Subject: Fwd: Review of EPR Topical Report - BNL's Comments

Ronda,
Attached please find BNL's comments on your responses to the Piping TR RAIs.
Please let's know when we can have a conference call to discuss these
comments. Next week will not be good for BNL.
Thanks,
Getachew Tesfaye

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
Piping and Pipe Support Design - General	<p>RAI EPR-1: Section 1.0 of the Topical Report (TR) states that the reactor coolant loop (RCL) and pressurizer surge line piping requirements, modeling techniques, analysis approaches and acceptance criteria are not specifically addressed in this document and will be included in the design control document (DCD). The TR presents nearly all of the design certification requirements, acceptance criteria, analysis methods and modeling techniques for the American Society for Engineers (ASME) Class 1, 2 and 3 piping and pipe supports, as required in the Standard Review Plan (SRP) Section 3.12 for new reactors. Describe any significant differences between the requirements, techniques, approaches and design criteria for the RCL and pressurizer surge line piping, and those included in the TR.</p>	<p>Reactor Coolant System large bore piping requirements, modeling techniques, analysis approaches and acceptance criteria are not specifically addressed in the TR because of the major differences in mathematical modeling and model loading approaches and techniques that exist between the RCL structural analysis and Class 1 piping analysis. The RCL loop structural model includes representation of the nuclear island basemat and the Interior Concrete Structure (ICS), to which the RCL supports are attached, as well as very detailed representations of the primary components and their internals. In addition, in most cases, the RCL supports are explicitly represented in the model. Class 1 piping models do not include representations of the supporting concrete structures or detailed representations of components, and the supports are not typically explicitly modeled. The method of seismic loading is also quite different, with the RCL loop structural model being loaded through application of</p>	<p>Acceptable.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
		<p>basemat excitation to the base of the ICS, whereas Class 1 piping models are loaded through the application of attachment point response spectra (or time histories), floor response spectra (or time histories) and seismic anchor motions at the various support locations in the model. Other aspects of RCL structural analysis are the same as those described for Class 1 piping in this TR, aspects such as damping requirements, load combinations, mass distribution requirements, cut-off frequency requirements, and applicable ASME stress and fatigue allowables. A thorough description of the approaches and methods employed in the structural, stress and fatigue analysis of the RCL piping will be included in Chapter 3 of the U.S. EPR Design Control Document.</p>	
<p>ASME B31.1 and Section XI Codes</p>	<p>RAI EPR-2: A. In accordance with RG 1.26, Quality Group (QG) D piping that may contain radioactive material is considered to be outside the ASME Code Class 1, 2, and 3</p>	<p>A. The U.S. EPR piping systems containing radioactive material (outside the Reactor Coolant Pressure Boundary) are classified as Quality Group D and are designed to ASME B31.1, 2004.</p>	<p>A. Acceptable. AREVA needs to change the TR Section with the proposed text.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
	<p>piping systems. The Regulatory Guide (RG) recommends that these piping and pipe supports are to be designed in accordance with the requirements of the ASME B31.1, "Power Piping" Code. Please clarify if the Evolutionary Power Reactor (EPR) piping and pipe supports will have QG D systems; and confirm that whether EPR piping design will use the ASME B31.1 Code for these systems, otherwise provide technical justification for using other than the B31.1 Code requirements for the QG D piping systems.</p> <p>B. Confirm that ASME Code Section XI requirements will be used in the piping and pipe support design for EPR.</p>	<p>Section 1.0 and 2.1 of the TR will be revised to include the following text:</p> <p>"Quality Group D piping will be analyzed to ASME B31.1, 2004 Edition, no addenda."</p> <p>B. The U.S. EPR adheres to the requirements of the ASME XI, 2004 Edition, no addenda. No Section XI code cases are used for the U.S. EPR.</p>	<p>B. Not Acceptable 10 CFR 50.55a has not yet endorsed 2004 Edition. Justify using this edition of the ASME Code.</p>
 10CFR50.55a(b) Limitations and	RAI EPR-3: Section 2.1 of the TR states that for the dynamic loads, including seismic loads,	The limitations of 10CFR50.55a(b)(1) are considered in the U.S. EPR design as follows:	<p>Not Acceptable. Explain why the limitations in items (v) and (vi) are not</p> 

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION

		<p>represented as: $F_1 = kmS_a$ Where: k = 1.0 for single degree of freedom or rigid system k=1.5 for multiple degree of freedom system m = mass in direction 1 Sa = value of acceleration from response spectrum</p> <p>The forces from each of the three orthogonal directions of earthquake are applied to calculate seismic stresses and then combined by SRSS to calculate overall seismic stresses."</p>	
Piping Analysis Criteria	<p>RAI EPR-6: A. SRP Section 3.9.2, Item II.2.A(i)(3) requires an investigation for a sufficient number of modes to be included in the piping modeling to ensure that all significant modes have participated in the analysis. Provide the criterion that would ensure this requirement.</p>	<p>A. The criterion for the inclusion of sufficient number of modes stated in SRP 3.9.2 II A(i)(3) is that the "inclusion of additional modes does not result in more than a 10-percent increase in responses." All modes with frequencies below the ZPA frequency are included in the piping analysis. Above this frequency, in the rigid range, the effects of all additional modes are included by the application of the missing mass</p>	<p>A. Acceptable.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
	<p>B. The cutoff frequency for modal responses is defined as the frequency at which the spectral acceleration approximately returns to the zero period acceleration (ZPA) of the input response spectrum. Define this cutoff frequency qualitatively or quantitatively for seismic and other building dynamic loads (if any) applicable to the piping analysis for the EPR.</p>	<p>correction as discussed in TR Sections 4.2.2.3.2 and 4.2.3.</p> <p>B. The cutoff frequency for a given spectra is the frequency at which the response curves for all damping values converge to the same acceleration value (ZPA) and remain at this value for all frequencies above this cutoff frequency. Section 4.2.2.3 will be revised to add, "For the U.S. EPR the cutoff frequency is 50 hertz or as defined by figure 2 and 3 in RG 1.92, Rev 2."</p>	<p>B. Not Acceptable. Either provide technical justification for the selection of 50 Hz as the cutoff frequency or commit to the criteria as defined in Figure 2 and 3 in RG 1.92, Rev 2. Also, note that the resolution of this also applies to the text proposed for RAI EPR-9.</p>
Branch Pipe Inputs	<p>RAI EPR-7: When a small seismic Category I or non-seismic Category I piping is directly attached to seismic Category I piping, it can be decoupled from seismic Category I piping if it satisfies the decoupling criteria. However, the TR did not describe how the inputs for the small branch piping will be determined for both inertial and seismic anchor motion (SAM) response analyses</p>	<p>The model of a decoupled Class 1 branch line includes an anchor where the branch line connects to the RCL. The seismic inertial analysis of the RCL yields time histories at branch connections and equipment nozzles. The inertial seismic analysis results then become input into the Class 1 branch line seismic analysis in the form of time histories or response spectra which are generated from the time histories using classical response spectra generation techniques. If</p>	<p>Not Acceptable. Note the following: (a) The reference to RG 1.60 R1 for the $\pm 15\%$ spectra broadening should be RG 1.122 R1. (b) For the remaining decoupled branch lines not connected to the RCL, the amplification of the RS and SAM at the small pipe connection locations should be used in the analysis, as in the case of the RCL. The method presented in the response is not in</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
	<p>when the piping system is decoupled from a large pipe run or connected to flexible equipment connections. The staff notes that computer code RESPECT (TR Section 5.1.8) generates seismic amplified response spectra at the branch nozzle locations in a model of a piping system. Describe the seismic analysis methods and procedures, including the input response spectra and input SAM displacements, that apply to the small branch piping design when decoupled from a large run pipe or connected to flexible equipment. The description should also discuss how any amplification effects and SAM effects, from the main run pipe at the attachment to the small branch pipe, are considered.</p>	<p>response spectra are used, they are peak broadened by $\pm 15\%$ in accordance with RG 1.60 R1 before application to the Class 1 branch line model. The analysis of the Class 1 branch line also considers seismic movements generated from the RCL (seismic anchor motions), which are applied as static displacements at the branch-to-RCL anchor. This analysis captures the effects of run pipe amplification on the branch pipe.</p> <p>For the remaining decoupled branch lines (not connected to the RCL), the model of a decoupled branch line includes an anchor at the run to branch intersection. The analysis of the branch line includes all anchor movements greater than 1/16" from the run pipe applied at the run to branch anchor for all load cases. The inertial seismic input for the branch line comes from the appropriately applied building and/or flexible equipment spectra based on support configurations and the inertial movements from the run pipe. The decoupling criterion stated in the TR</p>	<p>agreement with this approach, and therefore, the technical basis for the treatment of the inertial effects of the main run (large diameter piping) needs to be provided. The technical basis shall also explain what input spectra will be used at the branch-to-run pipe anchor in the method when performing the dynamic analysis of the branch line. Note that the envelope of building excitations for the nearest supports on the branch pipes alone may be acceptable only on case-by-case basis, when it can be demonstrated that there is no significant amplification caused by the main run piping at the branch pipe anchor connection.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
		<p>assures that the run pipe is rigid compared to the branch pipe and no amplification effects are considered.</p> <p>The last paragraph of Section 5.4.2 will be changed to the following:</p> <p>“The branch pipe analysis must include more consideration for the effects of the run piping. The branch point is considered as an anchor in the analysis of the branch pipe with the same SIF and/or stress indices as the run pipe at this point. The movements (displacements and rotations) of the run pipe at the branch intersection due to statically applied loads in the run pipe analysis (such as thermal and seismic anchor movement (SAM)) shall be applied as anchor movements with their respective load cases in the branch line analysis. The inertial effects of the run pipe on the branch line are considered in one of the following methods:</p> <ul style="list-style-type: none"> • For branch lines decoupled from the RCL, the inertial input to the branch line is generated from the analysis of the RCL. The analysis of the RCL yields

AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
Equivalent Static Load Analysis	RAI EPR-12: Confirm that the equivalent static load is always determined by multiplying 1.5 to the peak acceleration for all cases including a single degree of freedom system with known fundamental frequency or a rigid system with the fundamental frequency beyond the cutoff frequency. If not, then provide the criterion that will be used for these special cases.	For clarity, Section 4.2.4 will be revised to include the following text: "For multiple degree of freedom systems, the peak acceleration of the appropriate floor response spectra will be multiplied by 1.5. For cases where piping configurations are calculated as single-degree of freedom systems with known fundamental frequencies or rigid systems with fundamental frequencies beyond the cutoff frequency (ZPA), a factor of 1.0 may be used with the spectral accelerations at that frequency."	Not Acceptable. The staff assessment for the equivalent static load method is presented under RAI EPR-5.
Small Bore Piping	RAI EPR-13: The TR did neither define nor address the design of small bore piping to be used in the EPR piping design. Define the small bore piping to be used in the EPR piping design and discuss, with technical bases, the methods of analysis (handbook or a system flexibility analysis) that will be used in the small bore piping design for ASME Class 1, 2, 3 and QG D piping.	Section 4.5 of the TR will be added to include the following text: "Small bore piping for the U.S. EPR is defined as ASME Class 1 piping that is 1" NPS and smaller and Class 2, 3 and QG D that is 2" NPS and smaller. This piping may be analyzed using response spectrum methods described in 4.2.2 of the Topical Report, the equivalent static method described in 4.2.3 or by handbook method."	Not Acceptable. For the case of the handbook method to be developed by the COL applicant, either include the criteria for the approach in the TR or this should be noted in the TR as a COL action item in TR Table 1-1. In addition, confirm that the criteria provided for the small bore piping also is intended to cover instrumentation lines. Include this in the TR.

RAI Topic	RAI Description	AREVA Response	BNL Disposition
		If the COL applicant elects to use the handbook method, the COL applicant will develop the handbook.	
Non-Seismic/Seismic Interaction	RAI EPR-14: A. TR Section 4.4.1 states that non-seismic piping which cannot be completely separated from seismic systems is routed as far away as possible. With examples, please discuss under what conditions this type of isolation is used in the EPR piping design and also, quantify the meaning of "as far away as possible."	<p>A. Section 4.4.1 states "Non-seismic piping which cannot be completely separated from seismic systems is routed as far away as possible." The sentence in the TR stems from standard seismic "II over I" layout guidance, which would, for example, have two piping systems in the same room (one seismic and one non-seismic) be physically located away from each other as much as possible, such that there will be little chance of the non-seismic piping adversely interacting with the seismic piping, potentially causing damage to the seismic piping during a seismic event.</p> <p>In addition to the physical separation distance used in common areas, the layouts utilize physical barriers within the area, such as large equipment items which can provide obvious protection for the seismic system from the potential effects of the damaged</p>	A. Acceptable. AREVA needs to change the TR Section with the proposed text.

	valve operation; this can greatly affect the transient loads imposed on the piping system analysis. Also, any change in the discharge piping system configuration may affect the SRV loadings.		
Composite Damping	RAI EPR-32: The composite modal damping ratio can be used when the modal superposition method of analysis (either time history or response spectrum) is used, as described in SRP Section 3.7.2, II.13. If AREVA plans to use composite modal damping for U.S. EPR piping design, provide a description of the methods for determining the composite modal damping value.	Composite modal damping may be applied when the modal superposition method of analysis is used. The methods used will meet the requirements of SRP 3.7.2. Section 4.2.5 of the TR will be revised as follows: "When composite modal damping is applied in a dynamic analysis, each model subgroup (piping, supports, equipment, etc) is assigned an appropriate damping value per RG 1.61 R1. The equivalent modal damping matrix, or composite modal damping matrix, is calculated for each mode by one of the two methods shown below: EQUATIONS, SEE RESPONSE. Note: Damping beyond 20 percent will	Acceptable. AREVA needs to change the TR Section with the proposed text.

RAI Topic	RAI Description	AREVA Response	BNL Disposition
		not be used."	
Codes for Support Design	<p>RAI EPR-33: A. TR Section 6.1 states that for Service Levels A, B and C, the seismic Category I pipe supports will be designed in accordance with Subsection NF of the ASME Code and for Service Level D, Appendix F of Section III of the ASME Code will be utilized. However, TR Section 6.2 states that all piping supports designed in accordance with the rules of Subsection NF of the Code up to the building structure interface are defined by the jurisdictional boundaries in Subsection NF-1130 of the ASME Codes. (i) Since Appendix F of the Section III provides only the Service Level D limits for evaluation of loading [per Code Table NF-3523(b)-1 for stress limit factors] for Class 1, 2, 3 and MC type supports, clarify if the seismic Category I pipe supports will be designed to ASME Subsection NF for all four</p>	<p>A. (i) TR Section 6.1 will be corrected to indicate that Seismic Category I pipe supports will be designed to ASME Subsection NF loadings for Service Levels A, B, C and D, while using the acceptance limits of Subsection NF for Levels A, B and C, and the acceptance limits of Appendix F for Level D. (ii) Subsection NF of the ASME Code will be used for the manufacturing, installation and testing of all Seismic Category I pipe supports.</p>	<p>A. Acceptable. AREVA needs to revise the TR Section.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
	<p>Service Level A, B, C and D loads, while using the acceptance stress limits by the Appendix F for Service Level D supports. (ii) Also, clarify if the Subsection NF will be used to manufacture, install and test all seismic Category I pipe supports. If not, which other standard will be used.</p> <p>B. AREVA also states that seismic Category II pipe supports are designed to ANSI/AISC N690, "Specification for the Design, Fabrication and Erection of Steel Safety-Related Structures for Nuclear Facilities." These standards are used to design the structures or structural elements of a support for nuclear facilities, not the standard component supports (e.g., clamps, snubbers). ASME Code Subsection NF is typically used for seismic Category II pipe supports. Identify the standard that will be used to design,</p>	<p>B. For all Seismic Category II pipe supports other than standard component supports, the design, manufacturing, installation and testing will meet the requirements of ANSI/AISC N690. Standard component supports will be designed, manufactured, installed and tested to Subsection NF of the ASME Code. Any structural members used as part of a pipe support also containing standard components will be designed, manufactured, installed and tested to ANSI/AISC N690.</p>	<p>B. Not Acceptable. AREVA needs to revise the TR Section. The use of ANSI/AISC N690 should include Supplement 2 (2004) of the specification N690, in accordance with SRP Sections 3.8.3 and 3.8.4, March 2007.</p>

AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
	<p>manufacture, install and test seismic Category II pipe supports.</p> <p>C. AREVA states that non-seismic category pipe supports are designed using guidance from the AISC Manual of Steel Construction. This manual is used to design steel constructions in frame type or other structural element of component supports. Based on TR Section 6.2, ASME Code B31.1 is being used for a certain class of piping (also see request for additional information (RAI) EPR-2). The design of all supports for the non-nuclear piping (that typically uses B31.1 for piping analysis) should satisfy the requirements of ASME/ANSI B31.1 Power Piping Code, Paragraph 120 for loads on pipe supporting elements and Paragraph 121 for design of pipe supporting elements. Clarify if this is applicable to U.S. EPR</p>	<p>C. For non-seismic pipe supports supporting piping analyzed to B31.1, the requirements of B31.1 for supports (Sections 120 and 121) will be met, where applicable. In addition, the structural elements will meet the requirements of the AISC Manual. For standard components used in such supports, vendor's catalog requirements will be utilized, which also meet B31.1 requirements. For non-seismic pipe supports supporting unanalyzed piping, the structural elements will meet the requirements of the AISC Manual and standard components will meet vendor's catalog requirements.</p>	<p>C. Acceptable. AREVA needs to revise the TR Section.</p>

	pipe support design, otherwise explain how the AISC manual will be used to design component supports (e.g., clamps, springs).		
Load Combination for Supports	<p>RAI EPR-34: While reviewing TR Section 6.3, the staff needs clarification of the following items.</p> <p>A. TR Section 6.3.11 provided a minimum design load criteria that will be used for all supports so that uniformity is obtained in the load carrying capability of the supports. All supports will be designed for the largest of the following three loads: 100% of the Level A condition load, the weight of a standard ASME B31.1 span of water filled, schedule 80 pipe, and minimum value of 150 pounds. Provide the technical basis for this criteria.</p> <p>B. TR Table 6-1 provides the specific load combinations that</p>	<p>A. The Minimum Design Load criteria given in this section is based on criteria given in Welding Research Council (WRC) Bulletin 353, Section 2.4.7. The bulletin recommends 125% of the Level A condition load, as the only difference from the topical's criteria. Presently, for the analyses being performed as part of the Design Certification process, the guidance is to apply a 25 percent increase to all pipe support loads to allow for possible future increases in support loads beyond the initial design.</p> <p>B. Table 6-1 includes three Faulted load</p>	<p>A. Not Acceptable. If the current approach stated in the response is to apply a 25% increase to all pipe support loads for possible future increases, and this approach is also recommended in the WRC Bulletin 353, then the TR should state this.</p> <p>B. Not Acceptable.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
	<p>will be used in the design of pipe supports. The acceptance criteria associated with the Service Levels will be per ASME Code, Subsection NF, ANSI/AISC N690 or the AISC Manual of Steel Construction, as appropriate. Note 1 to the Table states that operating basis earthquake (OBE) inertia and SAM loads are not included in the design of Class 2/3 piping. Explain how the seismic inertia and SAM loads are accounted for in the design of Class 2/3 pipe supports. Also, clarify how the same table is applicable to snubbers, struts, and anchors/guides.</p> <p>C. AREVA discusses wind/tornado loads in TR Sections 6.3.5 and 6.3.6 for pipe supports. However, for the piping in TR Section 3.3.1.6, AREVA identified these loads to be COL Action Item 3. Clarify AREVA's position on this.</p>	<p>combinations which contain SSE loads. In addition, Note 3 of the table states that SSE includes inertia and SAM loads combined by absolute sum. These would all apply to Class 1, 2 & 3 pipe supports. In addition, struts and anchors/guides will be analyzed to all load combinations shown in the table. Snubbers will be designed to all but the Normal Level load combinations shown in the table.</p> <p>Note that Class 1 was inadvertently not included in Note 1 of Table 6-1. This will be corrected in the next revision of the TR. Note 1 will be revised to state, "OBE inertia and SAM loads are not included in the design of Class 1, 2 & 3 piping."</p> <p>C. Section 3.3.1.6 states that for Design Certification, no Class 1, 2 and 3 piping is exposed to wind and tornado loads, and further states that if a COL Applicant creates such an exposed piping condition, it will be addressed at that time. Sections 6.3.5 and 6.3.6</p>	<p>AREVA needs to revise the TR Section. Define all terms used in the Table 6-1 and include the definitions in Table 6-1 or cross reference where they are already defined. It is acceptable to design snubbers to all load combinations except normal level load combinations. However, for the load combinations where wind and tornado occur, will the piping and all supports be designed for the following two conditions: snubbers included and snubbers excluded? If not, explain why not.</p> <p>C. Not Acceptable. (1) Explain why the friction load F is not included in the load combinations that contain wind or tornado since these two loads may not always act as dynamic type loadings. (2) For piping</p>

RAI Topic	RAI Description	AREVA Response	BNL Disposition
		<p>discuss the inclusion of such wind related loads for pipe supports. AREVA's position on wind loadings for both piping and supports is as stated in Section 3.3.1.6. Clarification will be added to Sections 6.3.5 and 6.3.6 to cross reference this section, and state that these sections show how such loads would be treated if the need arises.</p>	<p>design and pipe support design why isn't R_{SOT} considered in other load combinations (i.e., in combination with R_{DBPB}, $R_{MS/FWPB}$, LOCA, $R_{DBPB}+SSE$, $R_{MS/FWPB}+SSE$, and LOCA+SSE)?</p>
Snubber Design	<p>RAI EPR-35: AREVA, in TR Section 6.6, states that design specifications are to be provided to the snubber suppliers and the installation and operation of snubbers will be verified by the COL applicant. For design certification, SRP Section 3.9.3 requires that design, installation, operation and testing of the snubbers should be included in the design document. Clarify, whether AREVA intends to include all design-related specifications associated with snubbers in the TR or in the DCD.</p>	<p>As stated in item 2 of Table 1-1 of the TR, design specifications will be the responsibility of the COL applicant. The specification will be generated using the snubber specification requirements given in Chapter 3 of the DCD.</p>	<p>Acceptable.</p>

REQUESTS FOR ADDITIONAL INFORMATION (RAI) RESPONSE EVALUATION
AREVA Topical Report ANP-10264NP (Rev. 0) for U.S. EPR Piping Analysis and Pipe Support Design

RAI Topic	RAI Description	AREVA Response	BNL Disposition
Support Stiffness	<p>RAI EPR-36: AREVA does not adequately describe in TR Section 6.7 how the representative stiffness values are developed for all supports other than snubbers. Describe:</p> <p>1. the approach used to develop the representative stiffness values, 2. the procedure that will be imposed to ensure that the final designed supports match the stiffness values assumed in the piping analysis, 3. the procedure used to consider the mass (along with the support stiffness) if the pipe support is not dynamically rigid, and 4. the same information [(1), (2), and (3) above] for the building steel/structure (i.e., beyond the NF jurisdictional boundary) and for equipment to which the piping may be connected to.</p>	<p>The initial piping analyses will assume all supports rigid (except for the few cases where the actual support structures are included in the piping model), and therefore utilize the default rigid support stiffness values contained in the analysis program. In addition, the initial pipe support designs will be developed to create a rigid support, based on the deflection check criteria given in Section 6.7 of the topical. If for some reason, a rigid support cannot be achieved, an actual support stiffness will need to be developed for the support noted, as well as for the other supports in the model.</p> <p>Typically, unless the support is a very simple structure, a frame support will be modeled using an analysis program such as GT STRUDL. This model will include the self-weight of the support, and will also be used to establish the deflections needed for the stiffness checks. Note that this model will include any flexible building steel, as applicable. If the deflection checks do not show rigidity, the model can be used to</p>	<p>Not Acceptable.</p> <p>(1) Explain and justify the definition of rigid supports (e.g., frequency greater than some value with the mass of the support and contributing pipe spans in each direction), default rigid support stiffness, how the rigid support stiffness corresponds to the definition of rigid supports, and how do the deflection requirements in TR Section 6.7 ensure the supports are rigid. (2) Since GT STRUDL may be used for evaluation of pipe supports, provide the information and validation approach in accordance with the request made in RAI EPR-16 for piping computer codes. This should be done for GT STRUDL and any other structural computer code that may be used.</p>

	<p>justification.</p> <p>B. Since the piping and support structure damping value may be different per RG 1.61, discuss what damping value will be used in the response spectrum analysis when the support structure is also modeled as part of the piping analysis. See also RAI EPR-32.</p>	<p>site in the form of ground motion. As such, the excitation for the support's attachment to the building will be applied to the self-weight of the structure in the form of response spectra g values. For other fluid dynamic transient events within the piping system, forces from the fluid moving along the pipe are included in the pipe support loads for that event, but any subsequent excitation of the support structure itself for the fluid dynamic event will not be evaluated, as the forcing function at each support beyond applied piping loads will be minimal, and not usually defined. This is standard practice in pipe support design. The supports are typically not modeled with the piping.</p> <p>B. In most cases, Revision 1 of RG 1.61 calls for 4 percent damping for the piping analysis. Similarly, the RG allows for 4 percent damping for welded steel or bolted steel with friction connections and 7 percent for bolted steel with bearing connections, which would be</p>	<p>values to be used in the evaluation of support self weight response to the SSE event. The current staff position is to use RG 1.61, Rev. 1 March 2007. Also, using the current version of RG 1.61 for supports and piping results in a consistent set of criteria for piping systems. Explain whether this approach will be followed or why not.</p> <p>B. Not Acceptable. The response did not address the requested information. When the support is modeled in the piping analysis, if the damping values are different for the supports and the piping, how is damping treated? [i.e., is the lower (more</p>
