

362 Binkley Dr.
Nashville, Tn. 37211
October 20, 1995

Dr. Shirley Jackson, Chairperson
US Nuclear Regulatory Commission
Washington, D. C. 20555-0001

Dear Dr. Jackson:

In 1993, The Tennessee Valley Authority (TVA) sold off the securities in its decommissioning fund and used the proceeds for its power program. See enclosed letter addressed to me from John M. Hoskins, Vice President and Treasurer of TVA, dated September 28, 1995 and copies of pages from TVA's "Energy Vision 2020, (Draft, Volume 2, dated 7/95, page T3-8).

Also enclosed is my response to Mr. Hoskins' letter, with supporting documentation.

Did TVA ask NRC's permission to sell its decommissioning funds and divert the proceeds to TVA's power program? Did NRC give its permission?

I am particularly concerned because of the impending fuel loading of Watts Bar. I believe that this clearly shows that TVA does not nor will it have sufficient money to decommission three reactors at Browns Ferry, two reactors at Sequoyah, and should it ever become radioactive, Watts Bar.

Clearly the raiding of the decommissioning funds shows what desperate financial straits TVA is in. The only requirement that NRC has concerning TVA's financial condition is to be assured that TVA has sufficient funds to build and operate all its nuclear plants safely and to be able to decommission them. As the August 1995 GAO report, "Tennessee Valley Authority, Financial Problems Raise Questions About Long-term Viability," (GAO/AIMID/RCED-95-134) clearly shows, only Congress and the NRC have any oversight over TVA. You are the agency that is entrusted with protecting the public's health and safety as far as nuclear plant construction and operation is concerned. Therefore, I appeal to you.

page 2

TVA is fast approaching its debt ceiling, and is even having to go into partnership with a private company to develop a hydro pumped storage peaking plant. I do not believe that TVA is financially solvent enough to operate its coal, hydro, and nuclear plants safely and to decommission the nuclear facilities when their licenses expire. I further do not believe that TVA is earmarking nearly enough money for its decommissioning fund, and the raiding of the fund negates the advantage of compounding interest.

Please notice the enclosed "Appendix A, TVA Watts Bar Unit 1 Decommissioning Cost Estimates Prepared for Greenpeace by David A. Blecker - MSB Energy Associates, Inc., August 10, 1995." According to this document, to decommission Watts Bar if it operates for 30 years could cost almost \$6 billion. That is for one reactor. Adding the five reactors already licensed clearly indicates that TVA is not financially qualified to safely operate Watts Bar.

Therefore, because of the aforementioned, and for many other safety concerns, I hereby humbly request that you deny TVA its nuclear fuel loading license and operating license for the Watts Bar Nuclear Plant.

Most sincerely,

Jeannine Honicker

John M. Hoskins
Vice President and Treasurer

September 28, 1995

Ms. Jeannine Honicker
362 Binkley Drive
Nashville, Tennessee 37211

Dear Ms. Honicker

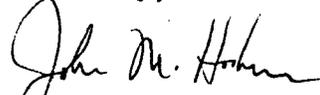

This letter is written in response to your request for information on TVA's decommissioning fund on September 26.

TVA maintains a decommissioning fund that will be used to clean up all the areas exposed to radioactivity once the operating license of a nuclear plant expires. This fund currently has a balance of \$261 million. Next year TVA will make further contributions to this fund.

TVA sold the \$210 million of investments in this fund in 1993 due to market conditions that created an unusual opportunity for a significant gain in these securities. TVA used the proceeds of this sale for the power program. This fund was replenished in 1994 and 1995.

If TVA had maintained the original investment portfolio, it would currently have a balance of \$245 million. All of TVA's decommissioning investments have been in high quality fixed income investments.

Sincerely,

John M. Hoskins

DRAFT

FIGURE T3-10. TVA's Nuclear System

Nuclear in Fiscal Year	Summer Net Capacity (MW)	EAF (%)	Heat Rate (Btu/kWh)	Fuel Cost (\$/MWh)	Total O&M (\$/kW)	Total A&I (\$/kW)
1994 (Actual)	3,282	65.6	10,140 ¹	11.0 ²	90.7	29.8 ³
2005	5,517	67	10,475	5.4	113.6	19.1

¹ Sequoyah 2 heat rate given is typical of all nuclear units.

² In 1994 TVA took steps to write off sunk interest charges on excess fuel inventory. This will result in future fuel expenses that are significantly lower but are more in line with market costs.

³ Capital expenditures for SON 1, SON 2, and BFN 2 plus central office TVAN only.

TVA expects an increase in availability factor for its nuclear system due to plant upgrades. Fuel costs are projected to drop significantly following the write-off of interest charges on excess fuel inventory in 1994.

reactors, such as those at Browns Ferry, are not as susceptible to vessel aging as pressurized water reactors; second, these units have been brought up to current standards. TVA will follow closely the proposed Nuclear Regulatory Commission rule making on license extensions, but TVA anticipates these facilities will be available over the Energy Vision 2020 study period.

TVA has established a nuclear decommissioning fund for all of its operating nuclear reactors. Investments of power funds have been made since 1982 to provide for the accumulation of funds for decommissioning nuclear plants. By September 1993, the lowest interest rate environment in 20 years resulted in a situation where the market value of the decommissioning investments was significantly higher than their book value of \$210 million. TVA elected to exercise the flexibility of the internal fund, and sold the investments through a competitive bid for \$373 million.

TVA elected to return the proceeds to the decommissioning fund over a three year period beginning in fiscal year 1994. At the end of fiscal year 1994 the fund had \$150 million. Plans

are to add an additional \$100 million by the end of fiscal year 1995 and an additional \$123 million by the end of fiscal year 1996.

TVA's policy is to collect funds for decommissioning through rates based on a constant dollar amount adjusted for inflation over the life of the operating license of a nuclear plant. This policy is based on the theory that all ratepayers that benefit from the electric production of a nuclear plant should share equally in the cost of decommissioning. If TVA front-loaded the collection of the nuclear plant decommissioning funds, this would put an undue burden on the ratepayers receiving power generated during the early years of operation of the nuclear plant. On the other hand, if not enough funds were collected throughout the life of the plant, the ratepayers receiving power at the end of the operating license would have an unfair decommissioning burden.

Decommissioning expense has been recovered from ratepayers annually based on the present value of amounts not provided through earnings on the fund. In fiscal year 1990, these

FIGURE T3-11. Projected Availability of Power Through Interchanges

YEAR	BLOCK 1		BLOCK 2		BLOCK 3	
	Quantity (MW)	Price \$/MWh	Quantity (MW)	Price \$/MWh	Quantity (MW)	Price \$/MWh
1995	250	23	250	27	1800	40
2000	300	27	300	32	1500	56
2005	0	N/A	300	39	1500	75
2010	0	N/A	0	N/A	1100	106
2015	0	N/A	0	N/A	1000	135
2020	0	N/A	0	N/A	1000	165

This figure shows the amount of power expected to be available through the interchange system through 2000. For each year, power is shown to be available in blocks with varying cost.

DRAFT

collections amounted to \$18 million. TVA temporarily suspended decommissioning collections from customers after operating license life extensions were obtained for Browns Ferry and Sequoyah. The temporary suspension was made in an effort not to front-load decommissioning collections. Cashing in the gain on the market value of the fund in 1993 has resulted in a reduction of the annual decommissioning expense collection through rates to \$13 million currently based on a projected long-term return of 8 percent. If alternative investments with a higher rate of return could be achieved, the annual collection could be lowered further. Collections for the decommissioning fund will resume in fiscal year 1995.

INTERCHANGES WITH NEIGHBORING UTILITIES

TVA has various types of interchange arrangements with neighboring electric systems that allow TVA and these utilities to buy, sell, and exchange power at times when it is mutually beneficial to do so. TVA anticipates that there will be some quantities of non-firm spot market power available, even during peak periods, for the future. Spot market power is power that is available for purchase on the open market, usually surplus power that may be available at any given time from a generating utility. "Non-firm" implies that TVA will not pay capacity charges for the power, and other utilities will not guarantee that it is available.

For planning purposes, TVA has assumed the quantities and price shown in *Figure T3-11*. These blocks are representative of purchase power from neighboring utilities. Depending on the economic loading of the power system, these blocks can be used to offset more expensive internal generating resources.

TVA also anticipates that it will be able to make off-system sales because of differences in timing of system peaks between TVA and neighboring utilities. Over the Energy Vision 2020 study period, these interchange purchases and sales are anticipated to be roughly in balance.

TRANSMISSION SYSTEM

TVA's transmission system serves an area of more than 80,000 square miles, serving a population of approximately 7.6 million. The system includes approximately 16,000 miles of transmission line, including 9,800 miles of 161,000 volt lines and 2,400 miles of 500,000 volt lines.

The system is used to transmit power to 160 distributors of TVA power. These distributors include 50 electric cooperatives, 107 municipal electric systems, and 3 county-operated systems. TVA also directly serves over 60 large industries and Federal installations. In addition, the transmission system is connected directly with 13 neighboring utilities. These interconnections allow TVA to buy power from and sell power to other utilities and to wheel electricity from one utility to another using TVA's power transmission system.

Figure T3-12 lists the electric utilities with which TVA has exchange agreements and the number of interconnections TVA has with each.

TVA is a member of the Southeastern Electric Reliability Council, a voluntary industry oversight organization dedicated to promoting electric system reliability by identifying and enforcing good engineering and operating practices. The Southeastern Electric Reliability Council is a subgroup of the North American Electric Reliability Council, which provides oversight for the entire North American grid. Through these arrangements, TVA has access to emergency backup power.

Nashville, Tn. 37211
October 20, 1995

Mr. John M. Hoskins, Vice President & Treasurer
Tennessee Valley Authority
400 West Summitt Hill Rd.
Knoxville, Tn. 37902-1499

Dear Mr. Hoskins:

Thank you for your letter of September 28, 1995 responding to my request for information concerning TVA's decommissioning fund. I am afraid the letter raises further questions.

I notice in TVA's "Energy Vision 2020" (Draft, volume 2, dated 7/95, page T3.8) the following:

"TVA has established a nuclear decommissioning fund for all of its operating nuclear reactors. Investments of power funds have been made since 1982 to provide for the accumulation of funds for decommissioning nuclear plants. By September 1993, the lowest interest rate environment in 20 years resulted in a situation where the market value of the decommissioning investment was significantly higher than their book value of \$210 million. TVA elected to exercise the flexibility of the internal fund, and sold the investments through a competitive bid for \$373 million.

"TVA elected to return the proceeds to the decommissioning fund over a three year period beginning in fiscal year 1994. At the end of fiscal year 1994, the fund had \$150 million. Plans are to add an additional \$100 million by the end of fiscal year 1995, and an additional \$123 million by the end of fiscal year 1996."

Your letter stated:

"TVA sold the \$210 million of investments in this fund in 1993 due to market conditions that created an unusual opportunity for a significant gain in these securities. TVA used the proceeds of this sale for the

power program. This fund was replenished in 1994 and 1995.

"If TVA had maintained the original investment portfolio, it would currently have a balance of \$245 million. All of TVA's decommissioning investments have been in high quality fixed income investments."

Why does The Energy Vision 2020 document say \$373 million and your letter says \$210 million?

If the fund or funds had to be sold to realize the appreciation, why were the proceeds not immediately reinvested as good management of the decommissioning fund would dictate, instead of being put in the power program? If it was sold and immediately reinvested, what would be the value of the fund today?

How did you arrive at the conclusion of your letter that the fund would be worth only \$245 million if it had been left alone, and why is the balance currently \$261 million?

If in fact the fund was worth only \$210 million, who bought it for \$373 million? Was the \$210 million the amount of TVA money that had been invested since 1982 that had grown to \$373 million, or was the current value \$210 million and by competitive bid some entity paid TVA \$373 million? Who would have made such a bad financial move, and why would they do it? Specifically, who did purchase it?

If in fact the decommissioning fund was invested in high quality fixed income investments and had grown to a value of \$373 million when it was sold in 1993, as the Energy Vision says, how much would it have been worth at the end of fiscal year 1996 versus how much it will be worth with the repayment plan as outlined in Energy Vision 2020?

Are you still following the plan outlined in Energy Vision 2020, or have you modified that repayment schedule?

Did you inform the NRC of your plans to empty the decommissioning fund in 1993 and add the proceeds to the

power program? Did they give you a written authorization to do this?

How is this fund going to be adequate to decommission three units at Brown's Ferry and two units at Sequoyah? How much more per year will you add to include the decommissioning costs of Watts Bar?

What is the formula that you used to determine how much you will need to decommission each unit? When do you anticipate decommissioning each unit? What are your plans for disposing of the radioactive waste that is accumulating at each reactor site, both in and out of the spent fuel pool, when the time comes to decommission each unit? In effect, the whole plant will be waste, so just how do you plan to dispose of it and clean up the entire site?

Enclosed is Appendix A from MSB Energy Associates report entitled TVA Watts Bar Unit 1 Decommissioning Cost Estimates. How do your guidelines, formulas, calculations, and assumptions compare with theirs?

Sincerely,

Jeannine Honicker

APPENDIX A

TVA Watts Bar Unit 1 Decommissioning Cost Estimates

Prepared for Greenpeace
by David A. Blecker - MSB Energy Associates, Inc.
August 10, 1995

Summary:

A review of current literature and cases leads to the following estimate of Watts Bar Unit 1 (WB1) decommissioning costs (expressed in 1994 dollars for a 1996 shutdown):

Minimum Cost: \$475 million
Maximum Cost: \$665 million

These estimates do not include contingency factors for unknown and unquantifiable events. Contingency factors are designed to include such events as labor problems, weather stoppages, equipment/tool problems, regulatory changes and procedural changes. In New York, the Shoreham decommissioning study added a 40.7% contingency factor and in 1987, the California Energy Commission ordered a 50% contingency factor for the Diablo Canyon decommissioning. If a 50% contingency factor is added to the WB1 decommissioning cost estimate, the costs increase to:

Minimum Cost: \$713 million
Maximum Cost: \$996 million

An year by year estimate of the decommissioning costs that would be incurred if TVA delays shutting down WB1 are shown on the attached table.

These numbers were derived using three methods described below.

Method 1 uses a simple linear regression solely as a function of time based on an analysis of 157 nuclear decommissioning cost estimates. Its formula is given by:

$$\text{Cost (\$/kW)} = 71.92 + (18.27 * \text{year})$$

Method 2 uses also uses a linear regression but adds variables for time, plant type (PWR or BWR), sister units and plant size. The following regression equation was used:

$$\text{Cost (\$/kW)} = 256.75 + (20.43 * \text{year}) - 38.39 - 57.16 - (0.1538 * \text{MW capacity})$$

Method 3 is based on the arithmetic average of 14 nuclear decommission cost estimates and is given by the expression:

$$\text{Cost (\$/kW)} = 465 \text{ per kW}$$

Assumptions:

Typical NRC operating permit license lifetime equals 40 years however no nuclear plant has ever reached its allowed end-of license period. The oldest operating reactor in the U.S. is Big Rock Point 1 in Michigan at 30 years. Fifteen reactors have been shut down early with economic factors most often cited as the predominant cause. For planning purposes, 30 years is the recommended "energy producing life" for operating nuclear reactors.

The numbers presented herein assume TVA would start Watts Bar 1, and then shut it down in 1996 as its true costs become apparent. For an early shutdown like this, Methods 1 and 2 are the appropriate values to use. If the shutdown occurs later in time, then Method 3 which includes the effects of inflation and a real escalation rate should be used.

If TVA fuels Watts Bar 1, will they incur decommissioning costs?

Yes, any fuel load-out and associated system testing will force TVA to incur decommissioning costs.

If WB1 is fueled and decommissioning costs will be incurred, why not just let the plant run and pay for it later?

The cost to decommission a nuclear plant increases with the amount of time the plant has been fueled and operating. If Watts Bar 1, is fueled when planned, it will incur some decommission costs even if TVA decides to shut it down before commercial operation. But the longer it remains fueled and is subject to low- and high-power testing, the more expensive it will be to decommission the unit. This is a result of several factors: 1) Hot plant operation consumes fuel which in turn generates high and low level radioactive wastes. 2) Neutron bombardment (a byproduct of fission) of the containment structure causes the structure's metals and concrete to become radioactive, and 3) Low levels of tritium are produced from neutron bombardment of hydrogen in the primary cooling system resulting in a contamination of the primary cooling loop components.

Studies have indicated that the escalation rate of decommissioning cost estimates has run as high as three to 9 percent over the rate of general inflation. This means that each year TVA waits to decommission WB1, the expected costs to decommission the plant will rise exponentially. To demonstrate the effect of an escalation rate in this range, consider that the value of an investment made today will double in only 10 years if it is earning seven percent annually.

Two factors should be clear:

- 1) It will be less expensive to shut down Watts Bar 1 if it has not been fueled
- 2) Even is it is fueled and tested, it will still be significantly less expensive to shut it down sooner rather than later.

Won't TVA's payments to its nuclear decommissioning fund cover those costs?

A preliminary review of TVA's financial statements indicate it is highly unlikely that TVA is accurately funding decommissioning accounts. The TVA 1994 Annual Report lists a fund balance of \$264 million. Additionally, the TVA's Annual Report of Public Electric Utilities states that the decommissioning provision for Brown's Ferry is \$190 million/unit and \$150 million for each Sequoyah unit (1990 dollars). If TVA's WB1 decommissioning estimates are similar, they will clearly encounter severe financial problems at the plant's end-of-life.

Why is decommissioning cost estimation important?

Accurately accounting for nuclear decommissioning costs is important for several reasons. First and foremost is so that TVA can establish and properly fund decommissioning accounts now to ensure the required funds are available when they are needed. Failure to do so may result in huge rate increases for TVA customers or Federal bailouts at the time of decommissioning. The second reason is so that electricity costs and rates accurately reflect the full cost of generating electricity from nuclear power.

John M. Hoskins, Vice President and Treasurer
Tennessee Valley Authority
400 West Summit Hill Drive
Knoxville, Tn. 37902-1499

Dear Mr. Hoskins:

Under the Freedom of Information Act, I request all documents dealing with the selling of TVA's nuclear plant decommissioning fund in 1993.

In a September 28, 1995 letter to my wife, Jeannine Honicker, you state:

1. TVA maintains a decommissioning fund that will be used to clean up all the areas exposed to radioactivity once the operating license of a nuclear plant expires.
2. This fund currently has a balance of \$261 million.
3. TVA sold the \$210 million of investments in this fund in 1993 due to market conditions that created an unusual opportunity for a significant gain in these securities.
4. TVA used the proceeds for the power program.
5. This fund was replenished in 1994 and 1995.
6. Next year TVA will make further contributions ...
7. You fail to state the specific dollar amount for which these investments were sold, stating only that the securities brought TVA a "significant gain." But then you note: "If TVA had maintained the original investment portfolio, it would currently have a balance of \$245 million."
8. All of TVA's decommissioning investments have been in high quality fixed income investments.

Now, sir, you are vice president and treasurer, but your numbers don't jibe with the numbers in TVA's *Energy Vision 2020* (draft, vol. 2, dated 7/95, pg. T3.8). You say these

"high quality fixed income investments" for TVA's decommissioning program would be worth \$245 million if held today. But TVA's 2020 report plainly states the investments were sold "through a competitive bid for \$373 million."

9. You say the decommissioning fund was replenished in 1994 and 1995, currently has a balance of \$261 million and that TVA will make "further contributions" next year.

After plowing the \$373 million profits into the power program, 2020 says, "TVA elected to return the proceeds to the decommissioning fund over a three-year period beginning in fiscal year 1994. At the end of fiscal year 1994, the fund had \$150 million. Plans are to add an additional \$100 million by the end of fiscal year 1995, and an additional \$123 million by the end of fiscal year 1996."

I hope you can understand how puzzled I become when (a) I try to reconcile your numbers with those in the 2020 report and (b) wonder why you as vice president and treasurer did not immediately reinvest that \$373 million in 1993 to build up the decommissioning fund further. If the \$373 million were invested at 8% compounded over a 2-year period, the decommissioning fund - if my math is correct - would have \$435,067,600, instead of its 1996 \$373 million value.

I specifically request documents showing who bought these securities, book-valued at \$210 million, for \$373 million, and why the proceeds went into the power fund instead of being reinvested in the decommissioning fund, which, according to non-TVA experts, falls far short of meeting TVA's needs if Browns Ferry or Sequoyah should have a rapid reactor disassembly forcing either to be decommissioned.

I request further that all copying fees be waived.

Sincerely,

Dolph Honicker
