 and 10 Hz
- minimum DRS is RG 1.60 spectrum anchored to 0.1g (ASCE, 2005)

Technical Presentation, 08/28/07, 17/54

Source: 2006 EPRI Report

Technical Presentation, 08/28/07, 18/54

Source: 2006 EPRI Report

Technical Presentation, 08/28/07, 19/54

Technical Presentation, 08/28/07, 20/54

## Calculations:

### Comparison 2:

#### Component-level behavior:

- calculate Frequency of Onset of Significant Inelastic Deformation (FOSID), compare to distribution of Seismic Core Damage Frequency (SCDF) from 25 seismic PRAs

Technical Presentation, 08/28/07, 21/54

Distribution of mean annual seismic core damage frequency  
for 25 US nuclear plants

Cumulative  
distribution of  
SCDFs from 25  
seismic PRAs  
(NUREG-1742)

Technical Presentation, 08/28/07, 22/54

Source: REI 2005 EPRI Report

Technical Presentation, 08/28/07, 23/54

## Example of risk contributions

- “Typical” hard rock site
- 10 Hz spectral acceleration
- Look at Base Case (with original EPRI  $\sigma$ 's) and CAV case (with revised  $\sigma$ 's)
- Design SA:      for Base case = 0.358g  
                          for CAV case = 0.298g
- For  $\beta=0.4$ ,  $P[\text{failure}] \simeq 9.6 \times 10^{-6}$  (base & CAV)  
  For  $\beta=0.5$ ,  $P[\text{failure}] \simeq 7.2 \times 10^{-6}$  (base & CAV)

Technical Presentation, 08/28/07, 24/54

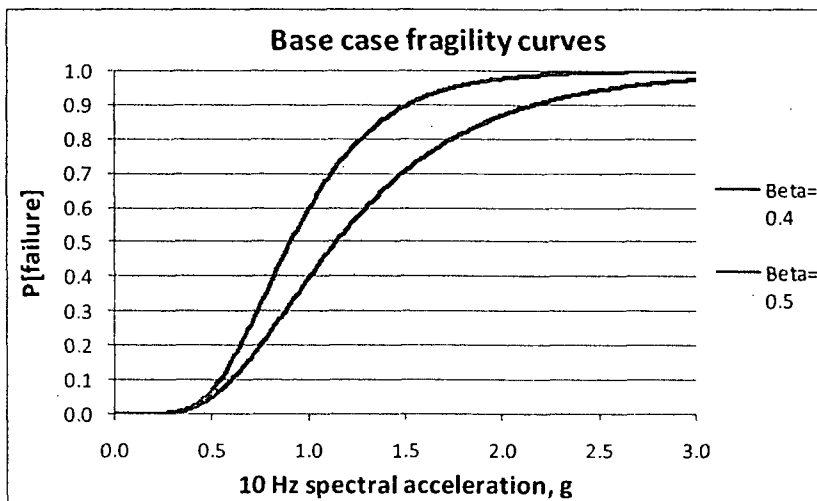

## Hazard curves, Base and CAV

Technical Presentation, 08/28/07, 25/54

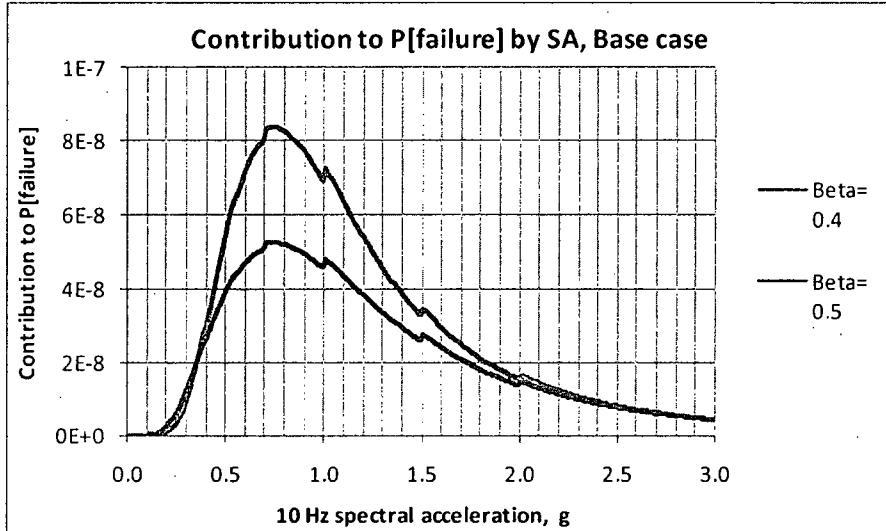

## Fragility curves for Base case

Technical Presentation, 08/28/07, 26/54

## Base case risk contribution by spectral amplitude

Technical Presentation, 08/28/07, 27/54

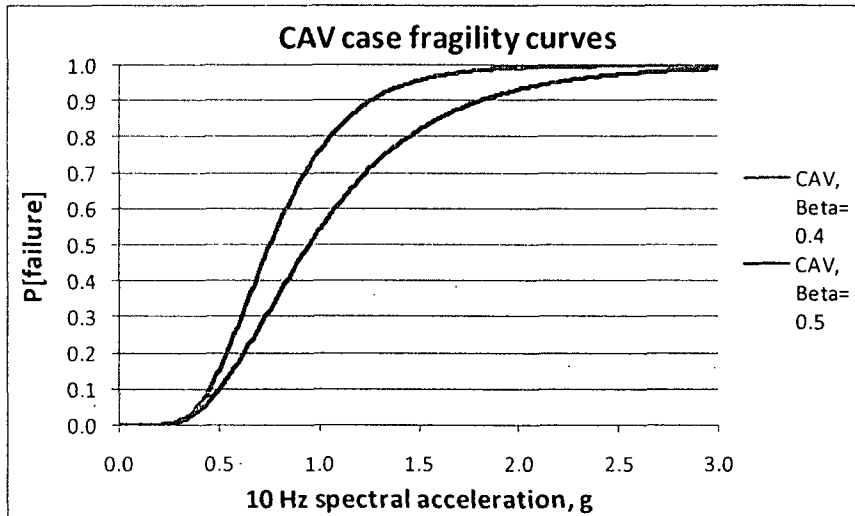

## CAV case risk contribution by spectral amplitude

Technical Presentation, 08/28/07, 28/54

## Fragility curves for CAV case

Technical Presentation, 08/28/07, 29/54

## Fragility curves for Base and CAV cases

Technical Presentation, 08/28/07, 30/54

## Risk contributions for Base and CAV cases

Technical Presentation, 08/28/07, 31/54

## Calculations:

### Comparison 3:

Plant-level behavior:

- calculate frequency of plant-level damage, compare to distribution of Seismic Core Damage Frequency (SCDF) from 25 seismic PRAs

Technical Presentation, 08/28/07, 32/54

## Conclusions:

- ASCE DRS method leads to recommended design response spectra at 5 and 10 Hz that, as a whole, are equivalent to those used at 28 existing NPPs
- ASCE DRS method leads to recommended design response spectra that achieve a performance goal of  $1 \times 10^{-5}$  per year, for individual components at 5 and 10 Hz
- ASCE DRS method leads to plant-level performance estimates that are safer against seismic initiated core damage than 80% of existing nuclear plants (based on 5 and 10 Hz)

- Soil sites may have reduced peaks at high frequencies

Source: Vogtle ESP (2006)

Technical Presentation, 08/28/07, 35/54

## Recommended SSE spectra

- Keep performance-based spectral amplitudes at 7 frequencies
- Smooth spectra in between based on spectral shape

Technical Presentation, 08/28/07, 36/54

## Vertical SSE Spectrum

- Multiply horizontal SSE spectrum by V/H to derive vertical SSE spectrum
- Precedents:
  - Grand Gulf (simplest)
  - Clinton
  - North Anna
  - Vogtle

Technical Presentation, 08/28/07, 37/54

## Grand Gulf

- Calculated horizontal SSE spectrum
- Used V/H ratio from RG 1.60  
(maximum = 1.0 at frequencies  $\geq 3.5$  Hz)

Technical Presentation, 08/28/07, 38/54

## Grand Gulf design spectra

GRAND GULF, 10-S ARE  
VERTICAL DESIGN SPECTRUM, PSA = 3.00E-6  
LEGEND  
----- HORIZONTAL SOIL DESIGN SPECTRUM, PSA = 0.001E-6  
----- VERTICAL SOIL DESIGN SPECTRUM, PSA = 3.00E-6

Source: Entergy Grand Gulf ESP Application (2003)

Technical Presentation, 08/28/07, 39/54

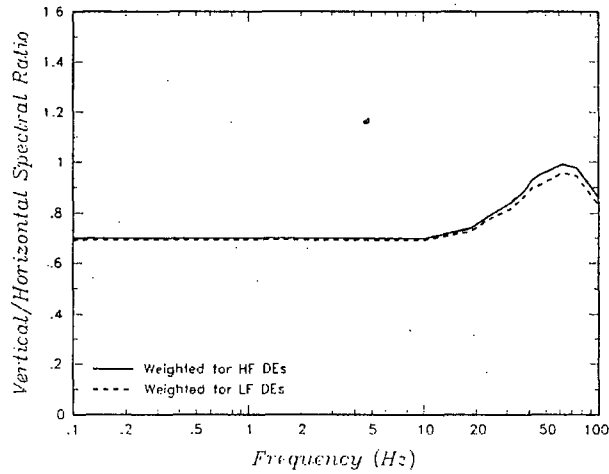

## Clinton

- Calculated horizontal SSE spectrum
- Derived V/H ratios in 4 steps
  - Rock CEUS V/H from NUREG/CR-6728
  - Soil WUS V/H from A&S (1997) and Campbell (1997) for  $M = 6.4$ ,  $R = 15$  km
  - Shifting peak response from  $\sim 15$  Hz to  $\sim 60$  Hz
  - Multiplying horizontal SSE by V/H ratio

Technical Presentation, 08/28/07, 40/54

## V/H ratios, CEUS rock, Clinton (from NUREG/CR-6728)

Source: Exelon Clinton ESP Application (2004)

Technical Presentation, 08/28/07, 41/54

## V/H ratios, WUS, Empirical (M=6.4, R=15 km)

Technical Presentation, 08/28/07, 42/54

## Recommended VH ratios for Clinton

Source: Exelon Clinton ESP Application (2004)

Technical Presentation, 08/28/07, 43/54

## North Anna

- Calculated horizontal SSE spectrum
- Used V/H from NUREG/CR-6728 (CEUS rock)
  - Applied V/H to get hard rock vertical SSE
  - Applied V/H to get soft rock vertical SSE
  - Checked soft rock calculation with RVT site response for vertical motions (P-SV waves)

Technical Presentation, 08/28/07, 44/54

## North Anna hard rock SSE spectra

Source: North Anna ESP (2004)

Technical Presentation, 08/28/07, 45/54

## Vogtle

- Calculated horizontal SSE spectrum
- Used  $V/H_{\text{Soil}}$  calculated by

→ 1<sup>st</sup> term: A&S (1997)

→ 2<sup>nd</sup> term: NUREG/CR-6728 Appendix J

Technical Presentation, 08/28/07, 46/54

## Recommended V/H for CEUS soil

RECOMMENDED V/H RATIOS FOR SOIL

Source: EPRI (1993)

Technical Presentation, 08/28/07, 52/54

## Options for Vertical SSE

1. (simple) Reg. Guide 1.60
2. Generic Soil Recommendations:  
Convert WUS soil V/H to CEUS soil V/H
  - A. Ad hoc (Clinton)
  - B. Numerical (Vogtle)Use published V/H ratios
  - C. Soft rock = hard rock (North Anna)
  - D. Average soil ratios (EPRI, 1993)
3. (site-specific soil) Calculate vertical amp. Factors with software (RASCAL-P). Use V/H (rock) to calculate vertical rock spectrum and amplify (Approach 2A or other (?))

Technical Presentation, 08/28/07, 53/54

## Summary

- Performance-based method of selecting GMRS achieves a FOSID of  $\leq 1 \times 10^{-5}$  per year
- For soil sites,  $10^{-4}$  and  $10^{-5}$  site spectra should be calculated and GMRS determined from those
- Final spectra should be anchored to calculated GMRS at 7 frequencies and smoothed at other frequencies
- Several methods of calculating vertical spectra are available and justifiable

Technical Presentation, 08/28/07, 54/54
