To Paul R. Nelson Sr Radiation Specialist COT,  
From Eugene Epstein Radiation Specialist COT.

Subject Item to file. Evaluation Re  
General Electric Valley Forge Pa Lic 37-02006-05.

Licenses activities are minimal  
with excellent facilities. ~~strict~~ <sup>strict</sup> health  
physics supervision is provided. Licensee  
personnel are all safety ~~unconscious~~ conscious  
and no hazard is believed to exist.

The license is properly categorized as E(1)  
with priority II and will be scheduled  
for inspection during 2/71.

Information in this record was deleted  
in accordance with the Freedom of Information  
Act, exemptions 6  
FOIA- 2007-304

Mr. Walter Trasini - Manager Relations and  
ass't to the General Manager Daniel Fink.  
Robert O McClintock - R.S.O.

Report Details

Background Information

Last previous inspection was performed  
5/2/68 by R. Fish. One item of non-compliance  
was noted. Failure to leak test small alpha  
sealed sources at intervals less than 3 months  
as required by condition 14(C) of the license.

Records indicate and McClintock stated that  
alpha emitting sources are test now tested for  
leakage at intervals which do not exceed  
three months.

### Organization and Administration:

Mc Clestock, the R.S.O. stated that up to two weeks ago he had an associate technician and a secretary, but due to a ~~big~~ layoff of 2500 persons he lost both. The plant which formerly had 6000 employees is now down to 3500. All organization however is as reported in license back-ups. He stated that only 20 persons are involved in minor uses of materials.

### Facilities and Use of Materials:

Mc Clestock stated that areas where radionuclides are used or stored are as follows:

(1) Concrete shielded subbasement storage area used by Health Physics to store cans and sources not in immediate use.

\* On hand in the storage area was  
36 mc Co<sup>60</sup> sealed  
10 C Sr<sup>90</sup> sealed  
5 C H<sup>3</sup> sealed light sources  
1 mci mixed fission products  
1.5 mci Co<sup>60</sup> (pol.)

(2) W Shallow Groups.

use of only generally licensed standards less than 1 mci each.

(3) Main Sewer Groups.

use of 3 Am<sup>241</sup> sealed light sources inside sealed apparatus less than 200 c.f.u. <sup>mc</sup>

(4) Koepp-Baber groups.

7 Ci - H<sup>3</sup> sealed light source

4 Ci - H<sup>3</sup> sealed light source

In a fixed sealed apparatus with no handling by personnel.

(5) Biology group.

use of 200 uci Cr<sup>51</sup> and 50 uci I<sup>125</sup> to tag blood cells in vitro for experimental studies which will allow astronauts on a Manned Orbital Station to check their own blood to determine blood volume and cell survival time. Three taggings per week.

The above according to records maintained by the Ministry are the only programs in effect during the last two years.

Facilities for the above are all modern laboratories. The only group requiring some precautions is the Biology group. The laboratory is equipped with HEPA-filtered exhaust hoods with face velocity in excess of 100 lfm. Mr. J. Geating in charge of the group stated that remote syringes and pipettes are used and that all doses are made up in the exhaust hood. Plastic gloves are used but coats are worn when working with materials.

### Personnel Monitoring:

Sandauer Biomax film badges are used for some 20 persons who may be involved with radio-nuclides. Records are maintained on processes reports as well as Form 107-5. Records examined for the past two years indicate that maximum exposure to the whole body occurred in the Biology Group with (b)(6) receiving 100 mrem for the 1<sup>st</sup> calendar quarter 1960. All other exposures are reported as minimal, less than 10 mrem. Exp

### Survey:

Area surveys are made in all areas of use and storage monthly. The records indicate that only the Biology Laboratory has detectable contamination no more than 20 dpm/m<sup>2</sup> on any surface.

Direct physical surveys are made monthly and levels of 10 mrem were noted inside the Storage Room. All other areas had radiation levels less than 1 mrem/hr.

### Waste Disposal

All liquid waste is collected in metal drums to be solidified. Only one liter of liquid waste has been generated to date and not disposed.

Solid waste is gathered by Health Physics and transferred to Radiological Services

Records are maintained showing kind quantity and date of disposal.

### Posting and Labeling.

All areas of use and storage were posted with signs reading "Caution Radioactive Materials" w symbol. The storage area was also posted with a sign reading "Positive Radiation Areas" w symbol. All containers and apparatus using materials had labels affixed reading "Caution Radioactive Materials" w symbol and indicating kind quantity and date of assay of contained material.

### Independent Survey

Radiation level at the surface ~~of~~<sup>Indeterminate housing</sup> ~~of~~<sup>of</sup> ~~Gamma~~<sup>Gamma</sup> source was 20 mrem. Radiation level outside the storage room did not exceed 0.3 mrem at any surface.

### License Conditions

10. Place of use at King of Prussia location no use reported at Capt Kennedy Rd or at Chestnut St, Phil.

12. Records were examined indicating all wastes have been approved by the Longview Radiation Advisory Group.

13. All beta-gamma sealed source and not tested for leakage at intervals which did not exceed six months. All alpha emitting

source was tested at intervals which did not exceed 3 months. Tests were made by impregnating accessible surfaces with ~~petroleum~~ filter paper and counting in a scintillation well counter or a pulse height analyzer using appropriate standards. No leakage exceeded 0.002 curi.

Cont #14 - Materials have not been used in launched missiles, spacecraft or payloads according to the Client's code

Cont #15. Materials have been used according to the license and procedures outlined in an application dated 9/3/68.

#### Management Review

Mr. Walter Trosin Manager Reliability and Assistant Plant Manager was advised of the status of the inspection and assured them it is 5% done.
