DOCKET NO. 40-7344

Mr. R. Woosley
United States Atomic Energy Commission
Division of Material Licensing
Room 514
Washington, D. C. 20540

Dear Mr. Woosley:

Enclosed is a list of all General Electric Company Missile and Space Division buildings in the Philadelphia area. All work with radioactive material in these buildings is reviewed by either the Space Systems or Re-entry Systems Ionizing Radiation Advisory Group. All work with uranium is reviewed by the Re-entry Systems IRAG.

Administering the radiation safety program for both IRAG groups, including work with uranium, is the responsibility of the Health Physicist, R. O. McClintock, therefore, the radiation safety for all buildings is under the control of the Health Physicist.

Our alpha air monitoring equipment consists of two Eberline AIM-3 continuous air monitors, two Staplex air samplers and several lapel air monitors. However, this equipment is not used routinely to monitor our present uranium work. The Health Physics instructions for this work specifies that all work that could involve airbourne contamination must be performed in a hood. Routine contamination surveys and job safety evaluations by the Health Physicist verify that this precaution is sufficient to control contamination and that air monitoring equipment is not required. Any changes in the scope of the job would, of course, result in a new safety evaluation. If you have any questions, please feel free to call.
