### Sa. DESCRIPTION OF CONDITION

#### HCR VAHINDASSE 13

WENSWP8306 - the scope of CRB 76-5
WENSWP8311 - Use of CRB 76-5 to analyse schedule 108 stainless
stril piping. This piping not within the scope of
CRB 76-5

\* Partially included in this MCR (last sentence only).

#### 11. CORRECTIVE ACTION

#### HCR VBHSWP8252 R3

#### Unit 1

CRB 76-5 has been revised to clarify some areas of the criteria and provide guidelines in others. However, in order to minimize additional field work the verification of qualification of the piping is normally evaluated against code requirements instead of solely CRB 76-5. The verification methods utilize hand calculations as well as computer analysis to qualify piping analyses which do not meet the specific rules of CRB 76-5.

The majority of the WBP corrective action on Unit 1 was carried out by a Personal Services Contractor; however, some was performed by WBP personnel.

### Unit 2

At present, there is no remaining alternate analysis work using CEB 76-5 to be done under this MCR. Some Unit 2 analyses have been qualified using the action described above for Unit 1. This work is presently complete.

For the remaining Unit 2 piping, a simplified (T-pipe computer) analysis will be used rather than CEB 76-5.

### 18. ACTION REQUIRED TO PREVENT RECURRENCE:

#### Unit 1

 CEB 76-5 has been revised to clarify some areas and provide guidelines in some previously unaddressed areas. Portions of SWP EP 43.21, Alternate Analysis Piping Systems - Documenting and Verifying, address various technical areas. The 47A053 drawings have been revised (under ECN 3542) to clarify some areas and to require all piping supported in accordance with these notes to be reviewed by WBP.

- MY EP 43.21 has been issued to control the analysis of alternately analyzed piping in WEP's scope. In the future CEB will not analyze WEH piping by alternate analysis. Any reanalysis of their current alternate analysis problems will be simplified (T-pipe).
- 3. Training in alternate analysis methods has been provided to WBP and COMST personnel. The subjects of these training sessions were CEB 76-5, SWP EP 43.21, and the 47A053 drawings as appropriate.

#### Unit 2

Although the actions stated for Unit 1 above are applicable to some Unit 2 problems, the majority of the Unit 2 problems are being analyzed using simplified (T-pipe computer) analysis. In the future, CEB will not analyze WBM piping by CEB 76-5 alternate analysis. Any reanalysis of Unit 1 alternate analysis problems or new analysis problems will be done by simplified (T-pipe) analysis.

|                                 | The above condition represents a situation which, if it had not been detected, may result in the inability of pipe supports installed by this note to accomplish their safety function. This condition could affect any pipe support installed in a Category I structure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                       |     |  |  |  |  |
|                                 | This deficiency was identified as a result of EN DES investigation into several Black and Veatch findings that concerned the use of the drawing. The Black and Veatch findings reviewed did not result in any hanger installations being identified as nonconforming to drawing 47AO50-lT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                       |     |  |  |  |  |

|          | The designer and checker did not anticipate that any other types of bolt sizes larger than 7/8 inch in diameter would be used in pipe supports. Later, different type of bolts and larger diameter bolts were used but the note was not revised.                                                                                                                                                                                            |

|          | To alleviate these conditions, EN DES has stopped the use of the note for bolts 1-inch diameter and larger. Drawing 47A050-IT was revised and issued under ECN 3988. Also, a "Construction Specification N3C-928" was issued (February 10, 1983). This specification provides requirements for locating attachments on embedded plates, and will require a detailed review of connections of this nature which could be adverse conditions. |

NONCONFORMANCE REPORT GENNEB8301 ME AMERICANABLE CAUSE: (REQUIRED IF SIGNIFICANT) EN DES failed to comply to IESE-279 sec. 4.6 and sec. 4.22. The routing of the cables nondivisional resulted from the lack of their identification as being in this protection system. This fails to meet single failure criterion. 17 THIS IS A GENERIC CONDITION ACTION REQUIRED TO PREVENT RECURRENCE: (REQUIRED IF SIGNIFICANT) All logic and control drawings are checked through the Electrical Engineering Support Branch to ensure compliance to accepted IEEE standards. Further review is required per EN DES-EP 4.25. Further review is an evaluation of a drawing beyond the checking activity which is required to ensure the acceptability of a design. This further review procedure was initiated November 3, 1977. "INDEPENDENT REVIEW: 74, PBL 6/14/83 LABOR EST. ( ), ACT. ( ) MH 21 SCHEOULE EST. ( ), ACT. ## EN DES NONCONFORMANCE REPORT COMPLETION VERIFICATION SHEET

### NCR NO. WENSWP1312

SIGNIFICANT YES D NO MA

REPORTABLE YES O NO X

- A. Have any analyses, contracts, memorandums, etc., requiring EN DES work been generated? Yes D No X If yes, list in (C) below.
- B. Have all ECNs related to the NCR been issued?

  N/A K Yes D No D If yes, list in (C) below.
- C. Documents related to the NCR (ECN, analyses, memos, contract No., etc.)

# TASK FORCE REPORT EVALUATION OF BLACK AND VEATCH FINDINGS

### I. EXECUTIVE MOMARY

A task force composed of senior OEDC and OQA engineers, working under the general direction of the Independent Review Policy Committee, was formed to establish and administer an evaluation process for the 428 Black and Veatch (BAV) findings with respect to the design and construction of the Watts Bar unit 1 auxiliary feedwater system. One objective of this evaluation was the identification of appropriate corrective action plans for the deviations from licensing commitments identified by Black and Veatch and their generic examples in all Watts Bar systems. Another objective of this evaluation was a determination of the nuclear safety significance of the deviations had they gone undetected and uncorrected. Of the 428 findings, the task force determined that 280 findings did not represent deviations from the licensing commitments and were placed in a category which did not require further evaluation. The remaining 148 findings were sorted into 25 categories consisting of either individual or groups of similar findings. The task force administered this evaluation process and concurred with all corrective action plans for all categories which it deemed to represent a deviation from licensing commitments and determined the nuclear safety significance of the deviations. (Refer to Appendix E, Glossary of Terms, for definitions of the terms "licensing commitments" and "licensing bases" as used in this report.)

Upon completion of the evaluation process, the task force was able to draw conclusions with respect to the deviations from licensing commitments identified by Black and Veatch and their generic examples in the completed work of other Watts Bar systems. The conclusions were:

- o Effective implementation of approved corrective action plan: will bring these deviations in completed work up to a baseline of acceptability with respect to the licensing bases,
- o Effective implementation of approved corrective action plans will improve the achievement and maintenance of a baseline of acceptability in the future performance of similar work,
- o These deviations would not have prevented the performance of any nuclear safety function which is part of the licensing bases.

# II. TASK FORCE FORMATION AND RESPONSIBILITIES

In September 1982, TVA committed to perform an independent review of a selected Watts Bar (WBN) unit 1 system. This review was to verify that TVA had properly developed an adequate design/construction from the bases and criteria specified in its licensing application to meet the functional licensing requirements of the system. This independent review was conducted on the unit 1 auxiliary feedwater (AFW) system by Black and Veatch (B&V). As part of TVA's overall approach to support the Watts Bar independent review, a policy committee was established with top managers from the Office of Engineering Design and Construction (OEDC), the Office of Quality Assurance (OQA), and the Nuclear Safety Review Staff (NSRS).

Black and Veatch's review of the auxiliary feedwater system resulted in the identification of 428 findings. B&V's report identifying these findings was issued to TVA and NRC on April 12, 1983. Prior to the formal issuance of this report, the policy committee determined that it was appropriate to move forward with an evaluation of the B&V findings to determine their applicability to other WBN systems other than the auxiliary feedwater system. To accomplish this evaluation, a task force of senior OEDC and OQA personnel was established by the policy committee on February 18, 1983 (reference 1). The task force members are identified in Appendix A.

The task force was specifically assigned responsibilities by the policy committee which included performance of the following functions:

- o Recommend an overall methodology for evaluating the B&V findings
- o Select and assign OEDC line organizations to perform the final evaluation
- o Establish and maintain surveillance over implementation of the evaluation
- o Goordinate the utilization of B&V information generic to other TVA nuclear units
- o Document and ensure retention of records generated by the evaluation.

With these defined responsibilities, the task force began functioning on February 22, 1983.

# III. EVALUATION OBJECTIVES AND METHODOLOGY

### A. Objectives

The initial efforts of the task force were directed towards the development of a methodology to manage the utilization of the independent design review results for the maximum benefit to TVA. The objectives of the task force's methodology were to identify appropriate corrective actions to:

- o bring past work generically up to a baseline of acceptability, and
- o improve the achievement and maintenance of a baseline of acceptability in future work

To satisfy these objectives the task force defined the seven step action plan below:

- Task force reviews, categorizes, and preliminarily assesses the findings to streamline the evaluation process and identifies the responsible line organization to handle each category.
- Task force initiates final evaluation of each category by the responsible organization.
- Task force issues an initial phase report to provide a detailed description of the categories and the evaluation methodology.
- 4) Task force reviews the issued B&V report and makes any appropriate modifications to the evaluation process.

- Responsible organizations complete final evaluations and identify appropriate corrective actions.
- 6) Task force reviews and concurs in the adequacy of the evaluations and in the definition of corrective actions for each category.
- 7) Task force submits progress reports to the policy committee on the implementation of the evaluation process.
- B. Evaluation Process

To implement this action plan, the task force developed the evaluation process illustrated in Figure 1 (flowchart of evaluation steps). This method was approved and revised by the Policy Committee in references 2, 3, 4 and

- 5. This method required:
- 1. Review and Categorization of the Findings by the Task Force (Steps 1 and 2) In the course of the task force's evaluation of the findings, category 1 was designated as the group of findings that did not require detailed evaluation by the line organizations but might require additional input to close out the B&V finding. Specifically, category 1 included:
  - 1(1) TVA and B&V considered there to be no deviation.

1(2) - B&V identified deviation from final design or construction requirements for which TVA determined the work to be incomplete.

To be considered incomplete, the CONST accountability system and/ or OEDC deviation control system must have identified the remaining work prior to B&V identification.

Note: Some finding warranted categorization for further review because the status of the pertinent corrective action plans in existence at the time of the independent design review would not clearly have maintained a baseline of acceptability for future work once completed work was brought up to a baseline of acceptability. However, since there was reasonable assurance that the plans could have brought completed work up to a baseline of acceptability, these were not considered to be examples of completed construction which did not satisfy the licensing requirements.

- 1(3) B&V findings which required further review to determine if
  a deviation existed since OEDC disagreed with the B&V conclusion.

  Upon completion of the review, all of these findings were
  assigned to another category.
- 1(4) B&V findings which were identified as "Confirmed" or "Open" in B&V

  April 1983 report, for which the TVA position was that the licensing tasis was satisfied. The justification for the TVA acceptance
  of the conditions described in the B&V findings was formally
  documented.

The findings that were not classified as category 1 were grouped to the extent practical and assigned unique category numbers and placed on evaluation sheets (Appendix C) for further detailed review. The classification of findings resulted in the assignment of 25 categories.

Each of the 25 categories was reviewed in detail by a task force member. This review included examination of both OEDC's and Black and Veatch's responses to the findings and discussions by individual task force members with TVA engineers and managers. The task force used the information compiled by the task force member to complete its preliminary appraisal on the evaluation sheets. This preliminary assessment provided an initial direction for the evaluation and corrections necessary for the development of the final TVA position on the category.

After completion of this preliminary evaluation, the task force designated a responsible line organization to develop from an objective basis a proposed final TVA position for each step of the evaluation.

The evaluation performed by the task force members and the line organization involved the following areas.

2. Evaluation for Cause (Step 3) - The objective of this review was to develop a basis for a plan to identify, with reasonable assurance, all similar examples of the deviation elsewhere in TVA nuclear facilities beyond the scope of the Black & Veatch review. This objective could be satisfied by evaluation of groups of findings to determine the most direct control system breakdown (cause) that resulted in the deviations in engineering activity results.

Working upward in the procedural control system, this would typically be the highest level procedural control which was inadequate (lower tier vs. upper tier). Working upward in the performance system this would typically be the highest level where performance or requirement for performance was inadequate (engineer, section, branch, or division level).

Typical examples of direct causes:

- o The division level design control procedures did not require calculations to support all aspects of design.
- o The section supervisors did not enforce the requirement for drawing compatibility.
- o The engineer and checker did not follow the design change procedure.
- 3. Evaluation for Generic Examples (Step 4) Based upon the cause(s) identified in step 3, this review sought to predict the potential scope of occurrence of deviations similar to those in the category. This was

achieved by (1) a review of all work products within that scope to identify the generic examples or (2) selection of a reasonable sample of related activities just outside the potential scope predicted in the preliminary assessment. If no further deviations were identified during evaluation of the sample, the scope of the deviations was considered to have been confirmed. The existence of similar deviations indicated that the cause(s) identified in step 3 needed to be broadened and the "Evaluation for Generic Cause" (step 4) reiterated to evaluate the new predicted scope.

· 在一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间, 我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间,我们就是一个时间 4. Evaluation for Licensing Basis Satisfaction (Step 5) - If a deviation represented a failure to satisfy the licensing commitments, TVA policy and regulations required the deviation and its generic examples to be corrected and efforts made to avoid the occurrence of similar deviations prior to the conduct of licensed activities. Therefore, the "A" side of the evaluation process (6A through 12A) was performed and completed consistent with the schedule for the conduct of licensed activities.

However, there was another situation for which TVA had greater flexibility in determining the degree of corrective actions applied and the schedule for implementation. The "B" side of the evaluation process was used for the non-safety related portion of a nuclear unit. The design/construction of this portion did not have relatively clear regulatory requirements on quality. However, much of this requirement significantly

affected TVA's objectives for nuclear safety, personnel safety, plant operability or plant reliability. For the generic examples of deviation identified in step 4 of the evaluation process which were not safety-related, TVA could choose to apply corrections on a schedule commensurate with the importance of the deviation to these TVA objectives.

This notification to the task force of this evaluation did not replace required actions under the normal evaluation and licensing notification procedures.

- 5. Identification of Ongoing or Necessary Corrective Action for Completed and Future Work (Steps 6, 7, 9, 10) The objective of this evaluation step was to select the most cost-effective solution which would bring completed work up to a baseline of acceptability and/or achieve and maintain a baseline of acceptability for future work. Selected corrective action was to be implemented through the existing OEDC management control systems.
- 6. Follow-up on Implementation of Corrective Action for Completed Work and
  Future Work (Steps 8, 11, and 12) The task force reviewed the proposed
  corrective actions for past and future work and concurred with the line
  organization on an acceptable corrective action program identified in
  steps 8 and 11. The independent verification of the corrective action
  for past work is provided by the checking, review and inspection built

into the line organizations responsibility and covered by its management control system. The implementation of corrective action for future work is the responsibility of the line organization and will be performed under that management control system. The adequacy of the corrective action for future work will be verified by OQA as a part of the OQA surveillance and audit program. Any problem found by OQA will be handled by surveillance reports and audit findings. The completed evaluation forms presented in Appendix C reflect this approach. This approach was needed to help support the maintenance of a baseline of acceptability in future work.

When the corrective action for past and future work was in a controlled program that required tracking and closures, the task force closed the evaluation step. Therefore, the task force did not verify that the correction action for past and future work identified by the evaluation of the 25 categories has been implemented completely or correctly. These responsibilities rested with the performing organizations and OQA.

#### IV. EVALUATION IMPLEMENTATION

#### A. General

To initiate the evaluation process, the task force evaluated all 428 Black and Veatch findings to determine whether a deviation existed with respect to either TVA's licensing or internal commitments for design, construction or operation. Operational preparedness was not specifically reviewed by B&V, but indications of deviations with respect to these licensing commitments were necessarily a part of this evaluation.

This evaluation was an iterative process which placed all 428 Black and Veatch findings into their final task force categories. See Table 1 for a cross reference of all findings and their categories. The summary of this sorting is as follows:

- Category 1 280 Black and Veatch findings which did not require further review for the purpose of identifying corrective actions were placed in this category. The nature of subcategories 1(1), 1(2) and 1(4) was defined in Section III.A.1.
- Categories 3 through 39 148 Black and Veatch findings which required further review for the purpose of identifying appropriate corrective actions were placed in 25 categories. A brief description of these categories and the associated findings are provided in Table 2.

The line organizations's evaluation of each of these 25 categories was documented on the evaluation forms and returned to the task force. The task force reviewed this information and concurred with the line organization's proposed final TVA position for each step of the evaluation. If the task

force did not concur with the line organization, these catagories were further reviewed by the task force chairman, policy committee chairman, and the line organization until concurrence was achieved.

#### B. Results

The results of the detailed evaluation of the 25 categories were corrective action plans tailored to the nature of the deviation(s) identified by Black and Veatch and their generic examples. For the purposes of this discussion, categories 4, 6 and 30 were split into 4(1), 4(2), 6(1), 6(2), 30(1), and 30(2), resulting in 28 categories. A summary of the type corrective action planned for each category:

- Categories of findings for which TVA has justified a conclusion that no deviation with respect to the licensing commitments existed. The evaluation of these categories resulted in no corrective action required for past or future work. (Categories 31, 32, 33, 34, 36, 38.)
- Categories of findings representing deviations from the licensing commitments which were previously identified by TVA and scheduled corrective action could have been reasonably expected to bring past work up to meet the licensing bases. The evaluation of some categories in this group did result in some modifications to the existing planned corrective action for future work to maintain a baseline of acceptability. (Categories 6(1), 7, 9, 12, 19.)

- Categories of findings representing deviations from licensing commitments which did satisfy licensing bases. Evaluation of these categories resulted in corrective action for future work and, if applicable, corrective action for past management controls. (Categories 3, 4(1), 5, 6(2), 13, 18, 20, 25, 30(1), and 39).
- Categories of findings representing deviations from the licensing commitments which also were deviations from the licensing basis.

  Evaluation of these categories resulted in corrective action for past work and corrective action for future work. (Gategories 4(2), 11, 14, 23, 30(2), 35 and 37.)

The completed evaluation forms documenting these evaluations and indicating task force concurrence in the corrective action plans are contained in Appendix C to this report.

Based on these evaluations the task force concluded the following with respect to the deviations from licensing commitments identified by Black and Veatch and their generic examples in the completed work of other Watts Bar systems:

o Effective implementation of approved corrective action plans will bring these deviations in completed work up to a baseline of acceptability with respect to the licensing bases, o Effective implementation of approved corrective action plans will improve the achievement and maintenance of a baseline of acceptability in the future performance of similar work.

# V. SAFETY IMPLICATIONS

#### A. General

Mear the completion of the evaluation of task force categories for corrective action, the task force responsibilities were modified. By reference 6, the task force was assigned to evaluate the nuclear safety implications had the condition identified by Black and Veatch and their generic examples not been detected and corrected. It should be noted that determination of licenseability of any portion of the as-found or as-left facility remained outside the scope of the task force effort.

It was first presumed that the subset of problems for which a nuclear safety determination was required was those Black and Veatch findings and their generic examples which represented undetected deviations from the licensing bases at the time of the independent review. The identification of these deviations used the same screening process and grouping described in Section IV. This screening identified 7 categories of findings which represented undetected deviations from the licensing bases (categories 4(2), 11, 14, 23, 30(2), 35, and 37). For the generic deviations within these categories, the task force requested the performance of failure and/or safety evaluations. The implications to nuclear safety were considered to have been acceptable if either:

- o a failure evaluation concluded that the adverse effect of the deviation would not have resulted in any equipment failure under any design conditions which are part of the licensing bases, or
- o a safety evaluation concluded that the failure of equipment affected by the deviation would not have prevented the performance of any nuclear safety function which is a part of the licensing bases.

#### B. Results

A summary of the failure evaluations and safety evaluations of the deviations from the licensing bases within categories 4(2), 11, 14, 23, 30(2), 35, and 37 is provided in Appendix D.

The task force reviewed these evaluations and concluded the following with respect to the deviations from licensing commitments identified by Black and Veatch and their generic examples in the completed work of other Watts Bar systems:

o These deviations would not have prevented the performance of any nuclear safety function which is part of the licensing bases.

#### VI. SUMMARY

The objective of the task force effort was to evaluate the independent design review results in order to identify: appropriate corrective action plans, and the nuclear safety significance had these deviations not been corrected. Areas outside the scope of task force effort and this report included:
the adequacy of results and findings achieved through implementation of
corrective action plans and, the licensability of any portion of the Watts
Bar facility.

Upon completion of the evaluation process, the task force was able to draw conclusions with respect to the deviations from licensing commitments identified by Black and Veatch and their generic examples in the completed work of other Watts Bar system. The conclusions were:

- o Effective implementation of approved corrective action plans will bring these deviations in completed work up to a baseline of acceptability with respect to the licensing bases,
- o Effective implementation of approved corrective action plans will improve the achievement and maintenance of a baseline of acceptability in the future performance of similar work,
- o These deviations would not have prevented the performance of any nuclear safety function which is a part of the licensing bases.

#### CATROCKY

- 1. Findings which do not require evaluation for determination of corrective action.
  - 1(1) Findings for which BAV and TVA consider there to be so deviation. Information subsequently given by TVA recolved BAV finding (R) and represented a TVA position that no deviation existed with respect to licensing or internal consistents.

Exember

- FIM Lock of test data for flame test of cable. TVA subsequently provided BAV with existing cable flame test recults-
- "7302 TRIPE computer program not described in FAAR, TVA subsequently provided BAY with existing licensing submittal letter to MMC.
- 1(2) MAV identified deviation from final design or construction requirements for which TVA has determined work to be incomplete, the COMST accountability system and/or an OEDC deviation control system must have identified the remaining work prior to BAF identification.

Examples

- 7357 Restraint modeled for rigid restraint in vertical direction while designed support restrains in amial/lateral directions. TVA response Ongoing corrective action for this deviation was incomplete under ECH 3196 and ECH 2576.
- 9700 Hanger not installed. TVA response Incomplete construction status was correctly reflected under accountability preram NRM QCI-1.40.
- 1(3) B&V findings which require further review to determine whether a deviation existed. OEDC disagrees with B&V identification of a deviation. Upon completion of review, all these findings must be assigned to emother appropriate category.
- 1(4) Slack and Vestch findings which are identified "confirmed" or "open" and for which the TVA position is that the functional bases of the licensing application are satisfied.
  - Example: 7503-84V stated that input and output to computer programs should be listed in order to provide hard evidence that input time-histories are same as used in PSAR.

TVA's authors provided for reading time histories from private desk files with trecesbility accomplished through desh file asses, tape numbers used for input and output and internal checks of the computer calculations.

Task Porce Conclusion: Pinding 7503 is not a deviation. Although MAY's recommended approach is relatively conier to follow, the TVA method is fully suditable and therefore catiefies the licensing bases. Therefore the TVA approach is adequate.

7763 - B4V identified a support containing a susy atrut which appeared to have exceeding pin to pin misalignment. Total misalignment was based on measurements taken by B6V inspectors. Concern use stated that binding of pinned may atrut could secur.

Test Force Graciusion: Based on field uncouriments taken by Construction Field Ingineers on April 20, 1983, etrut miseligement falls within +6° eligement telerance as required by TVA General Construction Spec 0-43. MeV's use of a construct surface on a reference line for measuring strut miseligement accounts for differing task force constructor.

He further action is required.

2. This category has been eliminated and all findings placed in other estegories.

- 3. Logic/control drawings do not agree with electrical drawings NCB MBHBMP8267.
- 4. Failure to design/meintain design records as apocifically described in PSAR HCMs CENCEDS213, CENCEDS213, CENCEDS213, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENCEDS215, CENC
- 5. Procurement forms and flow diagrams specified different requirements for verieus velves 80hs 484828287.
- Discrepancies between design documents (analysis results, lead tables, isometric drawings, flow diagrams, etc.) used in the design of piping systems - BCRs MSHCESS232, MSHCESS233, MSHCMF8272, MSHCMF8305, MSHCMF8305, MSHCMF8312, MSHCMF8262.
- 7. Monconforming conditions in construction of proviously inspected and accepted pipe supports MCNo 4454R (R1), 4455R (R0), 4464R (R0), 4455R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0), 4464R (R0),
- 8. This item has been resssigned to Note 4.
- 9. Failure to adequately control and evaluate embedded plate especity when multiple attachments were made to the plate by Construction BCB WENCESS203.
- 10. This item has been recogigned to Note 7.
- 11. Inadequate documentation of operational modes date used in the analyses of piping systems NOR MERCENS215.
- 12. Failure by EN SES and COMST to properly implement and document the alternate analysis criteria for esistically supported piping MCNo MONOMORISE, MENCESSE231, 4164 R.
- 13. Termination information on the documentation was in error and was not updated to reflect the actual configuration NCR 4542R.
- 14. Various supports on the ATV systems have not been modified, redesigned, or initially designed per syrised analysis of ECH 2576 ECR MEMBERSEL RI.
- 15. This item has been resestaned to Note 4.
- 16. This item has been recoggned to Note 6.
- 17. This item has been resesioned to Note 7.
- 18. A technical note on a piping support drawing (47A050-17 Note 3) was found to be invalid for some applications MCR MRMRP\$273.
- 19. Equipment connot be determined to be environmentally qualified to NURRO-0548 NCMs unmarrally, unmarrally,
- 20. He precedure for documenting time delay relay settings that are determined by presperational tests and the presperational test did not identify or require the determining of these settings NCR NAMESSEES.
- 21. This item has been recoglaned to Note 4.
- 22. This item has been recorigued to Note 32.
- 23. The entitlery feed pump turbine trip and throttle velve POV-1-51 is not included in the active valve list. The design of the valve exhaustic descent include the required control room bypass and test indication, nor automatic bypass of the "open" torque suitab HCR MRHHREEZPO.
- 24. This item has been resestaned to Mate 19.
- 25. Florge evaluations were emitted in some analysis saleulations NCR WHNCH38222 R1.

- 26. These items have been reconigned to Hote 6.
- 27. This item has been reconigned to Note 4.
- 28. This item has been reassigned to Note 6.
- 29. This item has been split and resesigned to Notes 7 and 12.
- 30. Failure to satisfy design eriteria for conitoring 1) operability and 2) providing edequate electrical protective devices for the meter-d
- 31. Editorial discrepancies in licensing documents.
- 32. Incompatible honger drawings and piping isometries MCR MARKATSAN.
- 33. Inadequate cable tagging.
- 34. "Out of function" feature of a drawing was not in agreement with the lastest design drawing the detailed design of the "out of function"
- 35. Instantaneous trip setting for meter-operated velve breakers is not in accordance with SH MES criteria and vendor recommendations.
- 36. The cable tray fill eritoria (PAR section 8.3.1.4.3) is not assured of being not because of the loss than seasorvetive namical values used for
- 37. Valve wiring circuits are designed such that the red and green indicating lights on the unit control board will light dialy upon unlimetion of
- 38. Evaluation to determine if design of thermal overload bypass circuits unt requirements of counitments to 88 1.106 and ERRE 279-1971.
- 39. The specific configuration of 6.9-hV bundled cables in trays has not been tested for the effects of fire retardent conting on the empacity of the

| 32         | Incompatible hanger drawings and piping isometrics.                                                                                                                                                                                              | 7753, 7858, <b>7865, 7866, 79</b> 32,<br><b>7939, 7942, 7976, 7983</b> |
| 33         | Inadequate cable tagging.                                                                                                                                                                                                                        | <b>78</b> 07, <b>78</b> 09                                             |
| 34         | "Out of function" feature of a drawing was<br>not in agreement with the latest design<br>drawing showing the detailed design of the<br>"out of function" feature.                                                                                | F857, F910, F982, F984, F985,<br>F986, F987, F988, F989, F992,<br>F993 |
| 35         | Instantaneous trip setting for motor-operated valve breakers is not in accordance with EM DES criteria and vendor recommendations.                                                                                                               | F137                                                                   |
| 36         | The cable tray fill criteria (PSAR section 8.3.1.4.5) is not assured of being met because of the less than conservative nominal values used for cable cross sectional areas in the cable routing program.                                        | <b>7135</b>                                                            |
| 37         | Valve wiring circuits are designed such that<br>the red and green indicating lights on the unit<br>control board will light dimly upon malfunction<br>of the P-auto contact of the Westinghouse W-2<br>control switch on the unit control board. | F112                                                                   |
|            | Evaluation to determine if design of thermal overload bypass circuits met requirements of commitments to RG 1.106 and IEEE 279-1971.                                                                                                             | F108, F122                                                             |
|            | The specific configuration of 6.9-kV bundled cables in trays has not been tested for the effects of fire retardant coating on the ampacity of the cable.                                                                                         | G901                                                                   |

### APPENDIX A

## TASK FORCE MEMBERS

## This task force consisted of:

- H. L. Jones, Staff Specialist, Nuclear Engineering Support Branch, and OEDC Project Manager for the Black and Veatch Review (Chairman)
- E. H. Cole, Assistant to the Watts Bar Design Project Manager
- D. R. Denton, Principal Civil Engineer, Civil Engineering Support Branch
- J. A. McDonald, Chief, Quality Improvement Staff, Office of Quality Assurance and former NRC Resident Inspector at Watts Bar
- R. W. Olson, Principal Construction Engineer, Watts Bar Muclear Plant
- R. C. McKay, Supervisor, 79-14 Program, Watts Bar Muclear Plant (Replaced R. W. Olson on March 9, 1983).

### APPENDIX 3

### GUIDELINES FOR COMPLETING EVALUATION

## Evaluation Step

1. The task force evaluated all 428 B6V findings to determine whether a deviation existed with respect to either TVA's licensing or internal commitments for design, construction, or operation. (It is recognized that operations preparedness was not specifically reviewed; however, indicators of deviations with respect to these commitments must be evaluated.) Categories were designated for individual findings or groups of similar findings that required further review.

Designations used for findings when evaluations by task force determines that further review is not required will be:

- 1(1) TVA and B&V consider there to be no deviation.
- 1(2) B&V identified deviation from final design or construction requirements for which TVA has determined work to be incomplete. To be incomplete, the COMST accountability system and/or am OEDC deviation control system must have identified the remaining work prior to B&V identification.

Designation used when additional input is required:

- 1(3) B&V findings which require further review to determine if deviation existed since OEDC disagrees with B&V conclusion. Upon completion of this review, all of these findings must be assigned to one of the categories.
- The task force developed the category description and listed the related Black and Vestch findings.

#### HOTE

Subsequent to the initial screening and categorization of findings the task force initiates evaluation sheets and provides its "Preliminary" appraisal of the category and needed direction for evaluation and correction based upon the task force's objective knowledge and subjective impressions. The objective is to provide an initial direction for the development of a final TVA position on the category. The responsible organization assigned by the task force must develop from an objective basis a proposed "Final" TVA position for each step of the evaluation. At the point of task force concurrence, this represents the TVA position. The task force is responsible for developing and implementing a plan for resolution of any disagreements it may have with the responsible organization.

3. Evaluation for causes: The objective of this review is to develop a basis for a plan to identify, with reasonable assurance, all similar examples of the deviation elsewhere in TVA nuclear facilities beyond the scope of the BéV review. By virtue of the unique comprehensiveness of the BéV review, this objective may be satisfied by evaluation of

THE REPORT OF

finding groupings to determine the <u>most direct</u> control system (breakdown) cause that resulted in the deviations in engineering activity results.

Working upward in the <u>procedural</u> control system, this would typically be the highest level procedural control which was inadequate (i.e. EP, QCP level vs. PRH, QAPP, IDAP level). Working upward in the <u>performance</u> system this would typically be the highest level where performance or requirement for performance was inadequate (engineer, section, branch, or division level).

Typical examples of direct causes:

- The Engineering Support Branches did not require calculations to support all aspects of design in EP XXX.
- The section supervisors did not enforce the requirement for drawing compatibility.
- The engineer and checker did not follow the design change procedure.
- 4. Evaluation for generic examples: Based upon the cause(s) identified in 3 predict the potential scope of occurrence of deviations similar to those in the grouping.
  - (a) Review all work product within that scope to identify the generic examples.
- Licensing basis satisfaction: The licensing basis is not satisfied if the design or construction deviation may not be used-as-is to satisfy

the design, construction or operation commitments of the license application. All similar examples must be corrected to bring the plant up to a base line of acceptability for licensing. Future work control must be improved in order to maintain that base line of acceptability and support a TVA conclusion that the facility has been designed and constructed in accordance with the license application.

As deviations are identified on operational units the evaluation of licensing basis satisfaction should be transmitted by the responsible organization to the task force in terms of:

- the deviation(s) may be used-as-is because the safety margin remaining exceeds the licenising basis, or
- the deviation(s) reduce the safety margin to \_\_\_\_\_ which is less
  than the licensing basis of \_\_\_\_\_, or
- the deviation(s) result in failure prediction under license basis conditions, or
- the deviation(s) effect(s) have not yet been analyzed and are due to be determined by \_\_\_\_\_.

This notification does not replace required actions under the normal evaluation and licensing notification procedures.

6,7,8. Evaluation of Corrective Action for Completed Work: The objective is to select the most cost effective solution which will bring completed work up to a base line of acceptability. To that end the selected corrective action will be implemented through existing

OEDC management control systems. These automatically require as independent verification that the product satisfies specified requirements.

- 9,10. Corrective Action for Future Work: The objective is to select the most cost effective solution which will achieve and maintain a base line of acceptability, The selected corrective action will be implemented through existing OEDC management control systems.
  - 11. Implementation of corrective action for future work: The complete corrective implementation of actions to management control systems must be identified by the responsible organization to the task force.
  - 12. Verification of effectiveness of corrective action for future work:

    The sole purpose of corrective actions to management control

    systems is to improve the probability of achieving quality work.

    Therefore once corrective actions have been implemented the

    responsible organization should determine whether work activities

    being conducted under the revised control system are resulting in

    adequate quality achievement. If not, the corrective action must

    be revised and implemented. Additionally, work performed, under

    the original corrective action is suspect and deviations occurring

    since the last base line of acceptability must be identified and

    corrected.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 3/13/84

- 1. Task Force Category 3 for Watts Bar Huclear Plant Unit 1
- Task Force Category Description and Related B&V Findings:
   Logic/control drawings do not agree with electrical drawings:
   F101, F102, F103, F104, F105, F106, F107, F110, F111, F114, F115, F116, F117, F123, F124, F127, F129, F130, F131, F141, F802, F803, F804, F805, F806.
- 3. Evaluation for Cause
  - A. Preliminary
    - Inadequate drawing/checking of drawing prior to issue.
    - Inadequate recognition of need to revise companion drawings during design change process.
  - B. Final Failure to consistently implement design review procedures as required in EM DES engineering procedure EP 4.25, "Design Review and Interface Goordination of Detailed Construction and Procurement Drawings."

Resp. Org. Concere 3 V4/64 Task Force Concurrence W/ 3 W/84

- 4. Evaluation for Generic Examples
  - A. Preliminary

Problem is generic to logic, control, schematic, and connection drawings throughout WBN Unit 1.

B. Final - To determine generic implications, WBP reviewed the component cooling (70), containment spray (72), and residual heat removal systems (74) to identify mismatches in the logic, schematic, and connection diagrams for those systems. WBP then evaluated the seriousness and important of each mismatch and of the aggregate. Based upon this review, WBP concluded that the present TVA design for all safety systems is fully adequate for correct installation and operation of Watts Bar Nuclear Plant, with two exceptions: (1) instantaneous trip settings of molded case circuit breakers, (2) functional errors on logic diagrams.

See Continuation Sheet (page 7).

Resp. Org. anapp 3 19104 Task Force Concurrence 1/2 318184

- 3. Licensing Basis Satisfaction
  - A. Preliminary

Not satisfied for safety systems identified in FSAR section 7. Satisfied for all other systems.

B. Final - FSAR Section 7 identifies functional safety requirements for all safety systems. The licensing bases was not violated for any of the identified Black and Veatch findings in this category. However, the expended, three system review described in Section 4 revealed licensing problems in two areas: (1) licensing basis was not satisfied for instantaneous ttripecttings for molded case circuit breakers, (2) licensing commitments were not satisfied for logic diagram functional requirements.

Resp. Org. Grand 3 W164 Task Porce Concurrence 716 3 V6184

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

MCR SWP 8267 (currently nonsignificant) and ECN 3683 only address correction of B&V identified drawing errors in the auxiliary feedwater system. TVA's Level 1 response to B&V finding F101 does not address all the effects of the existence of inaccurate drawings during design, construction, and operation.

B. Final

No ongoing corrective action was in place at the time of the Black and Veatch review.

Resp. Org. ancarpy 3 14164 Task Force Concurrence 286184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

All safety system logic, control, schematic, and connection diagrams need to be reviewed and revised to be consistent with design criteria and each other. As discrepancies are corrected, the impact on internal safety analyses and previous licensing submittals must also be evaluated.

B. Final - WBP initiated the following ECNs to incorporate corrective actions for the findings identified in this category: 3647, 3650, 2816 and 3683. The following FCRs were also accepted from CONST: E3458 and E3508. Additionally, WBP initiated ECNs 4358 and 4360 to correct findings identified in the expanded, three safety review addressed in Section 4. ECN 4666 has been issued to correct logic diagram errors identified in the FSAR logic review, also described in Section 4, to be completed by march 30, 1984.

TVA Task Force for Review of Black & Veatch Findings

### BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

- 4. Evaluation of Generic Examples
  - B. Final (Continued)

WBP has previously addressed instantaneous trip settings on Black and Veatch category 35, including all generic examples and corrective actions. WBP is presently checking all logic diagrams contained in the WBMP FSAR against the appropriate schematic diagrams to identify any additional functional mismatches. This review will be completed by March 30, 1984.

APPENDIX C COMPLETED EVALUATION SHEETS TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R3 Date 37978

- 1. Task Force Category 4 for Watts Bar Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Failure to design/maintain design records for AFW system as specifically described in the FSAR: F118, F121, F303, F304, F305, F306, F309, F313, F502, F504, F511, F513.

- 3. Evaluation for Cause
  - A. Preliminary

The design control process was not closely linked to FSAR commitments.

B. Final - TVA personnel involved in the design process on Watts Bar were not (in all instances) aware of the statements in the FSAR that describe various aspects of the plant's design for which they were responsible. Subsequently, as the Watts Bar design (and concurrent design documentation) evolved, changes in TVA's design (both in design philosophy and physical layout) have not been uniformly reflected in the FSAR via mendments to the docketed description. This assessment is applicable to both units at Watts Bar.

Resp. Org. LHOhi 3/6/04 Task Force Concurrence 2/184

- 4. Evaluation for Generic Examples
  - A. Preliminary

Given the cause and the base of findings, the situation does not lend itself to a sample approach for bounding the problem to the AFW system.

B. Final - B&V findings in this category deal primarily with discrepancies in documentation (actual versus FSAR-described) on the civil engineering design aspects of the Watts Bar AFW system. However, the discrepancies do involve other engineering disciplines (besides civil) and are of a nature such that they could not be described as documentation problems associated only with the AFW system. Therefore, additional sampling of the FSAR statements would not provide an accurate assessment of the scope of discrepancies. This assessment is applicable to both units at Watts Bar.

Resp. Org. Holin 3 1/6/64 Task Force Concurrence 21/1 3/7/84

- 5. Licensing Basis Satisfaction
  - A. Preliminary

For all examples, licensing basis is not satisfied even though there may be no safety significance.

B. Final
Certain findings in this category—F303, F304, F305, F306, F309 and F313—(i.e., location of design documentation) would not impact the licensing basis for Watts Bar. However, other findings—F118, F121, F502, F504, F511 and F513—which involve the application of design/analysis techniques different from that described in the FSAR do not appear to satisfy the plant's licensing basis. This assessment is applicable to both units at Watts Bar.

Resp. Org. Ache: 316164 Task Porce Concurrence

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    Hemoranda NEB 821116 265 and NEB 830117 256 represent a valid FSAR correction
    process relative to assignment of scope, responsibilities, and timeliness. The
    criteria for the actual review are not identified and therefore cannot be
    determined to be effective in finding and correcting problems similar to those
    identified by B&V. The plan also needs to provide for accountability below the
    branch chief level.
  - B. Final

See continuation sheet (page 7)

Resp. Org. Library Task Force Concurrence 3 17184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 6AA should be issued in one document with clear criteria for assessment with respect to either a date or revision level applicable.

B. Final

See continuation sheet (page 7)

Resp. Org. LHahi 3/6/84 Task Force Concurrence 3/17/84

EN DES-SEP 83-05, "Verification of Information Presented in Final Safety Analysis Report for Watts Bar Nuclear Plant," was issued August 17, 1983 (NEB 830818 852). This SEP describes EN DES reponsibilities for performing a verification of the WBN FSAR to ensure accuracy of existing or completed work.

# 9A. Identification and Evaluation of Ongoing Corrective Action for Future Hork

A. Preliminary

Task force is not aware of any action currently directed toward this objective.

B. Final

See continuation sheet (page 7)

Rasp. Org. DTCLiff 5/2/83 Task Force Concurrence 25/5/83

## 10A. Identification of Corrective Action for Future Work

A. Preliminary

The design control process needs to be revised to provide a positive link to maintenance of an accurate FSAR.

B. Final

The actions described in section 9% provide the additional controls needed to more closely tie the design control process to the FSAR. This assessment is applicable to both units at Watts Bar.

TVA Task Porce for Review of Black & Veatch Findings

SLACE & VEATCE EVALUATION SHEET (Continuation Sheet)

64.

ladicological and the second

B. Criteria required for performing a formal review of existing FSAR material will be formally provided to the RH DES organizations responsible for validating the accuracy of this information. This criteria will be specific enough to identify discrepancies similar to the type found by Black and Veatch. Formal documentation of the review work will be required from the responsible organizations (BO); however, accountability below the branch chief/project manager level will not be required in the formal transmittal of new/revised FSAR material to the Reslect Engineering Support Branch's Muclear Licensing Section (MED-MLS). Each BO will be responsible for the level of review/accountability for their perticular FSAR sections. This assessment is applicable to both units at Wetts Ber.

74.

B. The memorandums referenced in section 6A will be superseded by the issuence of an EM DES special engineering procedure (SEP) which will identify (a) the current status (assument no.) of the FSAR, (b) a division of responsibility (DOR) for reviewing particular FSAR sections to verify present information and/or update as required, (c) criteria to be utilized by the RO in performing this review, and (d) dates for (i) completion of the FSAR review (ii) submittal of formal verification of existing FSAR material accuracy and new/revised FSAR descriptions (reviewed and coordinated as required by EM DES-EP 2.01) to MES-MLS, and (iii) submittal of all new/revised FSAR material received by MES-MLS to POMER's Muclear Licensing Staff. This assessment is applicable to both units at Watts Bar.

94

- B. The following actions taken or to be taken provide the additional assurance required that the FSAR will be more closely linked with the design control process:
  - 1. The DOR for FSAR section being developed as part of the EN DES-SEP discussed in section 7AB will serve to make affected EN DES personnel sware of their responsibility to keep the FSAR section(s) for which they are responsible up to date. The DOR will be maintained in a current status by NES-HLS and updated as required to reflect changes in section responsibilities and/or organizational realignments.
  - 2. EN DES-EPs 2.01, 2.04, and 2.05 are being consolidated into one EP to clarify the FSAR preparation/revision process within EN DES. When the revised EP is issued, the affected EN DES organizations will be formally notified and concurrently requested to emphasize to their employees the importance of compliance with the procedure.
  - 3. EN DES-EP 4.02 has been revised to require (a) the preparation of data sheets which describe PSAR changes needed as a result of an engineering change notice (ECH) and (b) verification that all required PSAR changes have been sent to MES-HLS prior to reporting by EN DES that all design work on an ECH has been completed.

This assessment is applicable to both units at Watts Bar.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 12/27/8:

- 1. Task Force Category 5 for Watts Bar Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Procurement forms and flow diagrams specified different requirements for various valves: 1) F308, F314, F328, F894, F895, F896, F897; 2) F307; 3) F335, F336.

- 3. Evaluation for Cause
  - A. Preliminary 1) F308, F314, F328, F894, F895, F896, F897 The design change process requirements apparently did not require that a review of the adequacy of previous procurements be made and documented when design conditions were revised.
    2) F307 The drawing preparation process apparently lacks a definitive policy on the manner of presenting design and operating conditions on isometric and flow diagrams.
    3) F335, F336 The component qualification process results were not required to be simultaneously tied to the design process and procurement process.
  - B. Final 1) and 2) Our normal squadcheck and ECN process requires a review of all items affected by a design change for adequacy. Our flow and isometric diagrams list piping classifications and not actual operating pressure and temperature. Design conditions for the valves are calculated using operating temperatures and pressures. It was never intended that the valves be specified to flow diagram data. Also, misuse of the S1 ECN may have contributed to the discrepancies.

    3) As above.

Resp. Org. 70 RB sluc / 19/84 Task Force Concurrence

119183 24

- 4. Evaluation for Generic Examples
  - A. Preliminary The generic examples could be identified by: 1) F308, F314, F328, F894, F895, F896, F897 Review all safety related EEB procured valves where system design pressure/temperature conditions have changed since procurements to verify consistency of procurement documentation. 2) F307 A review of all interfaces of low pressure, normally idle systems with high pressure normally operating systems for the adequate presentation of design and operating conditions. 3) F335, F336 The examples noted by B&V represented slow documentation of qualification rather than nonperformance of the qualification. Since this was ongoing incomplete work there is no need to identify generic examples. (However, the program control does need some improvement see 10A.)
  - B. Final 1) All EEB procured valves were compared to new design pressure/ temperature conditions using AMSI class rating and no discrepancies were found.
    2) A review of all interfaces was performed and no discrepancies were found.
    3) As above.

Resp. Org. MR Reluc 1/9/84 Task Force Concurrence 28/1-1/9/84

### 5. Licensing Basis Satisfaction

### A. Preliminary

1) and 2) All examples identified thusfar are acceptable to use-as-is. However, both types of problem have the potential for resulting in a failure to meet the licensing basis. Therefore, this determination can not be made until the generic examples are identified. 3) N/A - This work was in progress.

#### B. Finel

1) and 2) All valves and interfaces were checked and found to satisfy the licensing basis. 3)  ${\rm H}/{\rm A}$ 

Resp. Org. M. R. Reluc 1/9/84 Task Force Concurrence 1/1/84

## 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

#### A. Preliminary

1) and 2) WBNEKB 8207 and ECN 3511 address the B&V findings with the following exceptions: F308 and F314. The Task Force is not aware of any corrective actions yet specified.

B. Final

H/A

Resp. Org. M R Believe / 19/84 Task Force Concurrence 1/9/84

### 7A. Identification of Corrective Action for Completed Work

#### A. Preliminary

1) The generic deviations identified in 4 should be requalified to the current design conditions. 2) The flow diagrams should be revised to accurately and consistently present the design information. 3) N/A - No deviations in completed work were substantiated.

B. Final

N/A

Besp. Org. MR Belev 1 19 184 Task Force Concurrence 24 119184

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

1), 2), and 3) Task Force is not aware of any action.

B. Final

N/A

Resp. Org. MR Below 1/7/84 Task Force Concurrence 1/9/84

10A. Identification of Corrective Action for Future Work

A. Preliminary

1) Policy needs to be established for positive reassessment of procurement affected by design changes. 2) Drawing presentation of design conditions needs to be better specified. 3) The process of requalifying components whose seismic accelerations are analysed to exceed procurement specifications needs to be formalised and included in the EP system.

B. Final

The engineering procedures in place (ECN, squadchecking, signature, further review) are adequate to prevent recurrence. EP 4.02 has been revised and a memorandum issued by menagement, controlling the use of the SI ECN. EP 5.06 has been issued (5-27-80) to control preparation and review of specifications. Together these steps should avoid the concerns identified in step 3A.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

R3 3/13/84

- 1. Task Force Category 6 for Watts Bar Nuclear Plant Unit 1
- Task Force Category Description and Related B&V Findings: Discrepancies between design documents (analysis results, load tables, isometric drawings, design drawings, etc.) used in the design of piping systems: F310, F319, F324, F325, F346, F751, F868.
- 3. Evaluation for Cause
  - A. Preliminary
    - (1) Regarding findings (F319, F324, F325, F346) the cause stems from ineffective handling of interfaces between two analysis (i.e., lap zones). (2) The remaining findings appear from the initial evaluation to be random errors in the design verification process with no uniquely definable cause.
  - Whit unit 1: Regarding findings F319, F324, F325, and F346 the cause stems from:
    (la) ineffective handling of the interface region between two analyses and (lb)
    errors related to the use of the -ANCHOR program. (2) The remaining findings
    were determined to be random individual errors in the design process with no
    uniquely identifiable cause. The errors if uncorrected would not result in a
    failure of the piping pressure boundary or loss of system function. No additional
    evaluation is required.

Resp. Org. 72 Grant 3/15/84 Task Force Concurrence 21/1 3 V6/84

- 4. Evaluation for Generic Examples
  - A. Preliminary
    - (1) The scope of the evaluation for generic examples should include a review of all lap zones in Watts Bar unit 1. (2) The determination of generic examples will be made after the cause and effects of the individual findings are evaluated.
  - B. Final (1a, 1b) The scope of the evaluation for generic examples should include a review of all rigorous analyzed lap zones and anchors (effected by the -ANCHOR program) in WBM unit 1. (2) No further evaluation is required, see 3.B.(2) above.

(la, lb) The review has been completed. Thirty-two problems were identified requiring revision due to lapping deficiencies. All skewed anchors which were analyzed using the direction cosine option in question will be reanalyzed.

Resp. Org. 72 Grand 9/15/84 Task Force Concurrence 3/4/84

- 5. Licensing Basis Satisfaction
  - A. Preliminary
    - (1) The licensing bases for these findings are not satisfied. (2) The determination of whether or not the licensing basis for the remaining findings are satisfied will be made after the findings are evaluated.
  - 5. Final (la, lb) The licensing basis for these findings is not satisfied. (2) Licensing basis is satisfied.

Resp. Org. 72 Coming 3/15/87 Task Force Concurrence 2/ 3 VL/84

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary (1) USHRC NUREG/CR-1980 addresses lapping in piping analyses. Also corrective action is in progress in response to unresolved Item 390/82-27-09 per NRC letter D.M. Verrelli to H. G. Parris dated September 10, 1982 and NCR's WBNCEB 8233, WBMSWP 8309, WBNSWP 8312, WBNCEB 8232. This appears to be an adequate approach but the task force has not fully evaluated the corrective actions. (2) No generic corrective action is identified for this group of findings.
  - B. Final

    (1a) MCRs WBMCEB8233, WBMSWP8309, WBMSWP8312, and WBMCEB8232 specifically address the findings and cause. All lapped regions are being reviewed and corrections are being made to piping analysis and support design as required. Unresolved item 390/82-27-09 is being investigated and the correctness of the WBM lapping techniques is being verified. Criteria has been issued in the rigorous analysis handbook. This correction is judged adequate. (See Continuation Sheet, page 7.)

    Resp. Org. 72 (184)
- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary
    (1) Resolve differences in lap zones analyses and results and any designs resulting therefrom. (2) All findings not identified in 3.A.1 shall be evaluated to determine whether or not the affected piping systems will fail (loss of function) if the conditions found by B&V were not corrected. This information will be used to determine if identification of other generic examples are required.
  - The plan in 6A.B. appears adequate.

B. Final

Resp. Org. 72 Comin 3/15/ Task Force Concurrence 3/16/84

| 84. | Implementation | and Inspection | of Corrective | Action fo | or Completed Work |
|-----|----------------|----------------|---------------|-----------|-------------------|

A. Preliminary

B. Final
(1a) All piping analysis work is complete. A total of 32 problems were revised (12 of these were reanalysed). The WBM lapping criteria has been verified by EDS (IMPELL) as being correct. Remaining design work is being tracked through NCEs WBMCEB8233, WBMSWP8309, WBMSWP8312 and WBMCEB8232. (1b) All piping analysis work is complete. All affected anchor load tables have been reissued. Remaining design work

is being tracked through MCR GEMCEB8302(R1). (2) Deviation corrected if appropriate.

Resp. Org. Ramm. 3/15/17 Task Force Concurrence

## 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary (1) USHRC NUREG/CR-1980 addresses lapping in piping analyses. Also corrective action is in progress in response to unresolved Item 390/82-27-09 per NEC letter D.M. Verrelli to H. G. Parris dated September 10, 1982 and NGR's WHNCEB 8233, WHNSWP 8309, WHNSWP 8312, WHNCEB 8232. This appears to be an adequate approach but the task force has not fully evaluated the corrective actions. (2) No corrective action has been identified for this group of findings.

B. Final
(1a) As discussed in 6A.B the lapping criteria has been issued in the rigorous analysis handbook. (1b) As discussed in 6A.B the -ANCHOR program has been modified, the output has been modified, and the owners manual has been modified.
(2) No further corrective action is required.

Resp. Org. Teleman 3/10/84 Task Force Concurrence 21/6 3 V6/84

10A. Identification of Corrective Action for Future Work

A. Preliminary

B. Final

The action identified in 9A.B appears to be adequate.

TVA Task Force for Review of Black & Veatch Findings

BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

B. Final - continued

(1b) MCR GENCEB8302 Rl specifically addresses this cause. The -ANCHOR program has been modified, the output has been modified, and the users manual has been modified to reflect these changes. All skewed anchors which were analyzed using the direction cosine option in question will be reanalyzed. Anchor loads will be compared to the previous design loads, and anchors will be redesigned as needed. This correction is judged adequate. (2) These were random individual errors and no further corrective action is required.

TVA Task Force for Moview of Black & Testch Findings

EVALUATION SHEET

- 1. Task Force Category 7 for Matts Bar Muclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings: Monconforming conditions in construction of previously inspected and accepted pipe supports: 7367, 7704, 7718, 7719, 7726, 7734, 7736, 7737, 7749, 7772, 1773, 1774, 1776, 1819, 1884, 1919, and 1920.
- 3. Evaluation for Cause
  - A. Preliminary
    - -On ones involving parts removed after final inspection cause unknown.
    - -On cases involving missing welds and members different than drawing oversight.
    - -On ones involving clearance and out of tolerance cause unknown.
  - B. Final
    - -On ones involving parts removed after final inspection cause unknown.
    - -On ones involving missing welds and members different than drawing oversight.
    - -On ones involving clearance and out of tolerance Concur w/A except clearance and out of tolerance problems are usually oversights/additional unknown causes

Resp. Or Commist from 4/19/83 Task Force Concurrence 4/24 83

- 4. Evaluation for Generic Examples
  - A. Preliminary

It is assumed that these examples exist through all systems.

B. Final

These examples exist through all systems with one generic exception. Bergen-Paterson (B-P) drawing 6000-1 authorises the deletion of internal pipe side welds for box frames comprised of WF members only. The misapplication of this exemption is generic for only B-P drawings and not for TVA or EM DES drawings.

Resp. Org Chandel Chan 1/18/80 Task Force Concurrence

- 5. Licensing Basis Satisfaction
  - A. Preliminary

Hime of the 17 hangers did not satisfy the licensing basis.

B. Finel

Based on the premise that "use-as-is" disposition of MCRs will satisfy licensing basis, ten of the seventeen hangers will not satisfy it.

Resp. Or Sand Rom 4/8/83 Task Force Concurrence 4/5/ 53

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

Corrective action is 79-14 program Phase I as defined by WBH-QCP-4.56. Corrective action is adequate.

B. Final

Concur with 6.A.

Resp. Or January . Barn 4/18/63 Task Force Concurrence

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 6AA is adequate.

B. Final

Concur.

Resp. Org Choung filtre 4/18/13 Task Force Concurrence 2/1/83

- 84. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary

The implementation of NRC Bulletin OIE 79-14 is required prior to unit fuel loading. This requirement will ensure implementation and inspection of corrective action for completed work.

B. Finel

Concur.

Beep. Org. Thomas Raum Notes Force Concurrence De 1/1/8/83

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

It is ecceptable for TVA to continue with the progress in place and to follow up with the 79-14 progress.

B. Finel

Concur with 9.A. In addition we have corrected the misinterpretation of pipe side welds on B-P drawing through additional training of inspectors.

Resp. Or Flour Phone 4/1/83 Task Force Concurrence Defend 2/83

104. Identification of Corrective Action for Future Work

A. Preliminary

Same comment as 9AA above.

B. Final

Seme as 9A.B.

TVA Task Force for Review of Black & Vestch Findings

EVALUATION SHEET

Rev. R2 Date 1/24/8

- 1. Task Force Category 9 for Watts Bar Buclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Failure to adequately control and evaluate embedded plate capacity when multiple attachments were made to the plate by Construction: F506, F710, F711, F712, F713, F724R1, F730R1, F731R1

- 3. Evaluation for Cause
  - A. Preliminary
    - EN DES procedures did not control or address the addition of attachments to embedded plates by Construction.
    - Installation requirements and acceptance criteria on design output documents were not adequate (construction specifications and drawings).
  - B. Final

Same as Preliminary.

Resp. Org. WBP 7/20/83 Task Force Concurrence 24/83

- 4. Evaluation for Generic Examples
- A. Preliminary

This finding applies to all embedded plates.

B. Final

Same as Preliminary.

A. Joneson Task Force Concurrence 2 7 20/83

A. Joneson

- 5. Licensing Basis Satisfaction
  - A. Preliminary
    Licensing basis is satisfied thus far since the B&V findings and the sampling
    program performed to date has not identified any examples of embedded
    plates where failure would occur. Until the sampling program is
    completed, a potential exists for the licensing basis not being satisfied.
  - R. Finel

Licensing basis is satisfied since neither the B&V findings nor the sampling program identified any plates in the sample that were structurally inadequate.

Resp. Org. WBP 1/31/84
Attropic Concurrence 1/31/84
Attropic Concurrence 7/8/83

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    The corrective action for MCR WBM CRB 8203 is a sample of 69 embedded plates
    to evaluate if a failure would occur in a worst case situation. Based on the
    results of the sample, further corrective action may be required. This approach
    is adequate.
  - B. Final

The corrective action for NCR WBMCKB8203 to sample 69 embedded plates was completed. No further corrective action is required.

Resp. Org. WBP 7/20/83 Task Force Concurrence 7 Re/83

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 6AA appears to be adequate.

B. Final

Identification of corrective action for completed work is not required as all 69 sampled embedded plates were found to be structurally adequate.

As Resp. Org. W BP 7/20/83 Task Force Concurrence The 7R-/85

8A. Implementation and Inspection of Corrective Action for Completed Work

A. Preliminary

B. Pinel

No corrective action for completed work is required as all 69 sampled embedded plates were found to be structurally adequate.

A) Resp. Org. USP 7/20/83 Task Force Concurrence 2/20/83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary
Construction Specification for Watts Bar Huclear Plant H3C-928, "Locating
Attachments on Embedded Plates," provides requirements to Construction
for locating attachments on embedded plates. Hanger drawings should
reference this construction specification as required.
This plan appears to be adequate.

B. Final

Corrective action as described in A is adequate.

Al Resp. Org. WBP 7/20/83 Task Force Concurrence 2/6-7/2483

10A. Identification of Corrective Action for Future Work

A. Preliminary

Plan in 9AA appears adequate.

B. Final

Plan in 9A is adequate.

AJ Resp. Org. WBP 7/20/83 Task Force Concurrence 7/20/83

TVA Task Force for Review of Black & Vestch Findings

EVALUATION SHEET

Rev. <u>82</u> Date 12/27/83

- 1. Task Force Category 11 for Watts Bar Suclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Inadequate documentation of operational modes data used in the analyses of piping systems: F331 and F373.

- 3. Evaluation for Cause
  - A. Preliminary

Insufficient control of design information used in piping analysis for operating conditions.

B. Final

Same as 3.A.

Resp. Org. 72 faming 12 /57 /53 Task Force Concurrence

115184

- 4. Evaluation for Generic Examples
  - A. Preliminary

completed.

The findings suggest that other deviations may exist. The evaluation for generic examples should include a comparison of the operational modes design information contained in CEB report 76-2 with current design information for all safety-related piping systems.

B. Final
The findings suggest that other deviations may exist. A sample of piping problems will be reviewed as discussed in EN DES-SEP 82-15 (R1). This is a sample of all rigorously analyzed safety-related piping systems and includes portions of those operating modes contained in CEB report 76-2 and in other sources. The sampling program will be completed by 1/14/84. Only one problem has failed the sampling evaluation to date and only the Safety Injection System (SIS) remains to be

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

NCR WENCES 8215 and EN DES SEP 82-15 add-ass the findings. SEP 82-15 does not adequately address the generic implications referred to in 4A.

B. Final

MCR WBMCEB 8215 and EM DES SEP 82-15 address the findings. SEP 82-15 (R1) includes identification and evaluation of worst case affects with the provision that the sampling program can be expanded as needed. The proper corrective action will be determined when the sampling program is completed.

Resp. Org. Z. Grand R. H. 187 Task Force Concurrence William / 15 184

7A. Identification of Corrective Action for Completed Work

A. Preliminary

All deviations found in the comparison recommended in 4A must either be resolved by (1) resnalysis of the piping systems or (2) identification and analyses of worst case(s) to justify acceptability.

B. Final

The plan in 6A.B. appears adequate.

Resp. Org. Technic R/8/65 Task Force Concurrence Western / 15784

- 84. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final

The sample program is still in progress and will be completed by 1/14/84. The single problem that failed the evaluation has been reanalyzed. Only \$15 remains to be completed. This entire effort is being tracked through MCR MBMCES8215.

Resp. Org. 75 6 18 18 Task Force Concurrence 25/6 /15/84

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

Task force is not aware of ongoing corrective action for future work.

B. Final

There is no ongoing corrective action for future work.

Resp. Org. 72 Carrie 12/27 | Task Force Concurrence 2/15/84

10A. Identification of Corrective Action for Future Work

A. Preliminary

Programmatic correction is needed to: (1) document the control of operating condition design information and (2) improve adherence to these controls.

B. Final

In the short term, to improve documentation and control of operational modes, isometrics will be squadchecked early in the analysis to specifically confirm correct operating modes. The isometric op mode information will be clarified and updated as needed. In addition, the project system designer will inform the piping analysts in writing of any op mode change which has the potential of affecting analysis so that this effect can be reviewed. (This will be further reviewed for long-term corrective action when the WBH sampling program is completed.) See Continuation Sheet (page 7).

- 2. Failure to adequately train personnel.
- 3. Insdequate quality assurance Program.

### C. PECCHECENDATIONS

- \_SHP should set up a training program to ensure personnel
  assigned to perform alternate analysis are trained to the
  technical application of the criteria.
- 2. A procedure to document alternate analysis should be developed and include a verification check list and certification of compliance sheet for each alternate analysis package to ensure compliance with the requirements of the alternate analysis criteria (CES 76-5).
- Schedule and manpower commitments should provide enough time for the checkers to verify the adequacy of analysis.
- 4. A task force composed of piping designers, piping analysts, and pipe support designers should be formed in SWP to perform periodic internal audit to support QAB in the technical aspect of design.

### 3.0 AMALTTICAL TECHNIQUES

# A. WEARNESSES:

Same as documentation weaknesses before.

# B. ROOT CAUSE(S):

Same as documentation basic root cause before.

#### C. RECOMMENDATIONS:

- ise Alternate Analysis Criteria 76-5 to provide analytical model for locating seismic support which is applicable to many real-to-life situations.
- 2. Revise the 47A053 Series drawing notes to:
  - a. Include requirements for documentation of analysis, the qualification of equipment nossle loads, and effect of end point movements.
  - b. Consider effect of thermal expansion load on supports and suchors for a long, straight run of pipe where two or more in-line axial restraints are required or on supports at opposite ends of the bend where thermal movements exceed 1/16 inch.
  - c. Clarify technical terms used in the application of 47A053 and expand definition in terms of sketches or diagrams.
  - d. Provide example(s) which is/are applicable to many real situations.
- 3. Review and correct inadequacies of typical support drawings used for supports adjacent to tees and adjacent to bends when used as axial restraints of adjoining run, and as in-line axial restraints.
- 4. Form a task force to review and remove the conservation built in CER Report 76-5 after investigating and correcting adequacy of seismic support spacing and load generated based on the flexible side of the response spectra curve.

317+N5

#### 4.0 DESIGN DATA TRANSPER

### A. WEATTERES.

- Lack of quality assurance controls of design information
   (system designer analyst support designer procurement fabricator construction) for the following: valve data,
   insulation data, operating mode data, equipment data, response
   spectra.
- 2. Lack of quality assurance controls of software programs.

#### B. ROOT CAUSES

- 1. Inadequate exchange or coordination of needs and information between project to branch and branch to project.
- 2. All of the previous basic root causes identified.

# C. RECORDENDATIONS

- Recommend that EM DES EPs be developed and/or enforced that
  will assure that valve data, insulation data, equipment data,
  and response spectra data is quality assured information and
  is controlled from designer to erection.
- Recommend that piping analysis operating mode data drawings be developed, issued, and maintained.
- Recommend that all the data identified above be obtained and put into a data base file as soon as possible.
- 4. Recommend that the affect and cost of revisions to the above data be made known to the organizations responsible. The revisions must be stopped. The cost due to a delay in fuel loading because of revision causing reanalysis is generally

far more than the cost of special replacement hardware orders of identical items and/or the cost of resnalysis itself.

- Recommend that all software computer programs have a quality assured verification, authorization, and notification program administered.
- Recommend that the above data transfer recommendations be given top priority of implementation and completion.

# 5.0 ORGANIZATIONAL EFFECTIVENESS

### A. WEARNESSES:

- Lack of communication and coordination between SWP, CEB, and COMST.
- 2. Lack of training within CEB, SWP and COMST.
- 3. Inadequate analysis result.

# B. ROOT CAUSES:

- Division of Construction, not sufficiently trained to perform design work, was given the full responsibility by SWP to perform design work without EM DES supervision (review and approval of construction analysis work).
- 2. SWP mechanical sections responsible for alternate analysis (system engineers and support designers) are not sufficiently trained to do alternate analysis work; therefore, quality product is not assured.
- CEB failed to provide SWP sufficient training and guidance to implement the use of the Alternate Analysis Criteria 76-5 developed by EDS.

- 4. CRB has not reviewed in detail the technical requirements, limitations, and practical application of the criteria before issuing to SNP for use.
- CES not responsive to SNP's need to make deviation to the criteria for reason that CES has to get EDS approval.
- CES (the lead organization) failed to andit SWP's analysis to ensure compliance with the requirements of the criteria.
- 7. SWP failed to provide sufficient training to construction in the application of 47A053 notes.

### 6.0 RECORDENDATION

- Analysis performed by construction must be reviewed and approved by EM DES.
- Form a section (alternate analysis) in SNP similar to MLP and TCP to handle the following:
  - Resnalyse and document all alternate analysis problems in question.
  - b. Review and approve all variances to the alternate enalysis.
  - c. Review and approve all application of 47A053 notes performed by Construction.
  - d. Develop project procedures and guidelines in response to higher level branch criteria as needed.
  - e. Develop a training program for SWP and Construction analysts. (SWP, CEB, and Construction management personnel responsible for approving analysis will participate in the training program.)

4. L. E1:

-1-

A62173.20

#### V. ROOT CAUSES

After review of all NCR's and evaluation of the the sample packages, the following root causes of the problem seen in the WBN alternate analysis program have been identified.

- 1. Lack of Experienced Personnel: Most of these analyses have been conducted by SWP mechanical personnel who were familiar with piping system and pipe support design, but with little piping analysis experience.
- 2. Failure to Adequately Train Personnel:
  Very few SWP engineers or designers have been trained in piping analysis. Some people have been trained in TPIPE, which is a computer method used in rigorous analysis by CEB, but none have used the training at SWP. There has also been no effective effort to train people in alternate analysis.
- A good procedure could have partially compensated for the lack of experienced and trained personnel, but as identified in NCR WBNSWP8220, SWP did not have a procedure for alternate analysis.
- 4. Schedule Pressures: Pressures to meet commitments for issuing support drawings to Construction may have contributed to the lack of emphasis on control of alternate analysis.
- 5. Criteria Inadequate and not Maintained: As discussed in section III.B. of this report, the criteria used for analysis was lacking in several areas. A continuing effort should have been made to correct problems and reduce conservations.

6. Poor Coordination Between CEB, SWP, and CONST:
If CEB, SWP, and CONST had worked more closely, problems could have been recognized sooner and resolved.

# VI. RECOMMENDATIONS

After consideration of the findings discussed above, the WBM Alternate

Analysis Review Team makes the following recommendations to correct the

discrepancies found:

### . A. Procedures and Criteria

- 1. SWP, in coordination with CEB and QAB, should write and issue a procedure for performing and documenting alternate analysis. ~
  If an adequate procedure had been in place earlier, many documentation and technical discrepancies could have been avoided.
  Due to the large amount of analysis already performed, this procedure should also identify the minimum amount of rework or documentation needed to meet the criteria requirements.
- 2. Concurrently with the development of the analysis procedure, CEB report CEB-76-5 should be revised to correct technical problems and remove unnecessary conservations so that excessive rework can be avoided. Where possible, sections of the report issling with brancher, task, benue, valvas, small supports, support loads, and thermal flexibility should be revised to give less conservative rules. A procedure for evaluating flanges should be incorporated to resolve NCR WBNCEB8218. Other reports and drawings (i.e., CEB-75-9, 47A053, and other series drawings) used for alternate analysis should be reviewed and revised where necessary.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHREET

Rev. R1 Date 5/5/83

- 1. Task Force Category 13 for Watts Bar Muclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Termination information on the documentation was in error and was not updated to reflect the actual configuration: 7142.

- 3. Evaluation for Cause
  - A. Preliminary

The example was an oversight and it is felt it is an isolated case.

B. Final
Finding F142 was an oversight and was an isolated case. A sample of 51
AFW termination records were evaluated to confirm that this finding was
an isolated case. The sample contained 31 records involving the inspector
and/or engineer on B&V finding F142 and 20 records involving others. The
terminations identified on these records were compared to the termination
diagrams. There were no errors identified on any of these records. Therefore finding F142 was an isolated case.

Resp. Org. Edburg 4/18/83 Task Force Concurrence 4/20/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

To confirm that the example was isolated, the following sample should be evaluated: Compare 40 AFW termination records to the termination diagrams. The sample should contain 20 records involving the inspector and engineer on B&V finding F-142 and 20 records involving others.

B. Final

The sampling has been completed. This finding is not considered to be generic because there were no errors identified on any of these records. Finding F142 is an isolated case.

Resp. Org. Ed Bush 41883 Task Force Concurrence 216 4 20183

| <b>`8</b> . | Licensing  | Books: |         |       |
|-------------|------------|--------|---------|-------|
| J.          | TTCCTT INT | 14618  | MARIARA | etion |

A. Preliminary

The example identified thus far satisfied the licensing basis.

Outil-sampling is completed, a potential exists for the licensing basis not being satisfied.

B. Final

The sampling has been completed and no errors were identified. Therefore the licensing basis is satisfied.

No further action is required.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R1 Date 12/22/83

- 1. Task Porce Category 14 for Watts Bar Nuclear Plant Unit 1
- Task Force Category Description and Related B&V Findings:
   Various supports on the AFW system have not been modified, redesigned, or initially designed per the revised analysis of ECM 2576: #369, #371, #756, #767, #783, #784, #788, #794, #845, #853, #855, #899, F911, #949, F950, #951, F955, #958, F963, #964, F965, and #821.
- 3. Evaluation for Cause
  - A. Preliminary

    An ineffective tracking of work progress under CEB 81-30. SWP's tracking of the status of ECN 2576 provided the inaccurate conclusion that unit 1 work was completed. No formal controls were required for ECNs which required many work items over a relatively long period of time and for which responsibility was transferred between supervisors.
  - B. Final

An ineffective tracking of work done per CEB-81-30 under ECN 2576. SWP's tracking of ECN 2576 provided the inaccurate conclusion that all hanger work for unit 1 was complete. There were no formal controls to track the many work items done over a relatively long period of time and for which responsibility was transferred between supervisors during the SWP reorganization.

Resp. Org. MOof 1/3/84 Task Force Concurrence

28/\_\_15184

- 4. Evaluation for Generic Examples
  - A. Preliminary

Since all unit I hangers were covered by ECN 2576, a complete review of work under ECN 2576 is needed to identify generic examples in rigorous analysis. A sample of one relatively large ECN outside the scope of AFW should be conducted to confirm the scope of that ECN was implemented.

B. Finel

Since all unit 1 hangers were covered by ECN 2576, a complete review of work done under ECN 2576 was performed. In addition ECN 3184 was reviewed to ensure that the scope of that ECN was implemented. It has been concluded per these reviews that this is a unique case and not generic to the ECN process. See attached memo to Files dated 12/14/83 (WBP 831214 001).

| 5. | Licensi | no Res | is ter | isfaction |
|----|---------|--------|--------|-----------|
| •  | PTCAMAT |        | 18 365 | LSISCEION |

A. Preliminary

In some examples hangers did not get revised, resulting in the licensing basis not being satisfied.

B. Final Hanger discrepancies identified by Black & Veatch were not incorporated on numerous hanger drawings per ECH 2576, resulting in the licensing basis not being satisfied. These discrepancies have been handled under ECH 3511 to satisfy the licensing basis for AFW. All discrepancies found per the review made in step 4.8 will be completed under ECH 4080 by 12/30/83 to satisfy the licensing basis for

Resp. Org. 1 7006 1 /3/84 Task Force Concurrence

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

WBH SWP 8301 and ECN 3511 have been initiated. They are limited in scope to the B&V findings on the auxiliary feedwater system and do not yet prescribe a corrective action.

B. Final

HCR WBHSWP8301 was written against B&V findings on the sumiliary feedwater system. All changes required on sumiliary feedwater supports have been made under ECH 3511. All systems have been reviewed for implementation of ECH 2576 and ECH 3184. Any discrepancies found per this review will be resolved under ECH 4080.

Resp. Org JA Mod 1/3/84 Task Force Concurrence 15/84

7A. Identification of Corrective Action for Completed Work

A. Preliminary

Need to complete ECN 2576 for all systems.

B. Final

All discrepancies found per the review of all systems for ECH 2576 and ECH 3184 will be completed per the disposition of MCR WBNSWP8301 under ECH 4080 by 12/30/83.

10A. Identification of Corrective Action for Puture Work

A. Preliminary

Criteria need to be established for the identification of need for employment of tracking systems, as well as for implementing them. This criteria should be linked to the establishment of SEPs.

B. Final

all future ECMs on WBP will be written for a single unit only, therefore, eliminating much of the problem that occurred with ECM 2576. To prevent recurrence the review of analysis isometrics and load tables per the scope of the ECM have been upgraded to formal calculation packages requiring appropriate documentation. This upgrading and documentation per the scope of the ECM are requirements that have been incorporated into WBP-EP 43.14.

SUBJECT: WATTS BAR NUCLEAR PLANT UNIT 1 - DOCUMENTATION SUMMARY FOR BLACK AND VEATCH

TASK FORCE CATEGORY 14 COMMITMENT ASSOCIATED WITH NCR WBMSWP8301

#### Synopsis

The Watts Bar Design mechanical group commitment to review ECN 2576 and one other relatively large ECN for Black and Veatch Task Force Category 14 is complete. The following detailed summary presents the overall results of this review. The summary will show that 92 percent of approximately 5,000 suports reviewed for ECN 2576 were found to require no change. Of the remaining eight percent, one-tenth percent required construction rework and the remaining seven and nine-tenths percent required only documentation changes. The summary will also show that 99 and nine-tenths percent of approximately 435 supports reviewed for ECN 3184 were found to require no change. The remaining one-tenth of a percent required minor construction rework such as adding a shim plate to improve the bearing surface for the pipe lug.

We feel that the review for ECN 3184 shows that the ECN was implemented correctly and the oversights found in the review for ECN 2576 were not generic.

#### Summary

The following summary has been prepared as a followup to our commitment to the Black and Veatch Task Force to perform a complete review of the work under ECN 2576 and one relatively large ECN outside the scope of the auxiliary feedwater system. The ECN chosen for the additional review was ECN 3184. This ECN required the review of all axial pipe supports with lugs bearing against structural tube steel due to the lack of consideration given for the radiused corners on the tube steel. This problem has the potential of overstressing the pipe wall and allowing more axial movement than the piping analysis allows.

The approach taken for ECN 2576-was to review all unit 1 rigorously analyzed support designs (approximately 5,000) against the current analysis and identify all discrepancies. For ECN 3184, all unit 1 axial support designs with lugs bearing against structural tube steel (approximately 435) were reviewed to determine if any overstressed conditions existed or if any axial movement was allowed which exceeded the piping analysis requirements.

WATTS BAR MUCLEAR PLANT UNIT 1 - DOCUMENTATION SUMMARY FOR BLACK AND VEATCE TASK FORCE CATEGORY 14 COMMITMENT ASSOCIATED WITH NCR WENSWP8301

The review for EUNs 2576 and 3184 involved reviewing approximately 5,500 supports from both rigorously and alternately analyzed piping Systems. The results for both ECNs are as follows:

# ECN 2576

Of approximately 5,000 unit 1 supports reviewed against the scope of ECN 2576, 382 supports were found to require minor documentation changes and only six supports were found to require construction rework to meet the requirements of the latest analysis. The documentation changes were of a minor nature such as a location correction, a node point correction or a support type changed from a unidirectional to a rigid support which only affected the support drawing. The problems encountered with the six supports requiring construction rework are considered insignificant with respect to their effect on piping stresses and would not have caused the pipe to fail. These supports and their deficiencies are described in attachment No. 1.

# ECN 3184

Of approximately 435 unit 1 supports considered in the scope of ECN 3184, one support was found to require construction rework. The change required will be of a minor nature such as adding a shim rate to improve the bearing area for a lug bearing against structural tube steel. The problems encountered with the one support found is also described in attachment No. 1.

The review for ECN 2576 was carried out in accordance with the method described in WBP-EP 43.14, section 3.3.1, and the detailed results were checked and microfilmed. In addition, the results of the review for ECN 3184 were checked and microfilmed. A list of MEDS accession numbers for these reviews can be found in attachment No. 2. All suports identified to be deficient per ECN 2576 and 3184 will be corrected under ECN 4080.

To prevent recurrence of the problems encountered in implementing ECN 2576, Watts Bar mechanical group has revised EN DES-EP 43.14 to establish a method for reviewing and documenting changes to supports per revised analysis (figure 21, EN DES-EP 43.14). This review will identify all work required on pipe supports and provide a comprehensive list of support drawings to be identified on the ECN data sheet.

WATTS BAR NUCLEAR PLANT UNIT 1 - DOCUMENTATION SUMMARY FOR BLACK AND VEATCH TASK FORCE CATEGORY 14 COMMITMENT ASSOCIATED WITH NCR UBHSWP8301

### Conclusions

The reviews which have been done for ECRs 2576 and 3184 have shown that the implementation of ECNs in Watts Bar Mechanical Design Project are carried out with a high level of confidence that the scope of ECNs are correctly implemented on EN DES drawings. Although ECM 2576 revealed eight percent of the supports reviewed would require changes only one-tenth of a percent required any construction rework. ECN 2576 is considered unique in the fact that thousands of drawings were involved, and the designs were done over a long duration. These drawings were controlled by many supervisors and the analysis scoping procedure as now required by EM DES-EP 43.14 was not in effect, leading to inadequate scoping of the ECN. Our review for ECN 3184 revealed that only one pipe support which was marginally overstressed required a change. From these results, we feel that the one-tenth percent construction rework and the seven and mine-tenths percent documentation failure rate for ECN 2576 is not generic and the processing of ECNs by Watts Bar Mechanical Design Project is done with a high level of quality control.

TVA Tack Force for Review of Black & Vestch Findings

EVALUATION SHEET

Date 11/1/83

- 1. Task Force Category 18 for Watts Bar Muclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

A technical note on a piping support drawing (47A050-17 note #3) was found to be invalid for some applications: 1761

- 3. Evaluation for Cause
  - A. Preliminary

Drawing was not adequately checked and no calculations were performed to verify the adequacy of the technical note on the pipe support drawing.

B. Final The note was issued with the intention that its application is good for selfdrilling anchor bolts only (the maximum diameter is 7/8 inch). The designer and checker did not anticipate any other types of bolt sizes larger than 7/8inch dismeter that will be used in pipe supports. Later, different type bolts (and thus larger bolts) were used but the note was not revised.

Resp. Org. R. D. Prett 4/15/83 Task Force Concurrence When NV-183

- 4. Evaluation for Generic Examples
  - A. Preliminary

- Find all examples where a 1-1/4" or larger wedge bolt was omitted because of note 3 on drawing 47A050-1T.

- This finding indicates that deviations could exist for technical notes on other typical support drawing series. A sample program for 10% of the technical notes to verify their validity and existence of calculations will determine if other exemples generic to this finding exist.

B. Final EN DES has identified 10 systems of which there are supports that have 1-1/4" diameter wedge bolts. We will review these supports and will continue our evaluation to determine if there are other supports (with another type of bolts which sizes are larger than 7/8" diameter) that are a potential candidate for the note. EM DES will send these drawings to COMST for verification (if the note is applicable). EN DES has completed the evaluation of all typical supports and general sotes and found all to be adequate (WBP 830914 230).

Resp. Org. (10/24/83 Task Force Concurrence ////0/83

### 5. Licensing Basis Satisfaction

#### A. Preliminary

Licensing basis impact cannot be determined until all examples of deviations are identified and evaluated.

#### B. Finel

Sens-as-5.4. As a result of the review in step 4 of other typical notes and the results of step 8A review for applications of the deficient note, the licensing basis is met.

Resp. Org. R. A. Hatt 4//5/83 Task Force Concurrence 2/1/6/83

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

#### A. Preliminary

No corrective action identified by the task force.

B. Final
EN DES has completed its evaluation of all 10 systems and has determined that
there are 22 supports with 1-1/4" \$\text{g}\$ wedge bolts or 1" \$\text{g}\$ grouted anchors that
could be adverse conditions if the note was applied. EN DES has sent the list
of supports to COMST requesting them to verify whether the note has been used.
If the note was used, COMST will provide the exact weld length and size. This
data will be used to determine the adequacy of the installation. Redesign and
reconstruction will be performed as necessary. These plans are adequate.

Rasp. Org. 1. 1. 1. 183

# 7A. Identification of Corrective Action for Completed Work

# A. Preliminary

Analyze the adequacy of all generic examples identified under 4A and design and/or reconstruct as necessary.

B. Final
EN DES will evaluate CONST's findings. If the note has been applied, EN DES
will perform the necessary calculations to determine the adequacy of the
substituted welds. If the note has not been used, the support is satisfactory.
Since no other notes of this nature were found to be deficient in step 4, no
further corrective action is required.

Basp. Org. R. A. Pratt 1114183 Task Force Concurrence 24/11/0/83

SA. Implementation and Inspection of Corrective Action for Completed Work

A. Preliminary

B. Final COMST has completed its inspection of all supports identified by EM DES (see WEP 830429 032 and WEW 830523 005). Of the 22 supports identified to COMST, the substitution of welds for enchor bolts was made on 5 supports. Review of the detailed calculations for these supports determined the installations are adequate.

Basp. Org. R.D. Pratt 716183 Task Force Concurrence W. Mol83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Mone identified by the task force.

B. Final - Following actions have been taken to alleviate these conditions: (1) EN DES has stopped the use of this note for bolts 1" \$\textit{\textit{g}}\$ and larger and the drawing note will be revised to limit the applicability of the note; (2) EN DES has issued a construction specification that provides requirements for locating attachments on any embedded plate. This specification (H3C-928) will require a detailed review of connections of this nature.

Resp. Org. R.D. Patt 11/4/83 Task Force Concurrence When 11/10/8.

10A. Identification of Corrective Action for Future Work

A. Preliminary

- Nevise EN DES EP-3.03 to clarify requirements and applicability of calculations for technical notes on design drawings.

- Train all SWP personnel involved in the design and checking of support drawings in the requirements of EN DES EPs 3.03 and 4.25.

B. Final

The plan in 9.A.B is adequate.

Resp. Org. R.A. Rett 573/83 Task Force Concurrence W/ 1114/83

|    | . Implementation of Corrective Action for Puture Work  A. TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 2/21/84

- 1. Task Force Category 19 for Matts Bar Muclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Equipment cannot be determined to be environmentally qualified to NUREC-0588: 7140 and 7144.

- 3. Evaluation for Cause
  - A. Preliminary

The design control process failed to recognize the need to systematically environmentally qualify equipment for postulated accidents.

B. Final

The design control process failed to recognise the need to systematically environmentally qualify equipment for postulated accidents.

Resp. Org. MR Referr6/2/83 Task Force Concurrence 26 6 16 183

- 4. Evaluation for Generic Examples
  - A. Preliminary

The very nature of the findings does not lend itself to a sample approach for bounding the problem to the AFW system. The EN DES equipment qualification program under NUREG-0588 prescribes an adequate approach to identify generic examples for WBM Unit 1.

B. Final

The very nature of the findings does not lend itself to a sample approach for bounding the problem to the AFW system. The EN DES equipment qualification program under HUREG-0588 prescribes an adequate approach to identify generic examples for WBH Unit 1.

Basp. Org. MR Below 6/2/83 Task Force Concurrence War 6/6/83

# 5. Licensing Basis Satisfaction

A. Preliminary

Lack of environmental qualifications for safety related equipment does not satisfy the licensing basis. Some currently known examples have been identified where the equipment was not qualified.

B. Final

Lack of environmental qualifications for safety related equipment does not satisfy the licensing basis. Some currently known examples have been identified where the equipment was not qualified.

Resp. Org. MRB. eleur 6/3/83 Task Force Concurrence

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

EN DES has developed and implemented a comprehensive program to determine environmental qualifications of equipment and correct as necessary, including the documenting of all identified deficiencies via the MCR process. This is an acceptable approach.

B. Final

EW DES has developed and implemented a comprehensive program to determine environmental qualifications of equipment and correct as necessary, including the documenting of all identified deficiencies via the NCR process. This is an acceptable approach.

Resp. Org. MR Below 6/3/83 Task Force Concurrence 2/6/83

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The EM DES environmental qualification program includes appropriate corrective action to verify qualifications or require replacement of previously procured and installed equipment.

B. Final

The EM DES environmental qualification program includes appropriate corrective action to verify qualifications or require replacement of previously procured and installed equipment.

Resp. Org. MRB eleur 6/3/83 Task Force Concurrence 6/6/83

- SA. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Finel

Our engineering procedures and our NUESC 0588 program are adequate to assure proper handling of systems important to safety.

Resp. Org. MR Relucte/3/83 Task Force Concurrence

He 7 124/53

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

The Task Force is not sware of any action.

B. Finel

Presently there is no identified program to ensure implementation of corrective action for future work. However, a nonconformance report GENGER \$204 has been written on this problem. The Muclear Engineering Branch is to resolve this nonconformance report.

Resp. Org. MRR. Lun 6/3/83 Task Force Concurrence

Who 616183

10A. Identification of Corrective Action for Future Work

A. Preliminary

IN DES needs to revise the design control process to provide environmental qualification of equipment.

B. Final - Our NUREG 0588 program presently provides an adequate identification of environmental qualification requirements for future work. In addition, EP 3.01 has been revised to reference environmental drawings. The Watts Bar design criteria has also been revised. EEB has reviewed the attached "Equipment Qualification Program" and has found it adequate for "corrective action" for NCR GENQAB 8204. The need for an interdivisional procedure has been identified in the "Equipment Qualification Program" and this need has been coordinated with OQA.

### EQUIPMENT QUALIFICATION PROGRAM

The need for a comprehensive program to concisely direct and control all activities associated with establishing and maintaining the required level of environmental and functional qualification of safety-related components has become more evident as the work required by IEB79-01B and NUREG-0588 has progressed.

The evaluation work in progress or completed to date has been conducted in compliance with existing procedures that govern specific activities, such as design calculations; however, there has been an absence of an integrated approach to control and insure that the required qualification level of each component is maintained throughout the life of the plant. The proposed programmatic approach to resolve the concerns is depicted by the attached informational flow charts developed to address:

- The completed, current and future activities related to IEB79-01B, NUREG-0558, and 10CFR50.49,
- Any new system that may be added to a plant environmental some or acces.
- The procurement of any safety-related component by EN DES or NUC PR and.
- The installation and maintenance requirements and activities on a component specific basis.

Currently there are 18 Engineering Procedures that govern specific activities associated with equipment qualification. For the proposed program 3 of these will need revision and 7 others need to be developed. One of the 7 will be an interdivisional procedure and one will be an upper tier document addressing the overall program.

The attached listing of existing applicable engineering procedures are indicated on the programmatic flow charts by the number as listed.

EP-4.01 (number 10 on list) requires further consideration for revision to environmental drawings.

EP-5.14 (number 15 on list) requires revision to reflect special handling of wendors qualification test reports.

EP-5.43 (number 18 on list) requires revision to include special handling of qualified items in both vendor shops (waiver approval limitations) and receipt handling at the site.

The detailed review of this proposed program may necessitate some changes to the flow charts and the procedure consideration as now envisioned and these will be incorporated as each need is identified.

The proposed schedule for implementing the plan is as follows:

Issue plan for review February 10, 1984

Finalise plan April 13, 1984

Final identification of required revisions
to existing procedures April 13, 1984

Final identification of new procedures needed April 13, 1984

Complete draft of new procedures and revisions
to existing procedures

June 15, 1984

Issue new procedures October 15, 1984

Implementation November 1, 1984

The above schedule was developed unilaterally and is subject to revision as the work progresses and will be dependent to a degree on priority considerations of those involved.

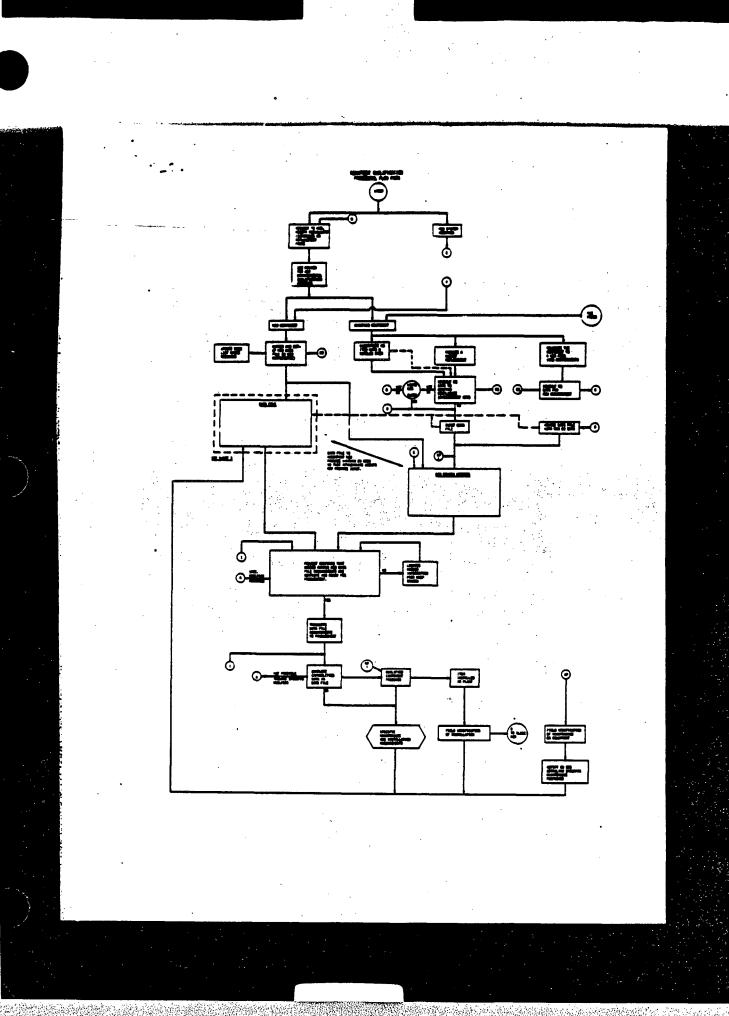

New procedures potentially required are indicated by asterisks in the blocks of the programmatic flow chart as follows:

- (\*) To cover input, use and revision of the data base
- (A\*) An interdivisional procedure to cover field varification of installation and maintenance activities for input to the data base and for closure of an MCR (if one is issued)
- (B\*) To cover review for impact on existing system components, etc., resulting from new system addition in an existing environmental some
- (C\*) To cover qualification testing
- (D\*) To cover "refined" analysis for a specific component in an existing environmental zone
- (E\*) To cover the structure of the data base
- (F\*) An upper tier procedure or document to define the overall program

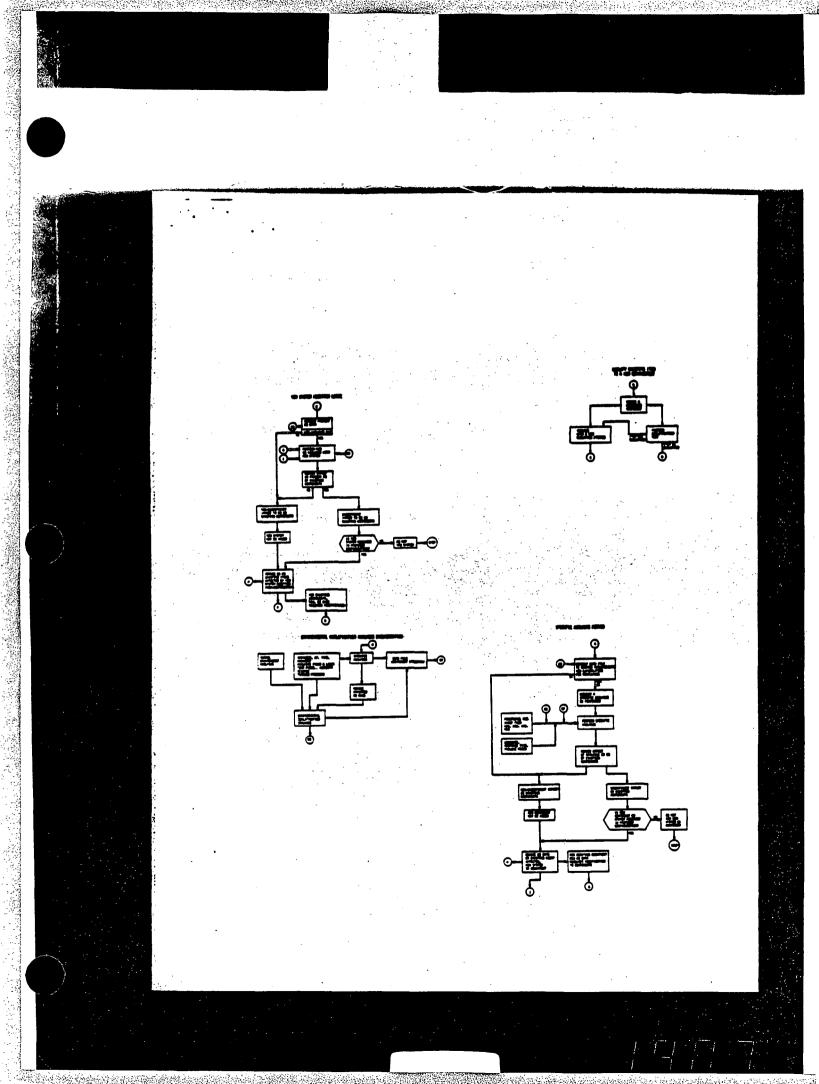

## ATTACHMENT EXISTING PROCEDURES

- 1. MCR's Reporting and Handling (EP-1.26)
- 2. Control to Documents Affecting Quality (EP-1.28)
- TVA Hemorandums Transmitting Quality Information Handling in EM DES (EP-1.50)
- Mandling of Conditions Potentially Reportable Under Title 10 CFR
  - :. Part 21, 50.36, and 50.55(e) (EP-2.02)
  - 5. Design Criteria Documents (EP-3.01)
  - 6. Seismic Design, Review and Control (EP-3.02)
- 7. Design Calculations (EP-3.03)
- Design Verification Methods and Performance of Design Verifications (EP-3.10)
- 9. QA List Preparation and Handling (EP-3.48)
- 10. Signatures/Initials for Preparation, Review, and Approval of EM DES Drawings (EP-4.01)
- 11. Engineering Change Notices (ECR's) before Licensing HandFirst (EF-4.02)
- 12. Field change Requests Initiated by NUC PR (EP-4.06)
- Design change Requests (DCR's) Processing, Reviewing, and Approving (EP-4.18)
- Engineering Change Notices (ECNs After Licensing Handling (EP-4.52)
- 15. Vendor Documents Handling and Disposition (EP-5.14)
- 16. Processing Procurement Requests (EP-5.20)
- 17. Procurement Quality Assurance (EP-5.33)
- 18. Release of QA Items from Suppliers' Shops to Construction Site (EP-5.43)

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 3/6/84

1. Task Force Category 20 for Watts Bar Muclear Plant - Unit 1

Task Force Category Description and Related B&V Findings:
 No procedure for documenting time delay relay settings that are determined by preoperational test and the preoperational test did not identify or regire the documenting of these settings: F113, F125, F126, F132 and F801.

3. Evaluation for Cause

A. Preliminary

The written design control process did not identify and control the time delay relay settings.

B. Final

Same as above.

Resp. Org. M. R. Relew 7/13/83 Task Force Concurrence 8 29/83

4. Evaluation for Generic Examples

A. Preliminary

This deviation applies to all systems that require time delay relay settings.

B. Final

Same as above.

Resp. Org. M. R. Belew 7/13/83 Task Force Concurrence 8 127/83

- 5. Licensing Basis Satisfaction
  - A. Preliminary

The licensing basis for these time delay relays was not satisfied.

B. Final

The licensing commitment was not met, but the effect on the licensing basis is indeterminate because the pre-op test was not run without the settings documented.

M R Below 3/6/87

Resp. Org. M. R. Below 7/13/83

G X /beg an 8/29/93

Task Force Concurrence 2/6... 8 12/83

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

The MCR WEMERS 8301 has been written to identify the Black & Veatch finding, however no corrective action has been identified.

B. Final .

The preoperational tests are being updated to include the setting and recording of the time delay relay settings. Special Engineering Procedure EN DES SEP 83-11 is being written to have the time delay settings put on the drawings. Interim memo (EES 830614 939) was written to document the relay settings.

Resp. Org. H. R. Belew 7/13/83 Task Force Concurrence 2/12/83

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The corrective action identified under item 10A should be backfitted for all time delay relays.

B. Final

Same as above.

Resp. Org. M. R. Belew 7/13/83 Task Force Concurrence 2/8/27/83

- SA. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final. All time delay settings determined by preoperative test prior to issuance of interim memorandum (EEB 830614 939) were adequately documented. Same-as-above Preop test TVA-22 scoping document has been changed (see Continuation Sheet)

(see Continuation Sheet)

Org. 1070-0 8-25-83

Task Force Concurrence

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

The task force is not sware of any action.

B. Fina!

Special Engineering Procedure EN DES SEP 83-11 is being written to include the delay relay settings in the preoperational tests.

Resp. Org. H. R. Belew 7/13/83 Task Porce Concurrence 2 8 E7/83

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary

EN DES should establish control of time delay relay settings within the design control process.

B. Final

Special Engineering Procedure EN DES SEP 83-11 will provide adequate control to assure proper documentation of the time delay relay setting.

Resp. Org. H. R. Belew 7/13/83 Task Porce Concurrence 2 8 20/83

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |
|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |

The second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of th

TVA Task Force for Review of Black & Vestch Findings

BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

## 8A. B. Final (continued)

(NEB 821130 276) and SEP 83-11 has been issued to require documentation of all TD settings determined after June 14, 1983. These settings will be reviewed by EN DES after TVA-22 is rerun. This corrective action is not completed but will be tracked by the preop program and EN DES-SEP 83-11 through completion.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R1 Dete <u>\$/25/83</u>

- 1. Task Force Category 23 for Watte Ber Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings: Auxiliary feedpump turbine trip and throttle valve PCV-1-51 is not included in the active valve list. The design of the valve schematic does not include the required control room bypass and test indication, nor automatic bypass of the "open" torque switch: F128, F133.
- 3. Evaluation for Cause
  - A. Preliminary

Lack of control during the determination of safety-related equipment. This process did not employ design verification.

B. Final

The failure to include the sumiliary feedwater turbine trip and throttle valve PCV-1-51 on the active valve list was an isolated error. This list was prepared in 1974 using specific selection criteria. Also, the list was reviewed within EW DES and comments were resolved through the squadchecking process. After resolution of all comments, the list was issued by memorandum. The subject valve was initially on the list but was removed during the review process due to an error in evaluating the functions of the valve.

Resp. Org. OTClift 9/1/183 Task Porce Concurrence 21/193

- 4. Evaluation for Generic Examples
  - A. Preliminary

The identified cause does not lend itself to a sample approach for bounding the problem to AFW. A review of the FSAR active valve list needs to be performed to verify it includes all appropriate components.

B. Final

This is not a generic problem associated with the valve list as shown by the evaluation in item 3. The FSAR active valve list will be reviewed and updated as required during the FSAR review process described in the task force category 4.

Resp. Org. 1764 91/183 Task Force Concurrence 2/62-91/183

# 5. Licensing Basis Satisfaction

## A. Preliminary

Licensing basis is not satisfied because required configuration for safety related related valve was not identified and implemented.

### B. Finel

Since corrective action will be taken to modify valve FCV-1-51, the licensing basis for the plant has been satisfied.

Resp. Org. DTCloff 91/183 Task Force Concurrence 2/6-71/18-3

## 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

### A. Preliminary

The task force is not swere of any action.

## B. Final

No additional corrective action is required, but the FSAR will be reviewed and revised as described in item 4 above.

Resp. Org. 107 Class 91/183 Task Force Concurrence 2/1/183

# 7A. Identification of Corrective Action for Completed Work

## A. Preliminary

HEB needs to revise the FSAR active valve list. Satisfaction of IE Circular 81-13 needs to be accomplished for any other examples identified under 4A.

# B. Finel

The FSAR active valve list will be reviewed per item 4 above. If additional discrepancies are identified, the required modifications will be identified for corrective action. Valve FCV-1-51 will be modified per the Black and Veatch finding as identified in WBN BCN 3642.

| M. | Implementation | and Inspection | of Corrective | Astion for Co | maleted Hork |

A. Preliminary

## B. Finel

WMM BCH-3642 has been issued to implement corrective action on valve FCV-1-51 which was identified during the Black and Veatch review. Any additional discrepancies identified during the review per item 4 will be documented and handled in a similar manner.

Resp. Org. OTCliff 91/183 Task Force Concurrence 21/183

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

The task force could not identify any action in place to correct.

B. Final

No additional corrective action is required based on the information provided in items 3, 4, and 5.

Resp. Org. Willes 91/18 Task Force Concurrence 25 71/183

10A. Identification of Corrective Action for Future Work

A. Preliminary

The responses to IE Bulletins, Circulars, and Notices need to be based upon current controlled lists.

B. Finel

Each IE bulletin, circular, or notice should be evaluated upon receipt to determine the most appropriate method for evaluation. In regard to the active valve list, this list will be reviewed and updated if required per item 4 and will be maintained in the future as the plant design changes; therefore, this specific list will be a current controlled list. IE bulletins, circulars, and notices are handled within EM DES by EP 2.10 and are identified on the TROI systems for tracking purposes.

TVA Task Force for Review of Black & Veatch Findings

BLACK & VEATCH EVALUATION SHEET (Continuation Sheet) TVA Task Porce for Review of Black & Vestch Findings

EVALUATION SHEET

Rev. R1 Date 9/23/83

- 1. Task Force Category 25 for Watte Ber Muclear Plant Unit 1
- Task Force Category Description and Related B&V Findings:
   Flange evaluations were omitted in some analysis calculations: F322.
- 3. Evaluation for Cause
  - A. Preliminary

Plange qualifications were not always done by calculations or other documented means. Qualification of these flanges by detailed calculations was not considered necessary.

- B. Final

  Flange qualification was deleted from one of the evaluated AFW problems. Checklists indicated those flange qualifications were required. The summary for this
  specific problem indicated that there were no flanges which required qualification.
  Analysts were searce of the need to qualify the flanges by detailed calculations.

  This type of error is largely contributed to individual error, inexperienced
  personnel, and the fact that some of the initial analyses was conducted prior to
  the quality control that is presently utilized.

  Resp. Org. Analysis April 19 Column Task Force Concurrence
- 4. Evaluation for Generic Examples
  - A. Preliminary

Flange qualification needs to be reviewed for all rigorous analysis problems for true 1

B. Final

Flange qualification is presently being reviewed for all rigorous analyses for WBW. (Several other deletions have been identified.)

The review has been completed and nine problems have been identified for which the flanges qualification had not been documented in the analysis.

Resp. Org. The Commence 2/12/83 Task Force Concurrence 2/12/83

# 5. Licensing Basis Satisfaction

#### A. Preliminary

The licensing basis was satisfied for the two deviations identified by \$6V. Until all flanges have been evaluated and qualification determined the potential exists that the licensing basis was not satisfied.

#### B. Final

Licensing basis is satisfied thus far since the B&V finding and the corrections made to date have not identified any examples of flanges where failures could occur or stress allowables could be exceeded. Until all flanges are evaluated, as in 4.3., there exists a slight potential that the licensing basis was not satisfied.

All flanges have been evaluated and it has been determined that they are qualified. The licensing basis is satisfied.

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

## A. Preliminary

The current planned corrective action for WBHCEB 8222 (not yet documented) appears acceptable to identify and correct all examples at WBH 1.

#### B. Finel

The current planned corrective action for WENCEB 8222 (a 100-percent review of all WEN problems to assure proper documentation of flange qualification) appears adequate to correct all completed work at WEN.

Resp. Org. The Concerning 1/2/87 Task Force Concurrence 2/6---- 9/3/83

# 7A. Identification of Corrective Action for Completed Work

## A. Preliminary

Calculations need to be performed to qualify all the flanges in the rigorous analysis problems.

# B. Final

The plan in 6A appears adequate.

Resp. Org. The Concurrence Track Force Concurrence 7/3/83

A. Preliminary

# B. Finel

A 100 percent review of all problems has been completed. Hine problems were identified for which the flange qualification had not been included in the analysis package. The flanges were evaluated and determined to be qualified. With the exception of several problems which are being reanalyzed, documentation willbe unervaled by Assurat 31, 1983.

upgraded by August 31, 1983.

# 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Task force is not mere of any action.

#### B. Finel

The latest checklist precisely notifies the analyst of the requirements for the proper flange qualification and documentation. The checklist is presently identified in J. E. McCord's memorandum to CES Files (CES 821006 003) and will be incorporated into the WEM rigorous analysis handbook.

Resp. Org. Angling 9/12/53 Task Porce Concurrence 24/183

# 10A. Identification of Corrective Action for Future Work

A. Preliminary

Specify and implement criteria for demonstration of flange qualification.

B. Finel

The action identified in 9A.B appears to be adequate.

|      |                                                     |                |              |        |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |     |  |

TVL Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

1. Task Force Category 30 for Watts Bar Nuclear Plant - Unit 1

2. Task Force Category Description and Related B&V Findings: Failure to satisfy design criteria for 1) monitoring operability and 2) providing adequate electrical protective devices for the motor driven auxiliary feed water pu lube oil pump: 1) F100 and 2) F136

## 3. Evaluation for Cause

## A. Preliminary

1) and 2) SWP failed to adequately design and/or review the design of safety system support equipment which operates full time with respect to criteria for status monitoring and electrical protection. The cause is not clearly understood but was due to inadequate implementation of existing design control requirements.

1) Design was based on EN DES assumption that equipment would not be taken out of service more frequently than once a year; hence status monitoring was not required (Ref: RG 1.47). NUC PR maintenance has determined that this is not the case; however. EN DES was never notified of this fact due to lack of procedures addressing status monitoring requirements.

2) Failure to comply with EN DES-EP 4.25 due to inadequate knowledge of engineering procedures by EM DES personnel.

Resp. Org. 9. 0. Colling 825/83 Task Force Concurrence Village 5 KL/83

## 4. Evaluation for Generic Examples

#### A. Preliminary

1) and 2) A review needs to be performed of all WBMP designs involving full time operating equipment which supports the operability of safety related equipment to identify generic examples where status monitoring and/or electrical protection were not satisfied.

developed

1) A generic review will be conducted after -58 -986 (EEB) -prepares a procedure is specifying how MUC PR and EM DES will exchange information regarding maintenance schedules for plant equipment.

2) Review of all full-time operating equipment supporting safety-related equipment determined only one other example of failure to electrically protect devices: Aux FW pump valve electro-bydraulic actuators (1-MTR-3-122-A, 1-MTR-3-132-B) (Ref: Memo from C. C. Fisher to WBP Files dated June 10, 1983 (WBP 830610 032).

# 5. Licensing Basis Satisfaction

A. Preliminary

1) The licensing basis was not satisfied since the MD AFF lube oil pump was expected to be deliberately made inoperable more frequently than annually, hence requiring status monitoring.

2) The licensing basis was not satisfied since neither the MD AFF lube oil pump motor nor its cable were adequately protected as specified in FSAR 8.3.1.1.

B. Final

1) Licensing basis is satisfied for the MD AFP lube oil pump since it has been added to status monitoring on ECN 3827.

Resp. Org. 9. D. Ordine 8/25/83 Task Force Concurrence 25/ 8 bt 183

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

## A. Preliminary

1) The task force is not aware of any action.

2) BCM 3636 identifies F-136 and commits to addition of appropriate electrical protection. This is appropriate except that it does not cover generic examples.

#### B. Final

1) BCN 3827 added MD AFW lube oil pump to status monitoring (Ref: EM DES response to finding F-100).

2) BCN 3636 referenced F-136. It also included generic examples specified in 4A.

Resp. Org. 9. D. Colleg. 4/25/83 Task Force Concurrence 26 8 54 83

# 7A. Identification of Corrective Action for Completed Work

A. Preliminary

1) and 2) Addition of appropriate electrical protection and/or status monitoring is needed for all deviations generically identified under 4.

B. Final

1) Generic examples, if found, will be corrected after review in item 4-44 is complete. BEB will provide schedule regarding properation and issue of procedure.

2) Generic deviations included in ECN 3636.

Resp. Org. 9. D. Colline 8/25/83 Task Force Concurrence 3/19/54

- . Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Finel (1) CTR R293 will track the completion of past work by reviewing the maintenance schedule to determine if the requirements of status monitoring in RC 1.47 are met. Any deficiencies will be corrected.

(2) ECN 3636 has been completed (SWP 830303 618).

Basp. Org. 9.8. Collins 13 119/14 Task Force Concurrence 26/184

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary
    - 1) and 2) The task force is not aware of any action.
  - Final

    1) Procedure will become part of EN-DES issued and controlled documents and will B. Final be reviewed periodically per Engineering Procedures Training and Utilization Program (Ref: memorandum from M. M. Sprouse to Those listed dated February 26, 1983 (MEB 820226 255).
  - 2) Engineering Procedures Training and Utilization Program initiated by H. W. Sprouse P4/13

to Those listed dated February 26, 1982 (NEB 820226 255), Resp. Org. 9:00 8 /25/83 Task Force Concurrence T.D. Colore 3/19/84

10A. Identification of Corrective Action for Future Work

- A. Preliminary
  - 1) and 2) More definitive causes must be established in 3 in order to identify appropriate actions to improve future work.
- B. Finel
  - 1) Same as (2).
  - 2) Mone necessary due to ongoing corrective action specified in 9A.

TVA Each Porce for Review of Black & Vectoh Findings

EVALUATION SHEET

Nov. El Date 5/27/83

- 1. Task Porce Category 31 for Watte Ber Muclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings: Editorial discrepancies in licensing documents: Fil9 and F321.
- 3. Evaluation for Cause
  - A. Preliminary

The preparation process and checking through CEDC and Power Regulatory Staff did not identify and correct all editorial discrepancies.

B. Finel

Both findings describe FSAR errors that are editorial in nature.

Rasp. Org. OTCLA 4 137183 Task Force Concurrence 24 4 102153

- 4. Evaluation for Generic Examples
  - A. Preliminary

The low editorial error rate found in AFW commitments combined with their lack of plausible negative impact does not warrant an evaluation for generic examples at this time.

B. Final

No further evaluation is required.

Rasp. Org. DTClff 4137183 Task Force Concurrence 24/2-4/27/83

TVA Task Force for Review of Black & Vestch Findings

EVALUATION SHEET

Rev. <u>83</u> Date <u>12/19/83</u>

- 1. Task Force Category 12 for Watta Bar Muclear Plant Unit 1
- Task Force Category Description and Related 86V Findings: Incompatible nonelectrical drawings: P753, P858, P865, P866, P932, P939, P942, P976, P983.
- 3. Evaluation for Cause
  - A. Preliminary
    - Inadequate drawing checking and design verification prior to issuance.
    - Inadequate recognition of need to revise companion drawings during design change process.
  - B. Final

The following causes are identified:

- Inadequate coordination between branches per EP 4.04 as to checking and design verification prior to the issuance of drawings
- Drawings were not checked thoroughly to insure correctness and legibility
- Design and construction are not complete at this time

Resp. Org. J. Mosl 5/5/83 Task Force Concurrence 2/15/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

Problem is generic to hanger drawings and isometrics.

B. Final

A review of feedwater isometric, 47W401-212, was performed and this problem was not found. A more extensive review will be performed under steps 6, 7 and 8 to assure compliance with documentation.

Resp. Org. 99 Mark 5 15 183 Task Force Concurrence 24 519183

|       | ۸.        | Preliminary This situation provides an inconvenience to COMST; however, the controls required successfully correlate the hanger location on the physical drawing with the hanger location on the analysis isometric to satisfy the total tolerance prescribed in G-precludes improper hanger installation as a result of these momenclature discrepancies.                                                                       |
|-------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <b>3.</b> | Final This situation is only an inconvenience to COMST. TVA walkfown inspection, WBM 79 14, in place per ECM 3100 will identify any visual discrepancies, and drawings will be corrected. Hangers are installed per hanger detail analysis isometrics. This method prevents improper hanger installation even though nonenclature discrepancie exist. Inspection will be more stringent in the future as a result of 36V review. |

- 78. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 68.A. appears adequate.

B. Final

The plan in 63.3 is adequate.

Resp. Org. 10 Mark 5,5,83 Task Force Concurrence 26 5,9,83

- 8B. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary

H/A

- B. Final
  The preliminary walkdown inspection, CKB 81-30, completed under ECH 2576 for
  Unit 1, plus ECH 4080 to be completed by 12-30-83 were implemented to insure
  that supports are installed at the analysed location. The final walkdown
  inspection, WBH-79-14, has been implemented and any corrective action required
  is underway. This corrective action is being tracked per the disposition of
  HCR WBHSVF 8248 and ECH 3100 and is scheduled to be completed by 1-30-84.
  Resp. Org. 2011ack /2 /21/8 Task Force Concurrence
- 9B. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

The task force could not identify any in place or proposed corrective action.

B. Final

Procedures exist within EM DES to prevent these discrepancies from occurring on any future work.

|      |           | Total Concurrence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

TVA Task Force for Review of Black & Weatch Findings

EVALUATION SHEET

Nov. 81 Date 4/6/83

- 1. Task Porce Category 33 for Matta Bar Meclear Plant Unit 1
- Task Force Category Description and Related 36V Findings:
   Inadequate cable tagging: 7807 and 7809

# 3. Evaluation for Cause

A. Preliminary - Finding F807 was caused by oversight. The information on the tag had the correct cable number and that it was safety-related but the color of the tag was incorrect. Finding F809 was caused by repetitious rework which resulted in the legibility of the tag to be in question.

#### B. Finel

Construction agrees with the preliminary evaluation.

-Finding F807 was definitely caused by oversight. The cable was tagged with the correct colored tag within 5 feet of the incorrect tag.

-Finding F809 was caused by the fact that the hydraulic activator had to be removed several times during construction. Bydraulic oil inadvertently spilled on the tag and caused the identifier legibility problem.

Basp. Org. Ed Bush 4 1/8/83 Task Force Concurrence Warm 14/18/83

### 4. Evaluation for Generic Examples

#### A. Preliminary

This is not considered to be generic due to the low frequency and the findings do not present a sefety problem.

### B. Final

Construction agrees with the preliminary evaluation. These findings are not considered to be generic because they are isolated cases. A construction walk-through inspection is conducted and also a joint COMST/NOC PR walkthrough inspection is conducted prior to transfer. These walkthroughs are designed to find and correct these type errors.

TVA Tack Porce for Bavior of Black & Vestch Findings

### SLACE & VEATCE EVALUATION SERBI (Continuation Sheet)

- 5. Licensing Basis Satisfaction (cont'd from page 2)
  - A. Preliminary

Accurate tagging is a means to improve control over construction inspection status and maintenance during plant operation.

- The miscolored tag identified under F-807 would hinder neither objective since the tag was properly inscribed.
- Only one example of F809 was identified and it was caused by repetitious remork involving removal and reinstallation of the component. (This finding cannot be use-us-is.) Since punchlist preparation and transfer inspection under WBN QCI 1.22 has been designed to identify and correct generic examples of damage due to work subsequent to final construction inspection this procedure would have identified and corrected this error.

Therefore, no further action required.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. - RO R1 Date - - 7/4/85 - 18/83

- 1. Task Force Category 34 for Matts Ber Muclear Plant Unit 1
- 2. Task Force Category Description and Related 86V Findings: "Out of function" feature of a drawing was not in agreement with the latest design drawing showing the detailed design of the "out of function" feature: F857, F910, F982, F984, F985, F986, F987, F988, F989, F992, F993
- 3. Evaluation for Cause
  - A. Preliminary

"Out of function" features have no effect on the technical adequacy of drawings and are for general location value. Checking of drawings and subsequent revisions of drawings do not include ensuring that all "out of function" features on drawings are in agreement with the latest detailed design for the feature.

B. Finel

Same as preliminary.

Resp. Org. A. Jonaton 4/24/83 Task Porce Concurrence 2/26/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

This example is typical of other discrepancies in "out of function" features. No sampling program is necessary because there are no potential deviations.

B. Final

Same as preliminary.

TVA Task Force for Neview of Black & Veatch Findings

EVALUATION SHEET

Rev. Ri Date 11/1/83

- 1. Task Force Category 35 for Watts Ber Muclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Instantaneous trip setting for motor-operated valve breakers is not in accordance with EN DES criteria and vendor recommendations: F137

- 3. Evaluation for Cause
  - A. Preliminary
    - RN DES critiers and recommendations provided by motor vendors for instantaneous trip setting were not applied correctly for MOV motors rated less than 1/2 hp.
    - Inadequate checking of the drawing to ensure compliance with established criteria.
  - B. Final

See Continuation Sheet (page 7).

Resp. Org. Accessor #17/03 Task Force Concurrence 1/17/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

This finding suggests that this deviation could be applicable to all MOVs with motors rated less than 1/2 hp. Corrective action in step 7A will identify all examples.

B. Final

Finding is generic to all loads fed from motor control center molded case instantaneous only circuit breakers. Corrective action in step 7A identified all examples.

Resp. Org. GALLOTO OM 9 | 83 Task Force Concurrence 11/183

# 5. Licensing Basis Satisfaction

A. Preliminary

- (1) The licensing basis is not satisfied because TVA is committed to meeting the requirements of the Mational Electrical Code and has failed to fulfill this commitment for instantaneous trip settings for motors in MOVs rated less than
- (2) The safety significance will have to be determined for each deviation identified.

Fine!

- (1) Same as above.
- (2) No significance to plant safety. Although instantaneous settings were higher then recom mended settings, all loads required to perform a safty function would perform acceptably.

### 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

The task force is not aware of any corrective action.

B. Finel

Mo ongoing corrective action for completed work was being done at the time of the finding.

Resp. Org. (1918) Task Force Concurrence 11/17/83

### 7A. Identification of Corrective Action for Completed Work

A. Preliminary

Review all safety-related MOVs with motors rated less than 1/2 hp and evaluate their circuit breakers instantaneous trip settings for compliance with the EN DES critiers established in DS-E9.2.1 and the vendor's recommended setting. Revise any settings as required to be in accordance with EN DES criteria and wendor's recommendation.

B. Final Review all safety-related MOVs with motors rated less than 1/2 hp was performed and documented by memo from C. C. Fisher to WBP Files dated June 15, 1983 (WBP 830615 022). The necessary corrections were made on ECNs 3904 (UI) and 3905 (U2) which were closed on September 8, 1983 (closure sheet 104 - WPB 830908 068). (See Continuation Sheet - page 7).

Resp. Org. amason 11 14 183 Task Force Concurrence 21 117183

SA. Implementation and Inspection of Corrective Action for Completed Work

A. Preliminary

B. Final

ECRs 3904 (U1) and 3905 (U2) completed and closed on September 8, 1983 closure sheet 104 (WBP 830908 068).

ECH 4251 - work in progress and will be tracked on ECH through completion.

Resp. Org. Laure 9/1/1/03 Task Force Concurrence 2/1/2/83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

The task force is not aware of any corrective action.

B. Final All designers and checkers have been been told to strictly adhere to all criteria used to prepare EN DES drawings, as part of the engineering procedures training and utilization program initiated by M. M. Sprouse Ref: Memorandum from M. N. Sprouse to Those listed dated February 26, 1982 (NEB 820226 255).

Resp. Org. Language 11 14183 Task Force Concurrence

10A. Identification of Corrective Action for Future Work

A. Preliminary

Provide training to personnel responsible for designing and checking drawings that contain trip settings for MOVs.

B. Final

Mone necessary due to ongoing corrective action specified in 9A.

Resp. Org. (MISTEN 1/ 14/83 Task Force Concurrence 2/ 1/17/83

TVA Task Force for Review of Black & Veatch Findings

#### BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

### 3.B. Final

Division of Engineering Design Electrical Standard 30A301 (issued 10-2-51) which was in effect at the time of Watts Bar initial circuit design, provided no criteria for molded case circuit breaker instantaneous trip settings. Instead, menufacturer's criteria provided as part of the motor control center contract, was used to determine correct settings. On September 28, 1976, TVA Standard 30A301 was superseded by EN DES Standard DS-E9.2.1. This standard specified (for the first time) that Hetiomal Electrical Code criteria would be used to set instantaneous only breakers. EN DES failed to fully retrofit this new criteria into its original design for the following reasons:

- (1) An assumption on the part of the designer and checker attempting to implement this requirement, resulted in setting the majority of breakers one setting too high. This occurred because the designer calculated 13 times the full load current (FLI) and then set the breaker to the next higher setting to prevent nuisance tripping. In actuality, he should have set it on setting lower for strict compliance with the NEC.
- (2) In some cases the existing breaker would have had to be replaced to adhere strictly to the MEC criteria. The designer judged that the lowest setting for the existing breaker, while slightly higher than 13 times FLI, was still adequate. In actuality the breakers should have been replaced for strict compliance with the NEC.

# 7A. B. Final (continued from page 2)

Additionally, all remaining safety-related loads fed from motor control center instantaneous only breakers were reviewed per request from EES dated September 8, 1983 (EES 830908 926). This review determined that 13 breakers required replacement and 385 breakers required resetting. ECN 4251 has been issued to make these corrections. The ECN package includes documentation of the study.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R1 Date 11/9/53

- 1. Task Force Category 36 for Watts Ber Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings: The cable tray fill criteria (FSAR section 8.3.1.4.5) is not assured of being met because of the less than conservative nominal values used for cable cross sectional areas in the cable routing program. F135
- 3. Evaluation for Cause
  - A. Preliminary
    Personnel involved did not identify that this potential deviation from the FSAR
    commitment would result in a condition adverse to quality. After the evaluation
    in Step 5, the cause(s) will have to be determined if the licensing basis is not
    satisfied.
  - B. Final

Refer to 5 A. B., Licensing Basis Satisfaction

Resp. Org. B.L. Suralland 11/10/13 Task Force Concurrence

11/4/83

- 4. Evaluation for Generic Examples
  - A. Preliminary
    After completion of Step 5, this will be evaluated for generic examples if the licensing basis is not satisfied.
  - B. Final

H/A

Resp. Org. A. 1 Surollars 14/0/93 Task Force Concurrence 2 1/11/1/83

- 5. Licensing Basis Satisfaction
  - A. Preliminary
    Licensing basis satisfaction needs to be investigated in the following areas: 1)
    FSAR requirements satisfied; 2) Effect on ampacity if overfill occurs in a power
    tray; 3) The tray dynamic response and tray support loading if tray overfill
    occurs; 4) Fire protection requirements if originally specified for 60% fill.
  - B. Final
    See Continuation Sheet (page 7)

Resp. Org. R.L. Santher 11/10/93 Task Force Concurrence

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    The task force is not swere of any corrective action.
  - B. Final

Resp. Org. R.L. Surellone 11/10/93 Task Force Concurrence 2/////83

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary
    To be determined if evaluation in Step 5 shows the licensing basis is not satisfied.
  - B. Final

### BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

- 5. Licensing Basis Satisfaction
  - B. Final
  - 1. The PSAR requirements have been satisfied as discussed below.
  - 2. This Black & Veatch finding erroneously identified cables as being installed in power (V4 level) cable trays; whereas, the cables identified are installed in control (V3 level) cable trays. The criteria for tray fill of V4 power trays is 30 percent of the available cross-sectional area of the tray; the tray fill for V3 control and instrumentation (V2 and V1) trays is 60 percent. The cable fill is based on summing the areas of the various cables that are randomly laid in the trays. Any minute variance in nominal cable diameter of power cables has no significance on cable area or tray fill; thus, there is no effect on ampacities of cables installed in power trays.

TVA procures insulated cables at different times for a project. The same type of cable, by identification mark number, meets the same specification even though different vendors may supply the cable. The cables are manufactured following the guidelines of the Insulated Cable Engineers Association (ICEA) standards which allow tolerances for insulation and jacket thickness. Therefore, cable diameters from the same or different vendors generally do vary slightly. Although TVA did not specify a maximum outside diameter (OD) for the WBM cables, vendors normally stay within ICEA tolerances of approximately 5 percent, obviously for competetive reasons. Variations in cable OD of multi-conductor cables are usually attributed to light-weight filler material.

For example, a 2-conductor No. 14 AMG control cable may be manufactured by the flat (two insulated conductors run parallel to each other with an overall jacket—oval shape) method, or by the round (two insulated conductors that are twisted with filler material under the overall jacket—round shape) method. This type cable is used for control functions that convey information or intermittantly operate devices controlling power switching or conversion equipment. Thus, conductor heating is insignificant for control cables, as well as instrumentation cables, and raceway fill does not affect cable ampacity.

For WBM, the majority (approximately 85 to 90 percent) of the two-conductor control cable furnished was constructed by the flat method. This oval-shaped 2-conductor cable was equated to have a nominal OD of .309 inches used for tray fill calculations. Some of the round-shaped two conductor cable has an OD of .404 inches. These two cables have the greatest disparity in OD and thus cross-sectional area as noted in the

### SLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

5. Licensing Basis Satisfaction (continued)

#### B. Final

Black & Veatch finding; again this difference is due primarily to the added light-weight filler material of the round cable. However, the average cable routed in control level trays is 5-conductor. Therefore, for a given control level tray, multi-conductor control cables may vary from a 2-conductor through a 19-conductor configuration.

Although TVA used nominal OD in calculating the cross-sectional area of the cable for tray loading purposes, the nominal OD may vary only a few thousandths of an inch compared to a respective cable vendor data. Even if these variances do result in a cross-sectional loading slightly above 60 percent fill for control and instrumentation cable trays, there is no effect on cable empacity. For power cables, the copper cross-sectional area is not increased by any increase of cross-sectional area of the finished cable assembly, due to increased insulation/jacket thicknesses. The adequacy of the current carrying capability and ampacity derating of power cables, when routed in trays, is considered by the cable designer when he sizes the cable for its application, including short circuit handling capability. For example, power cables for motor circuits are conservatively sized for 125 percent of motor ratings. Thus, adequate cable ampacity exists for power cables in trays which have a 30-percent fill by cross-sectional area.

- 3. Any minute differences in nominal cable ODs versus actual ODs have no impact on either the cable tray support system or the fire hazards analysis. The dead weight loading of cables, cable trays and fittings, and applicable cable coating used a conservative composite weight of 45 lbs/ft of tray (for 18-inch width) in the development of criteria for the cable tray support system. The composite weight and combustible loading are based on trays being 100 percent fill.
- 4. For the type of cables used, the insulations and jackets have a range of combustibles from 6000 to 14,000 BTUs/lb. The fire hazards analysis utilized a conservative 14,000 BTUs/lb fire loading of combustible cable material where cable trays occur. Horeover, the applied cable coating reduces the ignitibility and combustibility of the insulation/jacket material. In addition, where more than 120,000 BTUs/sq ft of installed combustibles exist in safety-related areas, a fixed suppression system is installed.

From this evaluation, minor variations in actual cable tray fill have no effect on cable empacities, on the support system, or on the fire protection system. Therefore, TVA's position is that the installation is satisfactory and complies with FSAR requirements.

EVALUATION SHEET

Rav. R1 Date 2/28/8

- i. Task Force Category 37 for Watts Bar Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings: Valve wiring circuits are designed such that the red and green indicating lights on the unit control board will light dimly upon malfunction of the P-suco contact of the Westinghouse W-2 control switch on the unit control board: F112
- 3. Evaluation for Cause
  - A. Preliminary
    - -Inadequate recognition of need to design circuits that do not rely on a situation that the operator must make a judgement of lamp brightness to determine equipment condition.
    - -Inadequate design checking/verification during circuit design process to allow "sneak circuit" condition to exist.
  - B. Final

    The need to design circuits that do not rely on operator judgment of lomp brightness to determine equipment status was recognized and design proceeded accordingly. However, the identified failure was the result of a single random design error in conjunction with inadequate design checking/verification during circuit design process.

Resp. Org. MRR elem 2/19/84 Task Force Concurrence ZE9/84

- 4. Evaluation for Generic Examples
  - A. Preliminary
    Problem is generic to valve wiring circuits containing Westinghouse W-2 switches
    throughout WBN unit 1.

EVALUATION SHEET

Rev. <u>82</u> Date 12/19/83

- 1. Task Force Category 38 for Watts Bar Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

Evaluation to determine if design of thermal overload bypass circuits met requirements of commitments to EG 1.106 and IEEE 279-1971: F108 and F122.

- 3. Evaluation for Cause
  - A. Preliminary

After the evaluation in Step 5, the cause(s) will have to be determined if the licensing basis is not satisfied.

B. Final

Licensing basis is satisfied. See Item 5 for justification.

Resp. Org. OR 144163 Task Force Concurrence 2113184

- 4. Evaluation for Generic Examples
  - A. Preliminary

After completion of Step 5, this will be evaluated for generic examples if the licensing basis is not satisfied.

B. Final

The condition is generic for Watts Bar Units 1 and 2 motor-operated valves.

Resp. Org. M. Full 12/183 Task Force Concurrence 2/13/84

## 5. Licensing Basis Satisfaction

A. Preliminary
WBN MOV thermal overload bypass design needs to be investigated for: (1)
Capability for "... testing and calibrating channels, and the device unit to
drive the final system output signal from the various channel signals, ..." as
required by IEEE 279-1971 (Section 4.10), and (2) Reasons for the BLM thermal
overload bypass circuit design philosophy differing from that used at BFM, SQB,
and WBM.

B. Final

See continuation sheet for justification.

Resp. Org. 12/24/89 Task Force Concurrence 2/13/84

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

Task force is not aware of any corrective action.

B. Final

No corrective action required.

Resp. Org. 20 12/21/83 Task Force Concurrence 24/184

7A. Identification of Corrective Action for Completed Work

A. Preliminary

To be determined after evaluation in Step 5 is complete.

B. Final

Mo corrective action has been identified. However, WB-DCR-482 will be implemented for operating convenience. This modification will add one relay to each of the eight motor control centers and change wiring so that an indicator light will come on when all overload bypass relays for a given motor control center operate. The modified test circuit will also fully satisfy the requirements of RG.1-106, G.I.b, and IEEE 279, 10.0. Resp. Org.

Resp. Org. D. D. College / 187 Task Force Concurrence 25 188

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Task force knows of no ongoing programmatic corrective action.

B. Final

The modified test circuit will be included with any motor operated valve overload relay bypass circuits added at Watts Bar Nuclear Plant in the future.

Resp. Org. M. Lulle 12/24/83 Task Force Concurrence 2

10A. Identification of Corrective Action for Future Work

A. Preliminary

To be determined if evaluation in Step 5 shows the licensing basis is not satisfied.

B. Final

### BLACE & VEATCH EVALUATION SHRET (Continuation Sheet)

- 5. Licensing Basis Satisfaction
  - B. Final
- (1) MG 1.106 (Thermal Overload Protection for Electric Motors on Motor-Operated Valves), identifies the criterion for thermal overload protection devices that are integral with the motor starter for electric motors on motor-operated valves. MG 1.106 also describes three methods that are acceptable to the Muclear Regulatory Commission staff for complying with the identified criterion. The method described in Position C.1.b requires that those thermal overload protection devices that are normally in force during plant operation should be bypassed under accident conditions. This position has been implemented at Watts Bar and Bellefonte Huclear Plants. Regulatory Position C.1 also requires that the bypass system circuitry conform to certain sections of IEEE 279. IEEE 279 Section 4.10 requires that devices used to derive the final system output signal be tested. These devices are the relays that actually perform the overload bypass. At Watts Bar Nuclear Plant, the testing of these devices is accomplished by pushing a test button at each motor control center, and observing that the relay for each individual valve operates. The relay operation is verified by checking to see if the relay indicator window, located on the side of the relay, changed state. The Regulatory Position also requires that the bypass system circuitry conform to Section 4.13 of IEEE 279. IEEE 279 Section 4.13 requires that a continuous indication of bypass be in the main control room if the protective action or some part of the system has been bypassed or deliberately rendered inoperative for any purpose. This section does not apply since no part of the protective action is bypassed during the test. Indication is provided in the main control room that the overload bypass signal has been initiated. The method of testing described above is acceptable for this application because it verifies relay operation by observation of a positive action. The licensing basis is satisfied in that the thermal overload bypass can be tested using one operator to initiate the test and a second operator some distance away to verify mechanical operation of the relay.
- (2) A test circuit modification to improve operating flexibility and convenience has been approved by EM DES. See design change request WB-DCR-482 (DES 830701 009); M. M. Sprouse to H. S. Green, September 21, 1983 (WBP 830921 056); and H. J. Green to M. M. Sprouse, Hovember 30, 1983 (DES 831201 012). When implemented, it will be possible for the operator initiating the test to determine that all bypass relays for a motor control center have operated by observing one test light.
- (3) At Bellefonte Muclear Plant, the testing of the overload bypass is accomplished by pushing a test button at each motor control center, and observing that an indicator light came on. This indicator light is wired up such that each overload bypass relay would have to operate before the light would come on. This also satisifies Regulatory Position identified in RG 1.106 and IEEE 279 Section 4.10. IEEE 279 Section 4.13 does not apply for the same reason given in 5.8(1). RG 1.106 came into effect at different construction phases of TVA's various nuclear plants. It is not a requirement that all TVA's nuclear plants be identical. In fact, different design organizations are performing the detail design for each plant and such things as expense and equipment availability are weighed heavier than making all plants identical.

EVALUATION SHEET

Rev. <u>R2</u> Date <u>3/1/H4</u>

- 1. Task Force Category 39 for Watts Bar Nuclear Plant Unit 1
- 2. Task Force Category Description and Related B&V Findings:

The specific configuration of 6.9-kV bundled cables in trays has not been tested for the effects of fire retardant coating on the ampacity of the cable: G901

- 3. Evaluation for Cause
  - A. Preliminary

TVA considered the tests performed to determine fire retardant coatings' effect on ampacity of cables to adequately justify not derating cables due to fire retardant coatings. Determination of cause(s) will be done if evaluation in step 5 shows licensing basis is not satisfied.

B. Final

Refer to 5.A.B. Licensing Basis Satisfaction.

Resp. Org. A.L. Suralland #/10/83 Task Porce Concurrence

- 4. Evaluation for Generic Examples
  - A. Preliminary

This finding indicates that other similar examples exist.

|----|-----------|--------|--------------|
|    | PTCAMBTUE |        | SACISTACTION |

A. Preliminary

Licensing basis satisfaction needs to be determined by evaluating the effects of the fire retardant coating on the ampacity of the 6.9-kV cables when the cables are bundled together in trays.

B. Final

See Continuation Sheet (page 7).

#### BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

# 5. Licensing Basis Satisfaction

#### B. Final

The licensing basis is satisfied because there is no significant effect on cable ampacity of installed 6.9-kV bundled 3-phase cables due to applied cable coating. An independent test showed that tightly packed power cables coated with Vimesco allows heat transfer just as good as air.

For short circuit ratings, TVA uses a minimum 2/0 AMG cable size for shielded power cable applications (6.9-kV service at WBM), which is conservative from an ampacity viewpoint. When routed in cable trays, these 2/0 AMG cables may be installed random lay (side-by-side with no space between cables). Shielded power cables larger than 2/0 AMG (4/0 AMG through 500 MCM) are grouped as 3-phase "seders and stacked in pyramids and separated from other grouped cable bundles by a nominal distance equal to the radius of the largest cable. A typical worst case arrangement of these cables is shown in Detail B of Figure 1. This spacing is provided to minimize the induced electro-motive forces (EMF) between phases when the cables are under load, and it does provide a more conservative design to more readily allow produced heat to be dissipated. However, the minimum spacing between cable bundles may be less where cables enter or exit the tray and at tray fittings, such as tees and crosses (i.e., the cable bundles may be in contact with each other).

The ampacities of shielded power cables installed in cable trays are determined from Electrical Design Standard DS-El2.1.2 for 90°C maximum copper conductor temperature in a 40°C ambient. The ampacity values for these cables given in DS-El2.1.2 are more conservative than the 80 percent factor suggested in ICEA 3-54-440 for converting ampacities of cables in free air to cable trays. The cable designer considers ampacity derating of power cables when he sizes the cable for its application, including short circuit handling capability and to maintain suitable voltage regulation. In addition, motor circuits are conservatively sized for 125 percent of motor ratings.

Where cable coating is required to meet fire protection requirements, it is TVA practice to coat exposed surfaces of cables including the spaces between bundles of shielded power cables. The coating is applied to a nominal 3/16-inch + 1/16-inch wet thickness. With reference to Detail B of Figure 1, it should be noted that the coating itself between cable bundles is not a heat source; instead the coating is an excellent conductor of heat, based on independent laboratory tests.

Testing performed for Vimasco by the Factory Mutual Research (FM) (Report No. J.I. 0F0Q5.AF) concluded that with two wet coat thicknesses of 1/8-inch each (1/4-inch maximum thickness which is upper limit of TVA design), applied sequentially between tests, the ampacity decreased only by 1.62

5. Licensing Basis Satisfaction (continued)

#### B. Final

percent, which TVA considers insignificant. The FM tests were performed on power cables arranged in cable trays, uniformly stacked three cables deep, as shown in Detail A of Figure 1. The intent of the cable arrangement was to simulate a 40 percent tray fill (the actual fill was 43 percent) and to have all cables (except the ones located in the corners of the tray) touch other cables on at least three sides. This arrangement essentially eliminates air paths (convection) between the conductors and causes an opposite effect in that there is one heat source surrounded by other adjacent heat sources. For this reason, the tests as performed represent a worst case situation. The 2/0 AMG cables shown in Detail B of Figure 1, represent the same configuration as that tested, in that cables touch each other. The majority of the cables are 2/0 AWG for 6.9-kV service. Again, the coated 3-cable bundles do not touch, except as described above, and the coating provides a conductive path for heat dissipation. Furthermore, the test shows the heat transfer between the tightly packed cables coated with Vimasco and air paths is so good that the coating need not be considered in the design of the cable system.

Based on the above evaluation, TVA concludes that the installed cable configuration, including cable coating, requires no further derating of the cable bundles, and it satisfies the licensing basis.

March 1, 1984 - Nonconformance WBNEEB 8401R2 (EEB 840214 918) identified a significant condition in which documentation was not available to show that Class 1E 6900-volt cable will not exceed its rated maximum continuous copper temperature of 90°C when installed in cable trays and covered with flame retardant coating.

A study (EEB 840203 901) was performed which showed that adequate ampacity exists for cables after derating for the cable coating. Therefore, the licensing bases is satisified.

- 1. Task Force Category 3 for Watts Bar Nuclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Findings: Logic/control drawings do not agree with electrical drawings: F101, F102, F103, F104, F105, F106, F107, F110, F111, F114, F115, F116, F117, F123, F124, F127, F129, F130, F131, F141, F802, F803, F804, F805, F806.
- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1:

- Inadequate drawings/checking of drawings prior to issue.
- Inadequate recognition of need to revise companion drawings during design change process.

Watts Bar unit 2:

- These causes appear to be applicable to Watts Bar unit 2.
- B. Final

Pailure to consistently implement design review procedures as required in EN DES engineering procedure EP 4.25, "Design Review and Interface Coordination of Detailed Construction and Procurement Drawings.

Resp. Org. (AMICED 3 1/4/04 Task Force Concurrence

- 4. Evaluation for Generic Examples
  - A. Preliminary

Problem is generic to logic, control, schematic, and connection drawings throughout WBN Unit 2.

B. Final - To determine generic implications, WBP reviewed the component cooling (70), containment spray (72), and residual heat removal systems (74) to identify mismatches in the logic, schematic, and connection diagrams for those systems. WBP then evaluated the seriousness and important of each mismatch and of the aggregate. Based upon this review, WBP concluded that the present TVA design for all safety systems is fully adequate for correct installation and operation of Watts Bar Nuclear Plant, with two exceptions: (1) instantaneous trip settings of molded case circuit breakers, (2) functional errors on logic diagrams. See Continuation Sheet (page 7).

Resp. Org. Land 3 W104 Task Force Concurrence

- 5. Licensing Basis Satisfaction
  - A. Preliminary

Not satisfied for unit 1 safety systems identified in FSAR section 7 but satisfied for all other systems. This would also apply to the unit 2 licensing basis.

B. Final - FSAR Section 7 identifies functional safety requirements for all safety systems. The licensing bases was not violated for any of the identified Black and Veatch findings in this category. However, the expanded, three system review described in Section 4 revealed licensing problems in two areas: (1) licensing basis was not satisfied for instantaneous trip settings for molded case circuit breakers, (2) licensing commitments were not satisfied for logic diagram functional requirements.

Resp. Org. Common 3/14/44 Task Force Concurrence 2/6 3 V6/84

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    NCR SWP 8267 written on unit 1 (currently nonsignificant) and ECM 3683 only
    address correction of B&V identified drawing errors in the auxiliary feedwater
    system. TVA's Level 1 response to B&V finding F101 does not address all the
    effects of the existence of inaccurate drawings during design, construction, and
    operation. Task force is not aware of any ongoing corrective action on unit 2.
  - B. Final

No ongoing corrective action was in place at the time of the Black and Veatch review.

Resp. Org. Grant 3 V4 64 Task Force Concurrence 246 3 V6 184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

All safety system logic, control, schematic, and connection diagrams need to be reviewed and revised to be consistent with design criteria and each other. As discrepancies are corrected, the impact on internal safety analyses and previous licensing submittals must also be evaluated.

B. Final - WBP initiated the following ECNs to incorporate corrective actions for the findings identified in this category: 3647, 3650, 2816 and 3683. The following FCRs were also accepted from CONST: E3458 and E3508. Additionally, WBP initiated ECNs 4358 and 4360 to correct findings identified in the expanded, three safety review addressed in Section 4. ECN 4667 has been issued to correct logic diagram errors identified in the FSAR logic review, also dexscribed in Section 4, to be completed by March 30, 1984.

Resp. Org. Concurrence 31/6184

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final FCR E3458 Completed (SWP 830125 153); FCR E3508 Completed (SWP 830217 101); ECN 2816 Completed Closure Sheet 95 (SWP 830203 019); ECN 3334 Completed Closure Sheet 101 (WBP 830624 027); ECN 3647 Completed Closure Sheet 103 (WBP 830829 014); ECN 3650 Completed Closure Sheet 103 (WBP 830829 014); ECN 3663 Completed Closure Sheet 101 (WBP 830624 027); ECN 4358 Completed; ECN 4360 Completed Closure Sheet 118 (WBP 840123 507); ECN 4246 Completed Closure Sheet 112 (WBP 831114 521); ECN 4358 Completed; ECN 4360 Completed Closure Sheet 118 (WBP 840123 507); ECN 4246 Completed Closure Sheet 118 (WBP 840123 507); ECN 4246 Completed Closure Sheet 118 (WBP 840123 507); ECN 4246 Completed Closure Sheet 118 (WBP 840123 507); ECN 4246 Completed Closure Sheet 112 (WBP 831114 521); ECN 4667 issued.

Resp. Org. Ames Pp 3W104 Task Force Concurrence 3W184

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

Task force knows of no ongoing programmatic corrective action.

B. Final

Resp. Org. Lesson 3/16/69 Task Force Concurrence 3/16/84

10A. Identification of Corrective Action for Future Work

A. Preliminary

Must be determined by evaluation of cause(s).

B. Final Implementation of engineering procedures training and utilization program initiated by M. N. Sprouse to Those listed dated February 26, 1982 (NEB 820226 255).

## BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

- 4. Evaluation of Generic Examples
  - B. Final (Continued)

WBP has previously addressed instantaneous trip settings on Black and Veatch category 35, including all generic examples and corrective actions. WBP is presently checking all logic diagrams contained in the WBMP FSAR against the appropriate schematic diagrams to identify any additional functional mismatches. This review will be completed by March 30, 1984.

EVALUATION SHEET

Rev. R3 Date 3/9/84

- 1. Task Force Category 4 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Findings:

Failure to design/maintain design records for AFW system as specifically described in the FSAR: F118, F121, F303, F304, F305, F306, F309, F313, F502, F504, F511, F513.

- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1:

- The design control process was not closely linked to FSAR commitments. Watts Bar unit 2:
- This cause appears to be applicable to Watts Bar unit 2.
- B. Final TVA personnel involved in the design process on Watts Bar were not (in all instances) aware of the statements in the FSAR that describe various aspects of the plant's design for which they were responsible. Subsequently, as the Watts Bar design (and concurrent design documentation) evolved, changes in TVA's design (both in design philosophy and physical layout) have not been uniformly reflected in the FSAR via amendments to the docketed description. This assessment is applicable to both units at Watts Bar.

Resp. Org. Halla: 3/16/84 Task Force Concurrence 3/1/84

- 4. Evaluation for Generic Examples
  - A. Preliminary

Given the cause and the base of findings, the situation does not lend itself to a sample approach for bounding the problem to the unit 1 AFW system.

B. Final - B&V findings in this category deal primarily with discrepancies in documentation (actual versus FSAR-described) on the civil engineering design aspects of the Watts Bar AFW system. However, the discrepancies do involve other engineering disciplines (besides civil) and are of a nature such that they could not be described as documentation problems associated only with the AFW system. Therefore, additional sampling of the FSAR statements would not provide an accurate assessment of the scope of discrepancies. This assessment is applicable to both units at Watts Bar.

to both units at Yatts Bar.

Resp. Org. LHChi. 3/16/F/L Task Force Concurrence

- 5. Licensing Basis Satisfaction
  - A. Preliminary

For all examples the unit 2 as well as the unit 1 licensing basis is not satisfied even though there may be no safety significance.

B. Final
Certain findings in this category—F303, F304, F305, F306, F309 and F313—(i.e., location of design documentation) would not impact the licensing basis for Watts Bar. However, other findings—F118, F121, F502, F504, F511 and F513—which involve the application of design/analysis techniques different from that described in the FSAR do not appear to satisfy the plant's licensing basis. This assessment is applicable to both units at Watts Bar.

Resp. Org. Alle 31618 Task Force Concurrence 21/6 319184

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary
Memoranda NEB 821116 265 and NEB 830117 256 represent a valid FSAR correction process
relative to assignment of scope, responsibilities, and timeliness. The criteria for
the actual review are not identified and therefore cannot be determined to be
effective in finding and correcting problems similar to those identified by B&V. The
plan also needs to provide for accountability below the branch chief level.
B. Final

See continuation sheet (page 7)

Resp. Org. LHOh. 3/484 Task Force Concurrence 11/184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 6A should be issued in one document with clear criteria for assessment with respect to either a date or revision level applicable.

B. Final

See continuation sheet (page 7)

Resp. Org. Lifehe 316164 Task Force Concurrence 118 317184

A. Preliminary

B. Finel

EN DES-SEP 83-05, "Verification of Information Presented in Final Safety Analysis Report for Watts Bar Nuclear Plant," was issued August 17, 1983 (NEB 830818 852). This SEP describes EN DES responsibilities for performing a verification of the WBN FSAR to ensure accuracy of existing or completed work.

Resp. Org. & Telife 1 110184 Task Force Concurrence

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Task force is not aware of any action currently directed toward this objective.

B. Final

See continuation sheet (page 7)

Resp. Org. OTCLIFF 5/2/83 Task Force Concurrence VIII 5/5/83

10A. Identification of Corrective Action for Future Work

A. Preliminary

The design control process needs to be revised to provide a positive link to maintenance of an accurate FSAR.

B. Finel

The actions described in section 9% provide the additional controls needed to more closely tie the design control process to the FSAR. This assessment is applicable to both units at Watts Bar.

TVA Task Force for Review of Black & Veetch Findings

BLACK & VEATCH EVALUATION SWEET (Continuation Sheet)

64.

B. Criteria required for performing a formal review of existing FSAR material will be formally provided to the EM DES organizations responsible for validating the accuracy of this information. This criteria will be specific enough to identify discrepancies similar to the type found by Black and Veatch. Formal decumentation of the review work will be required from the responsible organizations (EO); however, accountability below the branch chief/project manager level will not be required in the formal transmittal of new/revised FSAR material to the Nuclear Engineering Support Branch's Nuclear Licensing Section (MED-NLS). Each EO will be responsible for the level of review/accountability for their particular FSAR sections. This assessment is applicable to both units at Watts Bar.

74.

B. The memorandums referenced in section 6A will be superseded by the issuance of an EE DES special engineering procedure (SEP) which will identify (a) the current status (amendment no.) of the FSAR, (b) a division of responsibility (DOR) for reviewing particular FSAR sections to verify present information and/or update as required, (c) criteria to be utilized by the EO in performing this review, and (d) dates for (i) completion of the FSAR review (ii) submittal of formal verification of existing FSAR material accuracy and new/revised FSAR descriptions (reviewed and coordinated as required by EN DES-EP 2.01) to NEE-NLS, and (iii) submittal of all new/revised FSAR material received by NEE-NLS to POWER's Buclear Licensing Staff. This assessment is applicable to both units at Watts Bar.

94.

- B. The following actions taken or to be taken provide the additional assurance required that the FSAR will be more closely linked with the design control process:
  - 1. The DOR for FSAR section being developed as part of the EH DES-SEP discussed in section 7AB will serve to make affected EN DES personnel aware of their responsibility to keep the FSAR section(s) for which they are responsible up to date. The DOR will be maintained in a current status by HEB-HLS and updated as required to reflect changes in section responsibilities and/or organizational realignments.
  - 2. EN DES-EPs 2.01, 2.04, and 2.05 are being consolidated into one EP to clarify the FSAR preparation/revision process within EN DES. When the revised EP is issued, the affected EN DES organizations will be formally notified and concurrently requested to emphasize to their employees the importance of compliance with the procedure.
  - 3. EN DES-EP 4.02 has been revised to require (a) the preparation of data sheets which describe FSAR changes needed as a result of an engineering change notice (ECH) and (b) verification that all required FSAR changes have been sent to MEB-NLS prior to reporting by EN DES that all design work on an ECN has been completed.

This assessment is applicable to both units at Watts Bar.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 12/27/83

- 1. Task Force Corregory 5 for Watta Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Findings: Procurement forms and flow diagrams specified different requirements for various valves: 1) F308, F314, F328, F894, F895, F896, F897; 2) F307; 3) F335, F336.

### 3. Evaluation for Cause

- A. Preliminary Watts Bar unit 1: 1) The design change process requirements apparently did not require that a review of the adequacy of previous procurements be made and documented when design conditions were revised. 2) The drawing preparation process apparently lacks a definitive policy on the manner of presenting design and operating conditions on isometric and flow diagrams. 3) The component qualification process results were not required to be simultaneously tied to the design process and procurement process.
- Watts Bar unit 2: Causes 1) and 2) appear to be applicable to Watts Bar unit 2.

  B. Final 1) and 2) Our normal squadcheck and ECN process requires a review of all items affected by a design change for adequacy. Our flow and isometric diagrams list piping classifications and not actual operating pressure and temperature. Design conditions for the valves are calculated using operating temperatures and pressures. It was never intended that the valves be specified to flow diagram data. Also misuse of of the SI ECN may have contributed to the discrepancies.

  3) As above.

3) As above.

Resp. Org. M. R. Relear / 19184 Task Force Concurrence 1/9/8

## 4. Evaluation for Generic Examples

- A. Preliminary The generic examples could be identified by: 1) Review all safety related EEB procured valves where system design pressure/temperature conditions have changed since procurements to verify consistency of procurement documentation. 2) A review of all interfaces of low pressure, normally idle systems with high pressure normally operating systems for the adequate presentation of design and operating conditions. 3) The examples noted by B&V represented slow documentation of qualification rather than nonperformance of the qualification. Since this was ongoing incomplete work there is no need to identify generic examples. (However, the program control does need some improvement see 10A.)
- B. Final 1) All EEB procured valves were compared to new design pressure/
  temperature conditions using ANSI class rating and no discrepancies were found.
  2) A review of all interfaces was performed and no discrepancies were found.
  3) As above.

Resp. Org. MR Belur 1/9/84 Task Force Concurrence 1/19/84

| 5. Licensing Basis Satisfaction | is Satisfaction |
|---------------------------------|-----------------|
|---------------------------------|-----------------|

- A. Preliminary
  - 1) and 2) Until the evaluations in 4 are completed, the potential exists that the licensing basis was not satisfied. 3) N/A This work was in progress.
- B. Final
  - 1) and 2) All valves and interfaces were checked and found to satisfy the licensing basis. 3)  $\rm H/A$

Resp. Org. 98 Abelan 1 17 184 Task Force Concurrence 21/19184

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    - 1) and 2) WBNEEB 8207 and ECN 3511 address the B&V findings with the following exceptions: F308 and F314. The Task Force is not aware of any corrective actions yet specified. The NCR is not yet applicable to unit 2.
  - B. Final

N/A

Resp. Org. MR Believ 1 19 184 Task Force Concurrence 24 19184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary
    - 1) The generic deviations identified in 4 should be requalified to the current design conditions. 2) The flow diagrams should be revised to accurately and consistently present the design information. 3) N/A No deviations in completed work were substantiated.
  - B. Final

N/A

Resp. Org. 911 Believe / 19184 Task Force Concurrence

Resp. Org. M R Bylew 1/4/84 Task Force Concurrence

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

1), 2), and 3) Task Force is not aware of any action.

B. Final

N/A

Resp. Org. MRB. lun 1/9/84 Task Force Concurrence

10A. Identification of Corrective Action for Future Work

A. Preliminary

1) Policy needs to be established for positive reassessment of procurement affected by design changes. 2) Drawing presentation of design conditions needs to be better specified. 3) The process of requalifying components whose seismic accelerations are analyzed to exceed procurement specifications needs to be formalized and included in the EP system.

B. Final

The engineering procedures in place (ECN, squadchecking, signature, further review) are adequate to prevent recurrence. EP 4.02 has been revised and a memorandum issued by management, controlling the use of the Sl ECN. EP 5.06 has been issued (5-27-80) to control preparation and review of specifications. Together these steps should avoid the concerns identified in step 3A.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R3 Date 3/13/84

- 1. Task Force Category 6 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Findings: Discrepancies between design documents (analysis results, load tables, isometric drawings, design drawings, etc.) used in the design of piping systems: F310, F319, F324, F325, F346, F751, F868.
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1: (1) Regarding findings (F319, F324, F325, F346) the cause stems
    from ineffective handling of interfaces between two analysis (i.e., lap zones). (2)
    The remaining findings appear from the initial evaluation to be random errors in the
    design verification process with no uniquely definable cause.
    Watts Bar unit 2: These causes appear applicable to Watts Bar unit 2.
  - B. Final
    WBN unit 1: Regarding findings F319, F324, F325, and F346 the cause stems from:
    (la) ineffective handling of the interface region between two analyses and (lb)
    errors related to the use of the -ANCHOR program. (2) The remaining findings
    were determined to be random individual errors in the design process with no
    uniquely identifiable cause. The errors if uncorrected would not result in a
    failure of the piping pressure boundary or loss of system function. No additional
    evaluation is required. (See Continuation Sheet, page 7)
    Resp. Org. 72 (1844)
- 4. Evaluation for Generic Examples
  - A. Preliminary
    - (1) The scope of the evaluation for generic examples should include a review of all lap zones in Watts Bar unit 2. (2) The determination of generic examples will be made after the cause and effects of the individual findings are evaluated.
  - B. Final

(la, lb) The scope of the evaluation for generic examples should include a review of all rigorous analyzed lap zones and anchors (effected by the -ANCHOR program) in WBN unit 1. (2) No further evaluation is required, see 3.B.(2) above.

(1a, 1b) A review indicates that a maximum of 80 problems may require revisions due to lapping deficiencies. All skewed anchors which were analyzed using the direction cosine option in question will be reanalyzed.

Resp. Org. R Grand 3 1/5/84 Task Force Concurrence 3 1/6/84

| 5. | Licensing | Basts | Satisfaction |
|----|-----------|-------|--------------|
|----|-----------|-------|--------------|

### A. Preliminary

(1) The licensing bases for the unit 1 findings are not satisfied. (2) The determination of whether or not the licensing basis for the remaining unit I findings are satisfied will be made after the findings are evaluated. Items (1) and (2) would aiso apply to unit 2 licensing basis.

#### B. Final

(la, lb) The licensing basis for these findings is not satisfied. (2) The licensing basis is satisfied.

Resp. Org. 72 June 3/0784 Task Force Concurrence

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary (1) USNRC NUREG/CR-1980 addresses lapping in piping analyses. Also corrective action is in progress in response to unresolved Item 390/82-27-09 per NRC letter D.M. Verrelli to H. G. Parris dated September 10, 1982 and unit 1 NCR's WBMCEB 8233, WBNSWP 8309, WBNSWP 8312, WBNCEB 8232. This appears to be an adequate approach to unit 2 but the task force has not fully evaluated the corrective actions. (2) No corrective action is identified for this group of findings.

B. Final

(la) NCR WBNCEB8232 specifically addresses finding F346 for units 1 and 2. All lapped regions are being reviewed and corrections are being made to piping analysis and support design as required. Unresolved item 390/82-27-09 is being investigated and the correctness of the WBN lapping techniques is being verified. Criteria has been issued in the rigorous analysis handbook. This correction is judged adequate. (See Continuation Sheet, page 7.)

Resp. Org. 72 Guin 3/15/84 Task Force Concurrence

# 7A. Identification of Corrective Action for Completed Work

A. Preliminary

(1) Resolve differences in lap zones analyses and results and any designs resulting therefrom. (2) All findings not identified in 3.A.1 shall be evaluated to determine wnether or not the affected piping systems can be use-as-is if the conditions found by B&V were not corrected. This information will be used to determine if identification of other generic examples are required.

### B. Final

(la, lb) The plan in 6A.B. appears adequate. (2) Not applicable. No corrective action is required for unit 2.

Resp. Org. 7 Line 107ge Task Force Concurrence 216184

- &A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final (la) A review has indicated that a maximum of 80 problems may require revisions due to lapping deficiencies. It has not been determined how many of these problems will require reanalysis. This reanalysis effort is expected to be completed by 12/30/84. The effort is being tracked through NCR WBNCEB8221. The WBM lapping criteria has been verified by EDS (IMPELL) as being correct. (1b) All affected anchor load tables will be reissued. The expected completion date is 4/1/85. This effort is being tracked through NCR GENCEB8302. (2) Not applicable. Resp. Org. 72 Lange 3/45/74 Task Force Concurrence
- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary (1) USNRC NUREG/CR-1980 addresses lapping in piping analyses. Also corrective action is in progress in response to unresolved Item 390/82-27-09 per MRC letter D.M. Verrelli to H. G. Parris dated September 10, 1982 and unit 1 HCR's WHMCES 8233, WBHSWP 8309, WBNSWP 8312, WBNCEB 8232. This appears to be an adequate approach to unit 2 but the task force has not fully evaluated the corrective actions. (2) No corrective action has been identified for this group of findings.

B. Final

(la) As discussed in 6A.B the lapping criteria has been issued in the rigorous analysis handbook. (1b) As discussed in 6A.B the -ANCHOR program has been modified, the output has been modified, and the owners manual has been modified. (2) No further corrective action is required.

Resp. Org. 72 Comments Task Force Concurrence 2 16184

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary
  - B. Final

The action identified in 9A.B appears to be adequate.

Resp. Org. Telini 3/05/84 Task Force Concurrence 26/184
