CONFERENCE CALL WITH TVA IN REGARD TO WATTS BAR

At TVA's request, a number of hydrologic and hydrology-related matters were discussed during a call on April 25, 1972. These issues arose as a result of our (J.Hulman) review of TVA's responses (Amend 5) to our questions.

Our main concerns are (1) whether there will be a wave impinging on plant structures (and with what force) when the earthen portion of Watts Bar dam fails during PMF and (2) the effect at the site of seismic failures of upstream dams (Ft. Lauden, Melton Hill, Tellico).

TVA indicated they would file an amendment to include most, if not all, the information we want.

Principal participants were:
