Region III received a call from a reporter at Fortune magazine, who is working on a larger story on nuclear power, but was "fact checking" a specific question on Davis-Besse - did the NRC have a photo showing streams of boric acid on the reactor vessel head during the 2000 refueling outage. He was told, based on the OIG report, that a Davis-Besse engineer said that he showed the photo and the accompanying condition report to the resident inspector. The resident inspector did not recall seeing them but did not dispute the possibility.
