Indian Point Energy Center Status Report

August 30, 2007

Operational Status

- Indian Point Unit 2 is operating at 100 percent power and has been online for 92 days. Unit 3 is operating at 100 percent reactor power and has been on line for 120 days.

Update on Groundwater Investigation

- Investigators have installed a packer device on the riverfront monitoring well MW-67, located near the Unit 2 turbine building. The well is being flushed and will be sampled tomorrow. This is the last well installed as part of the investigation
- Samples results from MW 39, MW 46, MW 54, MW 58 and MW 59 have all come back with results comparable to previous samples.
- MW-66, located near MW 67 on the waterfront, has preliminary results for Sr-90 of 6 pCi/L and tritium of 9000 pCi/L, which are consistent with the hydro-geologic model for water flow on the site.
- Fish specimen samples taken from the Hudson River are being analyzed. The test results should be back in late September. The samples were split among Entergy, DEC and NRC
- The IP2 non-destructive testing of the transfer canal has not revealed any through wall leaks in the pool liner. The inspection is expected to continue for another 4-6 weeks. The transfer canal is a high contamination area and classified as a confined space which makes for a difficult work area for inspectors. About 16% of the canal has been completed.

Indian Point Completes Special Nuclear Material Inspection

The just completed Special Nuclear Material inspection at IP3 showed that all items have been inventoried and are stored where they should be stored. Special Nuclear Material was defined by the Atomic Energy Act of 1954 to include isotopes of uranium and plutonium some of which can undergo a fission reaction.

The majority of SNM is contained in the spent fuel elements located in the spent fuel pool. At IP3, small amounts are also stored in a 12-foot canister holding three smaller containers inserted

Container above shows pieces of in-core detectors. The picture was taken at the bottom of the spent fuel pool approximately 40-feet from the top.

into a fuel rack. Previous to this year's inspection, the containers were not opened and inventoried.

Inventory records indicated that one of the containers held pieces of 32 in-core detectors, which contain very minute quantities of U-235, a special nuclear material.

The in-core detector assemblies were cut up in the late 1980's so that they could be stored in the canister. During the recent inspection, fuel handlers used specially designed long-handled tools and remote video to open the canisters and conduct a piece-by-piece inspection. Each item in the canister, which included metal tubes housing the detectors and associated wiring, was visually inspected, measured and surveyed for radiation levels.

Based on these inspections, the linear footage of tube material measured, comparisons to design specification and inventory records, and coupled with confirmatory radiological evaluations, Entergy concluded that all 32 detectors were present in the canister as expected.

The NRC followed the inspection in the field very closely and will review the documentation of the inspection results.

Educational Outreach

Entergy Nuclear provides customized outreach education programs for schools, youth groups, and civic organizations. The topics we cover include Emergency Planning, Understanding Radiation, Nuclear Fuel and a general overview of the operations of Indian Point Energy Center. If you would like a brochure or are interested in scheduling a program, contact IPEC Communications at 914-271-7441.

If you have any questions or need clarification of the information provided, please contact Kathy McMullin, manager of communications, Indian Point Energy Center, at 914-271-7132.
