Nuclear Regulatory Commission
Attn: Scott Newberry
Watts Bar EIS
Washington, DC 20005

Dear Mr. Scott Newberry,

I am writing this letter in regards to the Watts Bar Nuclear Power facility in Spring City, Tennessee. I would like to formally request that the Nuclear Regulatory Commission take into consideration the cumulative impacts the plant will have on sight and off when writing the Environmental Impact Statement. It has been brought to my attention that the NRC does not have to consider the offsite impacts of highly radioactive waste when writing an EIS. This seems to be a ridiculously too risky

way of doing business. I would like to see you change this practice and personally make sure it's considered in the Watts Bar EIS. I'm not sure if you have ever been to the beautiful Tennessee Valley Area, but I, among several other folks, live here with respect and admiration for the land and all its inhabitants. Watts Bar is clearly much too dangerous a facility for even the most insane person to consider starting up. As I am sure you are aware, Watts Bar has been rated with the highest probability of a core meltdown accident than any plant in the United States. And, even if this gashly event were to never occur, the damage to the land, people, and other species in this area will be gravely irreversible if Watts Bar is dared to go on line. Please, consider the future of the Tennessee Valley and the rest of the nation when conducting the EIS. Thank You. Sincerely,
Debra Jack
