Director of Nuclear Reactor Regulation

Attention: Ms. E. Adensam, Chief

Licensing Branch No. 4

Division of Licensing

U.S. Nuclear Regulatory Commission

Washington, D.C. 20555

Dear Ms. Adensam:

In the Matter of the Application of Tennessee Valley Authority

Docket Nos. 50-390 50-391

By letter dated May 30, 1985, the NRC requested information related to the Black and Veatch Independent Design Verification Program at Watts Bar Nuclear Plant. The enclosure to that letter consisted of five questions. The purpose of this letter is to provide a response to those five items.

Accordingly, the enclosure to this letter provides responses to the questions contained in the referenced letter. Due to the bulk involved, the attachments which are referenced in the enclosed responses were provided directly to NRC under separate cover on June 11, 1985.

If you have any questions concerning this matter, please get in touch with R. H. Shell of may staff at FTS 858-2688.

Very truly yours.

ENCLOSURE
WATTS BAR NUCLEAR PLANT
RESPONSE TO QUESTIONS OF THE MAY 30, 1985,
NRC REQUEST FOR ADDITIONAL INFORMATION
ON THE BLACK AND VEATCH INDEPENDENT REVIEW

Question 1

TVA stated in a September 9, 1982 letter that the Black and Veatch (B&V) "confirmation of the adequacy of auxiliary feedwater (AFW) system will be compiled with broader, more comprehensive programmatic reviews (e.g., the Nuclear Safety Review Staff (NSRS) review of Watts Bar Nuclear Plant (WBN), United Engineers' design verification program review, Theodore Barry and Associates (TB&A) review of TVA's Office of Engineering Design and Construction (OEDC), etc.) to provide TVA with additional confirmation that WBN is, in fact, designed and constructed adequately even though deficiencies in the quality assurance program have been identified and resolved."

Documentation received to date does not indicate that the other reviews were relied upon in reaching your conclusions regarding the adequacy of the WBN. Therefore, we request that you provide your compilation of all these reviews which demonstrates your conclusions regarding how the WBN facility meets its licensing commitments. In addition, we ask that you submit those reports identified in your September 9, 1982 letter as well as any others you may have included in your evaluation.

Response

During the latter part of 1978, TB&A made a management performance review of OEDC. A copy of the one-volume report issued in December 1978 is provided in attachment 1. The review resulted in 115 recommendations to OEDC. These recommendations were assigned to managers in the OEDC organization and each was individually addressed.

During early 1980, TB&A performed a review of the OEDC implementation of progress on the 115 recommendations. The report dated February 1980 is a very good summary of the OEDC implementation. At that time some items were still in the process of being addressed. A second follow-up review of the OEDC implementation progress was performed early in 1981. The report dated March 1981 provides a final status on these recommendations as evaluated by TB&A. At the time of the second follow-up review, TB&A found that OEDC had implemented, or was in the process of implementing, 107 of the 115 recommendations. Some of the remaining 8 recommendations, such as assigning an overall OEDC project manager for each nuclear plant, were subsequently implemented. Some recommendations concerning responsibilities for licensing involved other offices within TVA and were never implemented. These three reports issued by TB&A management consultants give a good summary of their recommendations and the OEDC implementation. Copies of these follow-up reports are also provided in attachment 1.

Question 2

Discussions with your staff indicate that the TVA task force prepared evaluation sheets for the task force categories addressing the (B&V) findings. We request you submit those evaluation sheets for staff review.

Response

The evaluation sheets are provided with the response to question 4.

Question 3

Provide all internal TVA correspondence pertaining to the NSRS review of the B&V report, and the dispositions of their findings and recommendations. Does the NSRS concur with the final disposition of their recommendations? If not, provide reasons for non-concurrence and TVA's justification for closure of the item.

Response

NSRS participated in the B&V review through H. N. Culver, Director of NSRS. He was a member of TVA's policy committee for B&V. The policy committee was composed of senior TVA managers and charged with acting on the B&V finding and supplying information to B&V on the finding. The policy committee established and directed the task force (see question 2) that reviewed the B&V findings for generic applicability to WBN systems other than AFW. The October 7, 1982 memorandum establishing the policy committee with Mr. Culver as a member is provided in attachment 2.

Also provided in attachment 2 are 11 internal TVA memorandums documenting meetings of the B&V policy committee.

Mr. Culver's attendance is noted in the minutes. He participated actively in the functioning of the committee and the deliberations of the committee.

In addition to participating in the meeting that is documented, there was frequent contact between the chairman of the policy committee and the individual members of the policy committee. During these contacts the chairman would obtain advice and consent on TVA responses to level II B&V findings. Mr. Culver was a key resource in this endeavor.

The evaluation of the B&V review and the review for generic applicability to WBN was the responsibility of the policy committee. Mr. Culver and J. W. Anderson, Manager of Quality Assurance, were both deeply involved in the preparation, drafting, and review of the report of this generic evaluation. The report was submitted to NRC on March 29, 1984 by D. S. Kammer's letter to Ms. Adensam. The signatures on the cover of that report, including Mr. Culver's, attest to the policy committee's review and approval of the report.

Attachment 3A - This attachment provides corrective actions (NCRs, engineering change notices (ECNs), field change requests (FCRs), and commitment tracking records) identified as the result of the B&V findings. We have not included those for the corrective action which was documented as complete and included in the B&V reports.

The contents of attachment 3A are listed below:

Nonconformance Reports	Engineering Change Notices
WBNEEB8104 WBNCEB8204 WBNEEB8208 GENCEB8213 WBNCEB8215 WBNCEB8222R1	2576 3198 3210 3306 3507

GENCEB8302 WBNSWP8305 WBNSWP8309 WBNSWP8312	H-8236 H-8404 H-8721
WBNEEB8401	Commitment Tracking Records WBN-R189 WBN-R190 WBN-R266

Attachment 3B - This attachment provides documentation of completed corrective action identified during accomplishment of the task force generic evaluation. This documentation includes corrective action for past and future work.

Part 1 of attachment 3B contains a copy of the task force report (EDC 840320 402). The report explains the task force objectives and methodology and contains the 25 category evaluation sheets. Each category evaluation is complete except for item 12A/B ("Verification of Effectiveness of Corrective Action for Future Work"). The responsibility for completing this item was assigned to the Quality Management Staff (QMS).

Part 2 of attachment 3B contains a package of information for each category. Each package includes:

- a copy of the completed evaluation sheets including item 12A/B completed by ${\sf QMS}$,
- QMS surveillance report for the assessment of item 12A/B for each category,
- documentation (including modified procedures) to verify the accomplishment of corrective action for past and future work identified for each category.

ENCLOSURE
WATTS BAR NUCLEAR PLANT
RESPONSE TO QUESTIONS OF THE MAY 30, 1985,
NRC REQUEST FOR ADDITIONAL INFORMATION
ON THE BLACK AND VEATCH INDEPENDENT REVIEW

Question 1

TVA stated in a September 9, 1982 letter that the Black and Veatch (B&V) "confirmation of the adequacy of auxiliary feedwater (AFW) system will be compiled with broader, more comprehensive programmatic reviews (e.g., the Nuclear Safety Review Staff (NSRS) review of Watts Bar Nuclear Plant (WBN), United Engineers' design verification program review, Theodore Barry and Associates (TB&A) review of TVA's Office of Engineering Design and Construction (OEDC), etc.) to provide TVA with additional confirmation that WBN is, in fact, designed and constructed adequately even though deficiencies in the quality assurance program have been identified and resolved."

Documentation received to date does not indicate that the other reviews were relied upon in reaching your conclusions regarding the adequacy of the WBN. Therefore, we request that you provide your compilation of all these reviews which demonstrates your conclusions regarding how the WBN facility meets its licensing commitments. In addition, we ask that you submit those reports identified in your September 9, 1982 letter as well as any others you may have included in your evaluation.

Response

During the latter part of 1978, TB&A made a management performance review of OEDC. A copy of the one-volume report issued in December 1978 is provided in attachment 1. The review resulted in 115 recommendations to OEDC. These recommendations were assigned to managers in the OEDC organization and each was individually addressed.

During early 1980, TB&A performed a review of the OEDC implementation of progress on the 115 recommendations. The report dated February 1980 is a very good summary of the OEDC implementation. At that time some items were still in the process of being addressed. A second follow-up review of the OEDC implementation progress was performed early in 1981. The report dated March 1981 provides a final status on these recommendations as evaluated by TB&A. At the time of the second follow-up review, TB&A found that OEDC had implemented, or was in the process of implementing, 107 of the 115 recommendations. Some of the remaining 8 recommendations, such as assigning an overall OEDC project manager for each nuclear plant, were subsequently implemented. Some recommendations concerning responsibilities for licensing involved other offices within TVA and were never implemented. These three reports issued by TB&A management consultants give a good summary of their recommendations and the OEDC implementation. Copies of these follow-up reports are also provided in attachment 1.

Question 2

Discussions with your staff indicate that the TVA task force prepared evaluation sheets for the task force categories addressing the (B&V) findings. We request you submit those evaluation sheets for staff review.

Response

The evaluation sheets are provided with the response to question 4.

Question 3

Provide all internal TVA correspondence pertaining to the NSRS review of the B&V report, and the dispositions of their findings and recommendations. Does the NSRS concur with the final disposition of their recommendations? If not, provide reasons for non-concurrence and TVA's justification for closure of the item.

Response

NSRS participated in the B&V review through H. N. Culver, Director of NSRS. He was a member of TVA's policy committee for B&V. The policy committee was composed of senior TVA managers and charged with acting on the B&V finding and supplying information to B&V on the finding. The policy committee established and directed the task force (see question 2) that reviewed the B&V findings for generic applicability to WBN systems other than AFW. The October 7, 1982 memorandum establishing the policy committee with Mr. Culver as a member is provided in attachment 2.

Also provided in attachment 2 are 11 internal TVA memorandums documenting meetings of the B&V policy committee.

Mr. Culver's attendance is noted in the minutes. He participated actively in the functioning of the committee and the deliberations of the committee.

In addition to participating in the meeting that is documented, there was frequent contact between the chairman of the policy committee and the individual members of the policy committee. During these contacts the chairman would obtain advice and consent on TVA responses to level II B&V findings. Mr. Culver was a key resource in this endeavor.

The evaluation of the B&V review and the review for generic applicability to WBN was the responsibility of the policy committee. Mr. Culver and J. W. Anderson, Manager of Quality Assurance, were both deeply involved in the preparation, drafting, and review of the report of this generic evaluation. The report was submitted to NRC on March 29, 1984 by D. S. Kammer's letter to Ms. Adensam. The signatures on the cover of that report, including Mr. Culver's, attest to the policy committee's review and approval of the report.

Attachment 3A - This attachment provides corrective actions (NCRs, engineering change notices (ECNs), field change requests (FCRs), and commitment tracking records) identified as the result of the B&V findings. We have not included those for the corrective action which was documented as complete and included in the B&V reports.

The contents of attachment 3A are listed below:

Nonconformance Reports	Engineering Change Notices
WBNEEB8104	2576
WBNCEB8204	3198

Attachment 3B - This attachment provides documentation of completed corrective action identified during accomplishment of the task force generic evaluation. This documentation includes corrective action for past and future work.

Part 1 of attachment 3B contains a copy of the task force report (EDC 840320 402). The report explains the task force objectives and methodology and contains the 25 category evaluation sheets. Each category evaluation is complete except for item 12A/B ("Verification of Effectiveness of Corrective Action for Future Work"). The responsibility for completing this item was assigned to the Quality Management Staff (QMS).

Part 2 of attachment 3B contains a package of information for each category. Each package includes:

- a copy of the completed evaluation sheets including item 12A/B completed by QMS,
- QMS surveillance report for the assessment of item 12A/B for each category,
- documentation (including modified procedures) to verify the accomplishment of corrective action for past and future work identified for each category.

Reference: Memorandum from Sprouse to me dated 9/14/82 (NEB 820914268):

" OCT 7 198

₽१∨

The referenced memo reported arrangements that have been made for OEDC to review Black and Veatch findings. This level one review by TVA will be after the initial review by Black and Veatch. A second review by TVA may be desirable after Black and Veatch reviews the findings taking into consideration TVA's input from the level one review. You are well aware that the results of this independent review are most important to the licensing of Watts Bar and will have very high visibility. In reaching their conclusion, Black and Veatch should have the best information available. I consider it very important that you have the opportunity to express your personal views on each of the findings where your views are relevant to their reaching the correct conclusion.

We have arranged for Black and Veatch to submit to OEDC each finding after the second review is performed by the assistant project manager in Knoxville. We must use the opportunity that exists during this submittal to express any personal views you feel relevant. In addition, there will probably be times when it is important that we meet as a body and consider expressing views on particular findings or situations.

I am naming a policy committee to be available as necessary to act on findings as a body and to supply information to Black and Veatch on findings which merit this level of attention. In addition, each of you as a member of this policy committee will be given the opportunity to comment on the findings. I have asked E. G. Beasley to serve as chairman of this committee and the following persons will serve as members:

J. W. Anderson, Manager of Quality Assurance; R. M. Pierce, Watts Bar Project Manager, OEDC; H. H. Mull, Manager of Construction; M. N. Sprouse, Manager of Engineering Design; and H. N. Culver, Director of NSRS.

WATTS BAR MUCLEAR PLANT - COURT REVIEW BY BLACK

DATE November 3, 1982

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

As DEDO seceives each of the Book and Castch Finder

Reference: G. H. Kimmons memo, to Those, listed, 10/7/82 (EDC 821007,005)

The Watts Bar Independent Review Policy Committee met on November 2: 2: 2: 2 1982. Members present were J. W. Anderson, H. N. Culver, H. H. Mull, R. M. Pierce, M. N. Sprouse, and E. G. Beasley; others present were R. W. Cantrell, H. L. Jones, D. R. Patterson, and J. A. Raulston.

The present status of the Black & Veatch review was reported. As of November 2, 184 findings have been transmitted to TVA. To date, TVA has responded to 32 of these findings on the Level 1 review and to 9 on the Level 2 review. Of the 184, 111 were classified as open; 59 were classified as confirmed; and 14 were classified as resolved that it

Examples of findings were presented to show the typical spectrum of findings. Examples included: findings of important concerns; findings of nil technical or regulatory concern; findings where FSAR commitments were not met; findings where something was done that was not spelled out in the FSAR; findings where the actual field installation was not in accordance with design drawings; and identical findings on separate pieces of equipment. H. C. Parris, 500A CUBB-C

The committee discussed several possible immediate actions which will enable TVA and B&V to deal with the findings effectively and expeditiously. It was agreed that:

- o We would formally increase the TVA review time from 2 working days to 7 working days. This increase in time is both applied to Level 1 and Level 2 reviews.
- o We would suggest to B&V that they consider grouping similar findings such that the group can be tracked as a package. If B&V does this grouping, we would prefer it be done prior to the Level 2 submittal so that TVA could be aware of the grouping.
- o Many of the findings could be related to situations where TVA work is still in progress. It was agreed that the Program Manager would instruct the responsible reviewers to be certain to identify all cases where the finding refers to work still in progress.

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE and said

sther audicalonal raview trans "I" " will be formally by possibly blad - privates blad - privates blad - privates could be and their achience bear station of the configuration o

Reference: G. H. Kimmons memorandum to Those Listed dated October 7, 1982 (EDC 821107 005). redesered as 230 MS mi bos 2 redmeyoN as

The Watts Bar Independent Review Policy Committee met on December 2, 1982. Members present were: J. W. Anderson, H. N. Culver, H. H. Mull, R. M. Pierce, M. N. Sprouse, E. G. Beasley. Others present were: R. W. Cantrell, H. L. Jones, D. R. Patterson and J. A. Raulston.

Attachment 1 is an agenda for the meeting. Attachment 2 is the first page of a tracking log which I maintain. Item 1 of the agenda was a brief status of the overall independent review effort.

Agenda item 2 was discussed at length. The possibility of meeting with B&V on findings where there is a technical diagreement between B&V and TVA was discussed. It was agreed to not consider such meetings at this time. Where there is a technical disagreement the level 2 response will elaborate on the TVA position and the appropriate branch chief or comparable position will be requested to concur on the level 2 response. In addition, the level 2 response will request B&V to recycle the finding if the finding is not recategorized as resolved.

Under agenda item 3 it was noted that we had approximately 25 findings where B&V had identified an inconsistency between TVA drawings such as between the logic diagram and the connection diagram. It was agreed that responses to the level 1 finding would confirm the finding if it was fact, note whether or not the installation was correct, and cite the NCR, ECN, or FCR being used to bring the drawings into agreement.

It was also agreed that NEB would draft a generic response to use on level 2 findings of this nature. The wording on these items is extremely sensitive and the program manager should work through the grouphead and branch chief where it is difficult in getting a level 1 response that is properly worded.

Identification of conditions adverse to quality was considered under agenda item 4. It was reiterated that we would adhere closely to the engineering procedures and PRM and issue NCRs where appropriate. H. L. Jones as program manager has the authority while making the level 1 review to request the team member to reconsider where it appears that the NCR procedures were not being followed.

B&V classify each finding as open, resolved or confirmed. They now classify as resolved findings that identify minor discrepancies such as typos and findings of minimum consequence. The resolved category is also being used for findings for items where installation, inspection, and documentation are not complete.

OEDC MO Files December 6, 1982

POLICY EC WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

Twenty-eight level 2 findings have been classified as confirmed. Additional information may result in some of these findings being classified as resolved. A few findings have been identified where the design and construction are not consistent with the license application. states

-- SAPT IS MESSIT

2620 0035 On findings where installation, inspection and documentation are complete, B&V is to classify as resolved and identify as item on a punchlist. When TVA receives this punchlist, it will be compared to the accountability program to assure the B&V punchlist item is in the TVA system, then the item or punchlist not tracked further as a B&V item.

Tehniosi Disagrasaest Where TVA commits to some action other than the B&V punchlist on incomplete items the corrective action will be tracked as an NCR, ECN or FCR. If an NCR. ECN or FCR is not appropriate then a CTR will be issued and tracked to closure. The NCR, ECN, FCR and CTR will be identified by number in the OEDC log and the log maintained as a record.

It was noted that informal discussion with B&V had indicate the earliest possible date for the final report as January 15. The January 15 date is based on all level 1 responses being back to B&V by December 7. While there is a concern for the schedule, it was agreed that quality responses take precedent over schedule. Goals of December 10 and December 17 ware set for all level 1 responses being in the hands of the program manager and returned to Black and Veatch, respectively.

Construction (Quality and Nuclear Safety), W12A6 C-K

DATE

December 28, 1982

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

Reference: G. H. Kimmons' memorandum to Those listed dated October 7, 1982 (EDC 821007 005).

The Watts Bar Independent Review Policy Committee met on December 17, 1982.

Members present were: J. W. Anderson, H. N. Culver, H. H. Mull, R. M. Pierce,
M. N. Sprouse, and E. G. Beasley. Others present were: R. W. Cantrell,
H. L. Jones, R. A. Pedde and J. A. Raulston.

The log of B&V findings status was distributed; that log was current as of December 17. A summary status sheet (Attachment 1) was discussed by H. L. Jones. There was general discussion concerning the delays in responding in both level 1 and level 2 findings. Both EN DES and CONST indicated they expect to clear all level 1 responses during the week of December 20.

H. L. Jones reported that in a recent telecon with B&V that B&V had indicated that we should anticipate receiving the final report near the end of March. This March date is based on past trend rates for handling the finding. By TVA getting all responses to B&V by December 17 and an accelerated rate on both the part of TVA and B&V it may be possible to get the report out by the end of February (all level 1 responses were not in by December 17, 1982). There was no strong concern expressed about the March date for the final report; even though there was considerable concern on the timeliness of handling the individual items.

OQA's concerns expressed in McDonald's memorandum to Jones and Kidd were discussed (see Attachment 2). It was agreed that corrective action would be taken on all B&V findings where there is a discrepancy even though the finding may be categorized as "Resolved" by B&V. OQA also identified some programmatic concerns relative to the findings. It was agreed that these concerns would be resolved within OEDC-OQA without involving B&V.

Two proposed level 2 responses to finding 504 were considered (see Attachment 3). After general discussion it was agreed that where there is a specific deviation from a FSAR commitment the level 2 response will acknowledge that the design and construction did not agree with the license and that we would attach general information explaining the importance of the deviation to nuclear safety.

It was also noted that F504 resulted in a significant NCR that was determined to be nonreportable based on the importance to nuclear safety. It was generally agreed to not give specific consideration to reportability even though there was a direct violation of a FSAR commitment.

OEDC MO Files December 28, 1982

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

A proposed response to F507 (Attachment 4) was discussed. There were strong feelings that we should not constrain B&V by responding as proposed. The attached level 2 response was withdrawn and the F507 returned to SWP and CEB to gather the EDS information B&V requested.

In the previous policy committee meeting the committee asked NEB to draft an attachment to use on level 1 responses where the finding identified a discrepancy between the detailed design drawing and the criteria drawing. A copy of the NEB effort is included as Attachment 5. Persons present were requested to forward any comments to NEB by 8 a.m. on December 21. NEB and H. L. Jones will then use the attachment for the appropriate level 1 responses.

MADE CLEET

WBN INDEPENDENT REVIEW SUBJECT:

> I selected a random sample of 18 Black & Veatch (B&V) findings on the WBN AFW system which had their categories changed from "O" to "R" subsequent to OEDC feedback. My review of the paperwork indicated that 6 of these 18 should have remained "O" as asterisked below:

*100	*111	328	337	500	769
*104	*115	329	338.	501	*777
*106	139	331	356	505	795

From this sample, the areas I feel we and/or B&V are not being sensitive to are:

- o Uniform accuracy of the drawing control system to support the operating phase activities (design and operation) not just construction activities. (F-104, -106, -111, -115)
- o Quality achievement in construction. Inspection is only one element of quality assurance. Our program has not worked if the item is constructed so as to We have ted Annual not meet design requirements. (F-777)

I recommend that OEDC pay close attention to all Rs and when appropriate continue to characterize them as valid findings.

From my conversations with you on December 8 and 9, I believe my concern is shared by and will be pursued by you. I plan to followup this galler concern after the issuance of the next level TVA response to B&V.

An Expended Discussion of Black & Veatch Finding F504

The Commitment Defined

Section 3.7.2.1.1 of the Watts Bar Final Safety Analysis Report (FSAR) makes the following statement: "For axisymmetric structures, an eccentricity of 5 percent of the diameter was assumed." An explanation follows.

Consider a cylindrical containment vessel with a spherical dome, as shown in figure 1. It is nominally symmetric about its central vertical axis. To meet the commitment, the analyst would assume an arbitrary offset (equal to 1/20th of the diameter of the structure) of the center of mass, M, from the center of the structure, C. Since the mass is then eccentric to the center of twisting (known as the shear center), base ground motion (such as an earthquake) along the + and - y axes in figure 1 will induce both lateral shear forces and torsion in the structure. The eccentric mass will also result in the formation of vibration modes involving simultaneous (or coupled) translational and rotational motion.

The intent of this commitment was to account for asymmetry due to:
(1) construction tolerances and (2) eccentric mass distribution of supported subsystems (such as piping, hatches, ladders, etc.). The historical source of the 5-percent figure (e.g., why not 1 percent or 2 percent?) is the uniform building code (UBC). In commercial buildings designed by the UBC, the potential for eccentricities in mass center due to asymmetric floor loadings and shifts in shear center due to the effects of interior walls is much greater than for nuclear containment structures.

The Watts Bar Steel Containment Vessel Seismic Analysis

Rather than apply the arbitrary 5-percent eccentricity, the analyst calculated <u>actual</u> eccentricies at various levels of the structure. The most significant of these were due to hatches, although, at most, the eccentricities are equal to approximately 1 percent of the diameter. Thus, part 2 of the intent of the commitment was met. TVA has considerable data supplied by the designer and constructor of the vessel (Chicago Bridge and Iron Company) to show that the structure has insignificant additional eccentricity due to construction tolerances.

The Effect of Not Meeting the Commitment

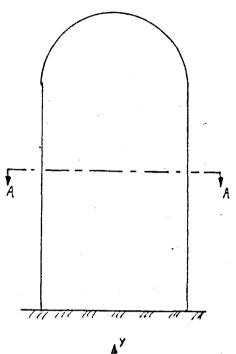

In those instances where TVA has used 5-percent eccentricity on cylindrical structures, the effect has been shown to be small. One way of expressing the effect of including the 5-percent eccentricity is to compare the motion of a point on the shell (shown as "+R" in section A-A, figure 1) to the motion of the center of the cylinder, C. If the torsional effects are significant, the motion of these two points will be signicantly different. Figure 2 is a response spectrum plot of these two points for the seismic

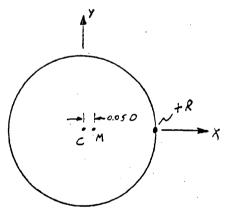

analysis of the Bellefonte Nuclear Plant secondary containment structure. (It is a plot of the peak acceleration of subsystems of various frequencies attached to the structure.) Since the two points have almost identical response spectra, the effect of considering the 5-percent eccentricity is seen to be small.

This effect should be even less for the Watts Bar Nuclear Plant containment vessel, since its first torsional vibration mode is at approximately 15 hertz (cycles per second), compared to the 10 hertz coupled torsional-translational mode for the Bellefonte secondary containment and since there is considerably less seismic ground motion input at 15 hertz than at 10 hertz.

Summary

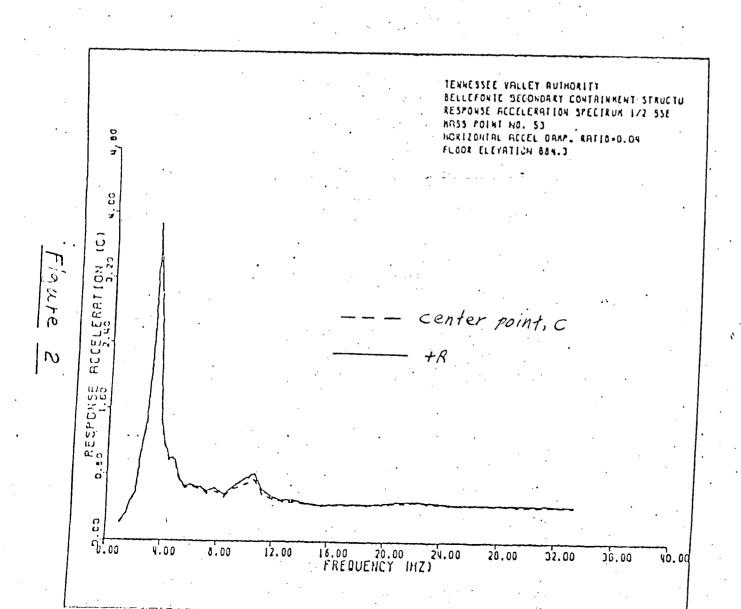

- 1. The FSAR commitment was not met.
- 2. The original intent of the FSAR commitment was met.
- 3. The effect of not meeting the FSAR commitment is minimal.

WATTS BAR NUCLEAR PLANT INDEPENDENT REVIEW

FINDING RESPONSE

Date finding received from Black & Veatch

Date

Date

Finding number /F/5/0/7/

Comments pertinent to finding:
With respect to contractors, vendors, and suppliers, it is TVA's understanding that the B&V independent review is limited to review of the interfaces with contractors, vendors, and suppliers. This review of the interface is to confirm that the requirements, data and information supplied to TVA was correctly incorporated in the design and construction of the auxiliary feedwater system.
It was not necessary to review Westinghouse detailed calculations that established the auxiliary feedwater flow rate. It was only necessary to confirm that TVA had designed and constructed the auxiliary feedwater system to deliver the flow rate which was a commitment in the FSAR.
Similiarly, the Black & Veatch review need only to confirm that TVA gave EDS the proper data and that the results EDS submitted to TVA were correctly incorporated in the design.

Date finding response transmitted to Black & Veatch

IDENTIFICATION OF DRAWING DISCREPANCIES

Discrepancies between conceptual and detail drawings which are significant to the system's operation and which have not been found and corrected during design and installation have a high probability of being discovered and resolved in the review and testing associated with construction testing and preoperational testing. This is explained in the following.

Construction Testing

Construction testing activities prior to transfer of the system from CONST to NUC PR would detect certain types of design errors which would cause the components of the system to function improperly.

The construction test program demonstrates that tested structures, systems and components will perform satisfactorily when preoperationally tested and put into service. This construction test program concentrates on the verification that the installed "system" as well as the "element" will function properly. The construction tests are performed on systems and components of unlicensed nuclear units to satisfy prerequisites to the preoperational test program. These include pressure and other integrity tests, component, and piping system cleaning and flushing, equipment checkout, and initial operation and adjustments.

Construction conducts the tests with the assistance and support of NUC PR, and prepares a test results package containing all collected test data. This test package if reviewed by CONST QA, the responsible engineer, and the designer and NUC PR as appropriate. The validity and acceptance of the test is verified, and the test results package becomes a QA document, which is filed in the Quality Control Records Unit.

If a drawing discrepancy is discovered during construction testing, then a Nonconformance Report (NCR) and/or Field Change Request (FCR) is initiated by CONST. NCRs originated because of drawing discrepancies will be referred to EN DES for resolution with entries indicating CONST's recommended disposition. These NCRs are transmitted from the CONST project manager to the EN DES project manager. The EN DES project manager transmits the NCR to the appropriate group in design to be dispositioned. Following a technical review of the conditions described by the NCR form, EN DES will either concur with CONST's recommended disposition or will issue a revised disposition.

The FCR process is described in the section on change control.

Preoperational Testing

The preoperational testing program for systems important to safety should detect design errors that may not be evident during construction testing, but would otherwise prevent proper operation of the system.

The preoperational testing program verifies that the plant systems and features important to nuclear safety meet an established set of acceptance criteria and prove these systems and features can perform their intended safety functions as designed.

Prior to preoperational testing, the test record drawings are reviewed by CONST, EN DES, and NUC PR. The test record drawings typically include the detailed construction drawings, the instrument tabulation drawings, and the more comprehensive flow and control drawings (and often the logic drawings as well). The "as-constructed" status of these drawings at the time of preoperational testing are prepared by CONST (using either drawings already under configuration control or specially reviewed to show the construction status) and reviewed by the EN DES test representative to assure that the "as-constucted" system is appropriate for testing. The EN ES test representative who is responsible for this evaluation is generally from the branch or project which has engineering or design responsiblity for the system or feature being tested. If there are drawings outside of his area of expertise, the test representative is responsible to see that proper review is given to those drawings by design engineers who are knowledgeable in that subject. At the conclusion of testing the NUC PR test director verifies that the test record drawings were those used in the conduct of the test.

The data taken during testing is collected in a test results package. The test results package consists to the issued preoperational test instruction with each signoff point signed and dated to verify the actions taken, all data sheets, instruction change sheets, test

deficiencies and exceptions, appendices, a daily log of the testing, and the test record drawins which document the configuration of the plant features at the time of testing.

Drawing discrepancies which would cause the system to deviate in the test from its designated performance would be detected in the performance and review of the preoperational test and identified as preoperational test deficiencies.

During testing as test deficiencies occur, NUC PR transmits to EN DES a test deficiency report. This allows EN DES to expeditiously take whatever action is required to resolve the deficiency and to allow retesting if necessary to demonstrate acceptable performance. The test deficiency is formally documented in the test results package which includes a description of the deficiency, a copy of the report form, and the resolution of the deficiency.

When the testing is completed and the results package has been compiled, NUC PR evaluates the results and identifies any items which still require resolution. The package is then transmitted to EN DES. EN DES reviews the complete results package to verify that the testing performed demonstrated that the system or feature is functioning as designed and that the acceptance criteria were met. As a part of its review, EN DES evalutes any open items identified by NUC PR and establishes an acceptable schedule for determining the resolution of these items and for implementation of the resolution. The preoperational test is not completed until EN DES has given final

approval to the results package. Additional information on the preoperational test program is given in EN DES-EP 6.01, "Preoperational Testing Documents - Processing," and ID-QAP-11.1, "Preoperational Testing."

Change Control

The design change control process includes procedures for processing of Field Change Request (FCRs) initiated by the Division of Construction. The FCR process is typically utilized to provide timely resolution of minor construction problems related to interferences, tolerance adjustments, minor drawing discrepancies, etc. The scope of exhanges which can be processed via the FCR process is strictly limited to ensure that changes are properly controlled. The FCR process involves the responsible construction engineering unit initiating the FCR and contacting the responsible design engineer in the EN DES design project. The design engineer has the authority to verbally approve or disapprove the change request. The design engineer also has the authority to request more information, such as marked up drawings, sketches, etc., if he feels this is required to reach a proper decision. If approved, the construction engineer proceeds to implement the change and submits the FCR package, including agreed to sketches or drawings, to the EN DES design project for incorporation into a future drawing revision.

In addition to the ECN and FCR processes, TVa utilizes a Design Change Request (DCR) process whereby plant operational personnel from the Division of Nuclear Power (NUC PR) can request changes to the issued

design. Typically, plant operations personnel are not actively involved during the development of detailed design and only become involved during the operator training cycle and during preoperational testing. This process provides a mechanism for plant staff and operations personnel to initiate changes which they feel would improve plant operability or which would corrrect design discrepancies. Once a DCR is approved, an ECN is initiated to control and implement the change.

Summary

In summary, the construction testing program, the preopertional test record drawing review, the conduct and evaluation of the preoperational tests, and the drawing change programs together provide a high degree of confidence that drawing discrepancies with any safety significance will be discovered, evaluated, and appropriately corrected.

Construction, W12B21 C-K

DATE : March 1, 1983

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE MEETING

The Watts Bar Independent Review Policy Committee met on February 18, 1983. Members present were: J. W. Anderson, E. G. Beasley, C. Bonine, H. N. Culver, R. M. Pierce and M. N. Sprouse. Others present included: H. L. Jones, M. S. Martin, D. R. Patterson, J. A. Raulston and J. E. Wilkins.

The status and schedule of the B&V independent review were briefly noted. All level 1 responses were completed and returned to B&V on or before February 14, 1983. The return of the level 2 responses to B&V complete the OEDC interface with B&V until the B&V report is issued. We have received 178 level 3 comments from B&V. Our informal information indicates that B&V will complete their level 3 reviews by March 9 or 10 and will issue the report by the end of March.

It was noted that B&V had properly and adequately accomplished their specific contract requirements; that is, that they performed a review to allow them to reach a conclusion that the auxiliary feedwater system meets the license application requirements and notes any exceptions. In doing this it appears that B&V has not identified all possible ramifications from the findings.

H. L. Jones passed out a list of 10 observations and conclusions and discussed them in some detail. The findings involve a number of ECNs and NCRs; 18 ECNs have been written. Approximately 24 NCRs have been written—about half of which are significant and three reportable. The findings also identified concerns previously noted on eight significant NCRs—seven of which had been reportable. Approximately one—fourth of the findings were involved with the NCRs. The remainder of the findings is of minimal or of no concern.

Each finding that required corrective action has had that corrective action identified for it and the corrective action is being tracked in the appropriate log. B&V is developing a punchlist; the B&V punchlist items will need unique identification and closure. When the punchlist arrives, H. L. Jones will work with the responsible person to assure each punchlist item gets in an appropriate tracking system or is specifically identified as being closed.

OEDC MO Files March 1, 1983

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE MEETING

Due to the high visibility of the B&V report and Region II's recently identified concerns for promptness it appears appropriate for OEDC to identify and initiate any programmatic changes or adjustments prior to receipt of the B&V report. In addition, where there appears to be disagreement with the license application OEDC needs to take the appropriate steps to assure that the more important conditions are endemic to the auxiliary feedwater system. It was mutually agreed among the policy committee members that these actions should be undertaken immediately. It was agreed that EN DES would take the lead and OQA and CONST would assist.

The policy committee agreed to meet as soon as this organization has developed a course of action so that concurrence could be obtained.

<u>Post Meeting Note:</u> Task force under the leadership of Henry Jones and comprised to John McDonald, Bob Olson, Don Denton and Ed Cole began working on Tuesday, February 22.

SUBJECT:

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE MEETING

The Watts Bar Independent Review Policy Committee met on February 28, 1983. Members present were: J. W. Anderson, E. G. Beasley, C. Bonine, H. N. Culver, R. M. Pierce and M. N. Sprouse. Others present included: J. W. Coan, E. H. Cole, D. R. Denton, H. L. Jones, M. S. Martin, J. A. McDonald, D. R. Patterson, R. A. Pedde, and R. W. Olson.

The task force appointed as a result of the February 18, 1983, policy committee meeting consists of Henry Jones, team leader; Ed Cole; Don Denton; John McDonald; and Bob Olson. The team has been in daily sessions since February 22, 1983.

Attachment 1 is a list of task force responsibilities. Attachment 2 is a flow chart that will be used in the evaluation of the Black and Veatch findings. Attachment 3 is an instruction keyed to the flow chart. The policy committee generally agreed with the course of action outlined in these three attachments.

The first two pages of Attachment 4 group the B&V finding 34 categories according to the nature and subject of the finding. The task force consolidated these into 20 categories that need further evaluation. Categories 1(1) and 1(2) need no further evaluation. Category 1(3) requires further review to determine whether a deviation exists. The evaluation is to consider the cause of the problem and determine if it is applicable to Watts Bar on systems other than auxiliary feedwater and to Sequoyah, Browns Ferry, and Bellefonte.

The third page of Attachment 4 is a preliminary assessment of the 21 categories. The fourth, fifth and sixth page of Attachment 4 is the evaluation form. The evaluation form will be completed on each of the 20 categories requiring evaluation. One form will be used on each category for Watts Bar unit 1, Sequoyah, Browns Ferry, Watts Bar unit 2 and Bellefonte. The task force will consider the units and plants in that order. However, if a category is found to be applicable to Sequoyah or Browns Ferry and is identified as having an immediate safety implication, it will be given first priority.

OEDC MO Files March 4, 1983

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE MEETING

The task force estimated they will complete the determination of applicability of each category to unit or plant by March 14. (Post Meeting Note: The task force's experience on completing applicability on Watts Bar unit 1 indicates that comprehensive review will extend the established completion date to March 22, 1983.)

The course of action outlined above received the concurrence of the policy committee. Chuck Bonine and Mac Sprouse agreed that once the task force determines that a category is applicable to a specific unit or plant, Henry Jones, as task force chairman, should forward the evaluation form directly to the appropriate EN DES or CONST branch or project with instructions and directions for completion of the evaluation and corrective action.

The program plan defined and implementation initiated will have to be very prompt if we are to have our overall plan formulated by the time the B&V report is issued at the end of March.

Henry Jones noted the task force will need assistance on the Browns Ferry and Bellefonte forms.

ATTACHMENT 1

Establish a Task Force under the OEDC Policy Committee to perform the following functions:

- a. Recommend overall methodology for evaluating B&V findings
- b. Recommend assignment of organizations or individuals for performing each specific element of the evaluation process, considering itself, OEDC, other TVA and non-TVA organizations.
- c. Establish and maintain surveillance a... tracking over the implementation of the evaluation process.
- d. Designate and cause retention of appropriate records of the evaluation process.
- e. Factor the results of the response to B&V findings with other systemmatic efforts to prepare a basis for determining the overall adequacy and licensability of Watts Bar Nuclear Plant unit 1.
- f. Coordinate the utilization of B&V information generic to other TVA units.

ATTACHMENT 3

Instructions for Evaluating B&V Findings per Flow Chart

1. Evaluate all 428 B&V findings to determine whether a deviation existed with respect to either TVA's licensing or internal commitments for design, construction, or operation. (It is recognized that operations preparedness was not specifically reviewed; however, indicators of deviations with respect to these commitments must be evaluated.)

Designations used for findings when evaluation by Task Force determines that further review is not required will be:

- 1(1) TVA and B&V consider there to be no deviation.
- 1(2) B&V identified deviation from final design or construction requirements for which TVA has determined work to be incomplete. To be incomplete, the CONST accountability system and/or an OEDC deviation control system must have identified the remaining work prior to B&V identification.

Designation used when additional input is required:

1(3) - B&V findings which require further review to determine if deviation existed since OEDC disagrees with B&V conclusion. Upon completion of this review, all of these findings must be assigned to one of the categories.

- 2. Sort all remaining findings into generic and individual categories to streamline the evaluation process. B&V findings are generic at this point if the deviation is recurrent within the scope of the B&V review.
- Evaluate circumstances surrounding the deviation identified by each category to determine root cause(s) in management controls which allowed the deviation in the work activity. Also, evaluate root causes against those in other reviews (CAT, INPO, NSRS, etc.).
- 4. Based upon the root cause(s) identified in 3, select samples of work activities which were affected to review for generic deviations in work activities for WBN unit 1 outside the scope of the auxiliary feedwater system and determine potential effects on work activities for WBN unit 2, SQN, BFN, and BLN.
- 5. Evaluate the B&V identified findings and the generic examples identified in 4 to determine whether the identified finding(s) or root cause prevent the satisfaction of the licensing basis.
- 6A & 6B. Identification and evaluation of ongoing corrective action to correct identified findings and root causes for completed action.
- 7A & 7B. Identification of corrective action to correct identified findings and root causes for completed work.

8A & 8B. Self-explanatory.

9A & 9B. Identification and evaluation of ongoing corrective action
to correct identified findings and root causes for future
work.

10A & 10b. Identification of corrective action to correct identified findings and root causes for future work.

11A & 11B,

12A & 12B. Self-explanatory.

E63059.06

	ATTACHMENT 4
SOTES:	
1. Findi	nge which do not require evaluation for determination of corrective action.
	Findings for which B&V and TVA consider there to be no deviation. Information subsequently given by TVA resolved B&V finding (R) and represented a TVA position that no deviation existed with respect to licensing or internal counitments.
	Examples
	F134 - Lack of test data for Tlame test of cable. TVA subsequently provided BLV with existing cable flame test results.
	F302 - TPIPE computer program not described in FSAR. TVA subsequently provided B&V with existing licensing submittel letter to MRC.
1(2)	BSV identified deviation from linel design or construction requirements for which TVA has determined work to be incomplete. To be incomplete, the CONST accountability system and/or an OEDC deviation control system must have identified the remaining work prior to B&V
	Exemples
	F357 - Restraint modeled for rigid restraint in vertical direction while designed support restrains in axial/lateral directions. TVA response - Ongoing corrective action for this deviation was incomplete under ECN 3198 and ECN 2576.
	F700 - Hanger not installed. TVA response - Incomplete construction status was correctly reflected under accountability proram WBN QCI-
i(3)	ESV findings which require further review to determine whether a deviation existed. OEDC disagrees with B&V identification of a deviation. Upon completion of review, all these findings must be assigned to another appropriate category.
	Examples:
THE STREET SHARE WILLIAM STREET	F108 - Red indicating light for valve thermal overload bypass does not verify operation of relays R1 through R6. OEDC position - circuit design was reviewed by MRC and approved in SER.
	F137 - Trip setting for electrical breaker not in accordance with manufacturer's recommendation. OEDC position - settings are in accordance with manufacturer's recommendations.
2. This ca	tegory has been eliminated and all findings placed in other categories.
3. Logic/co	ontrol drawings do not agree with electrical drawings - NCR WBNSWP8267.
-> 4. Failure	to design/maintain design records as specifically described in FSAR-GEN(288213, GENNEB8301, GENCEB8215, WBNCEB8206.
5. Procurer	sent data sheets and action diagrams for PCVs, LCVs, and check valves specified less than design requirements - ECN 3511, WBNNEB8207.
5 6. Deviation	one in translating support computer analysis results to load tables and then to support deigns - WBNCEB8232, WBNCEB8233, WBNSWP8272,
7. Nonconfo 4535R (R	orming conditions of construction of previously inspected and accepted pipe supports - NCR 4454R (R1), NCR 4455R (R0), NCR 4486R (R0), NCR 4486R (R0), NCR 4481R (R0), NCR 4476R (R0), NCR 4486R (R0), NCR 4481R (R0), NCR 4476R (R0), NCR 4486R (R0), NCR 4481R (R0), NCR 4476R (R0), NCR 4486R (R0), NCR 4481R (R0), NCR 4481R (R0), NCR 4476R (R0), NCR 4486R (R0), NCR 4481R (R0), NCR 448
	m has been reassigned to Note 4.
2 9. Excessiv	e loads/eccentric load on embedments - MCR WBNCEB8203.

E. Gray Beasley, Assistant to the Manager of Engineering Design and

Construction, W12B21 C-K

DATE

[:] May 2, 1983

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING

NOTES

The Watts Bar Independent Review Policy Committee met on April 28, 1983. Members present were: J. W. Anderson, E. G. Beasley, C. Bonine, H. N. Culver, R. M. Pierce, and M. N. Sprouse. Other present included: R. W. Cantrell, H. L. Jones, R. A. Pedde, D. R. Patterson, J. A. Raulston, Ralph Shell and Tom Knight.

It was noted that the B&V report was received and distributed on April 20, 1983 by memorandum from G. H. Kimmons to Those listed (EDC 830420 401). The B&V executive summary and conclusions were discussed along with each of the 10 confirmed findings. The other items such as the open findings, the findings punchlist, and the documented review punchlist were discussed in general. It was agreed that each item would be separately addressed.

The status of the task force review was discussed. No changes in direction for the task force were made as a result of the receipt of the report.

Ralph Shell gave a brief history of past NRC handling of independent review reports. He noted that NRC will work directly with B&V and that we should anticipate NRC issuing a safety evaluation report (SER) on the independent review and that we should be prepared to respond should they issue the SER. It was agreed that Henry Jones and Ralph Shell would contact the B&V project manager and inform him that he should expect to be contacted direct from NRC.

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING -

MEETING NOTES

Reference: H. L. Jones' memorandum to Those listed dated July 18, 1983 (NEB 830718 271)

The policy committee met July 28, 1983. The members present were: E. G. Beasley, H. N. Culver and R. M. Pierce. Others present included: R. W. Cantrell, H. L. Jones, D. R. Patterson, J. A. Raulston, J. E. Wilkins and J. R. Lyons. A copy of the agenda is attached.

It was announced that each of the 25 task force categories had been entered in TROI for Browns Ferry, Sequoyah, Watts Bar unit 1, Watts Bar unit 2 and Bellefonte Nuclear Plants and that actions had been entered in accordance with assignment and schedule set by the task force.

Table 1 of the reference is a summary of the 25 categories for Watts Bar unit 1. Table 1 shows 9 where the licensing basis is not satisfied and corrective action is not in place. Of these 9, one--category 23--has been evaluated and confirmed that the licensing basis has been met. On 4 of the 9--categories 4, 14, 20, and 35--the evaluation has confirmed the licensing basis has not been met. Corrective action is proceeding such that the licensing basis will be met consistent with unit 1 fuel loading.

On 4 of the 9--categories 3, 6, 30 and 37--the evaluation is continuing. Category 3 concerns a mismatch between logic and control diagrams and detailed electrical drawings. The evaluation of category 3 is of particular concern due to basic nature of the problem and the informal estimate that 90 man-months will be required to review and evaluate the Watts Bar 1 drawings.

Those present agreed that the licensing basis on all 25 categories must be satisified for Watts Bar unit 1 before the OEDC Manager certifies to the General Manager and Office of Power that unit 1 is ready for fuel loading and before we can ask NRC to write off on the B&V independent review. Evaluations must proceed on the schedule that has been set by the task force to not impact the Watts Bar unit 1 schedule.

It was further agreed that for category 3 on Watts Bar unit 1 we must proceed posthaste to evaluate the seriousness and importance of the mismatches between the drawings. It was agreed the Watts Bar design project should be instructed to evaluate the mismatches identified by B&V on the auxiliary feedwater system. Further, the Watts Bar design project should select three other process systems and proceed to identify the mismatches

OEDC Manager's Office Files August 2, 1983

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING - MEETING NOTES

that may exist in those systems and to evaluate the seriousness and importance of each mismatch and of the aggregate. Of the three process systems, two should have the pre-op tests complete. If available, the evaluation for those two systems should list the mismatches identified by NUC PR in the pre-op and their other NUC PR involvements with the system. This evaluation is needed as soon as it can be done and should be completed no later than October 1, 1983.

Those present further agreed that the task force categories for all plants while not designated as nonconformances must be treated similar to non-conformances and violations with respect to the evaluation and where applicable the cause and action to prevent reoccurrence. The categories should be treated with the same seriousness and priority as 50.55e items and NCR violations as the independent review is a commitment to the NRC.

With respect to the "general observations" section of the reference, all five items were noted. It was agreed that items 1 and 2 would be referred to EN DES for their consideration along with the EN DES effort now underway on design control. The task force was requested to expand and clarify item 4 on efforts to identify generic applications and then bring the item back to the policy committee.

The reference included a list of "concerns outside the scope of the task force responsibility." All six items were noted by those present, and item 4 concerning verification of alternately analyzed pipe under 2-1/2" diameter was referred to EN DES to develop a position.

Items A and B of the attachment to the agenda were noted and it was agreed that the chairman of the policy committee would clarify the instructions to the task force relative to the task force role and responsibilities.

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING - MEETING NOTES

- *(1) Please consider items 1 and 2 of the general observations in the reference in your work on design control process.
- (2) Please develop an OEDC position regarding additional verification of alternating analyzed pipe less than 2-1/2" in diameter (for item 4 of the concerns outside the scope of the task force responsibility in the reference).
- (3) Instruct the Watts Bar Design Project to expand the sample for category 3 and report the results back through the task force.
- **Please expand and clarify item 4 of the general observations in the reference.

AGENDA

BLACK & VEATCH POLICY COMMITTEE

12:30 p.m. - July 27, 1983 - W12A3 C-K

I	Task Force Categories on TROI	Beasley

Other items

VI

OBSERVATIONS

A. GENERAL STRUCTURE

Responsibility for the resolution of the issues raised by Black and Veatch does not clearly rest with cognizant organizations, the Task Force, or the Policy Committee. Authority to control the resolution does not clearly rest with the cognizant organizations, the Policy Committee, or individual committee members.

B. COGNIZANT ORGANIZATION EFFORTS

Inability of the cognizant organizations to direct adequate manpower resources from production-related activities to problem evaluation.

Evaluators do not adequately understand management controls in order to determine cause(s) so that generic examples and actions to prevent recurrence can be effectively identified.

Unwillingness to identify actions which would require additional resources in order to avoid an adverse impact on schedule.

Unwillingness to accept that current activities may be resulting in similar deviations.

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING -

MEETING NOTES

Reference: My memorandum to Those listed dated August 5, 1983

(EDC 830805 401)

The policy committee met August 15, 1983. The members present were:

J. W. Anderson, E. G. Beasley, C. Bonine, H. N. Culver, R. M. Pierce and

M. N. Sprouse. Others present included: R. O. Barnett, R. W. Cantrell, F. W. Chandler, E. H. Cole, D. R. Denton, H. L. Jones, J. A. McDonald,

R. C. McKay, M. S. Martin, D. R. Patterson, R. A. Pedde, J. C. Standifer and D. W. Wilson.

Each category listed in the attachment to the reference was individually reviewed. There was agreement among those present that the licensing basis must be met prior to Watts Bar unit 1 fuel loading. The course of action and schedule outlined were considered to be adequate, with the exception that for category 30 some additional sampling may be necessary.

A copy of a proposed memorandum from E. G. Beasley to H. L. Jones outlining task force responsibilities was given to policy committee members. It was mutually agreed that the memorandum should be sent.

Category 3 which was the subject of the August 2, 1983, policy committee meeting was discussed. The Watts Bar project progress appears to be adequate.

DATE : October 6, 1983

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE

MEETING - MEETING NOTES

References: 1. J. A. Raulston's memorandum to NEB Files dated September 29, 1983 (NEB 830929 265).

2. C. Bonine's memorandum to E. Gray Beasley dated August 16, 1983 (DOC 830816 001).

3. J. C. Standifer's memorandum to H. L. Jones dated September 29, 1983 (WBP 830929 024).

The policy committee met September 30, 1983. The members present were: J. W. Anderson, E. G. Beasley, C. Bonine, H. N. Culver. R. M. Pierce was represented by J. W. Coan; M. N. Sprouse was represented by R. W. Cantrell. Others present included: H. L. Jones, J. A. McDonald, D. R. Patterson and J. C. Standifer.

The recent meeting with NRC was discussed in detail (see reference 1 for background information). The proposed approach for resolution of the findings is to move all B&V findings into either resolved or confirmed status and then for those findings in the confirmed status to obtain B&V concurrence on corrective action. A proposed letter to Black & Veatch was presented, and it was generally agreed to send the letter. (NEB 831604 251)

Consistent with the last action item in reference 1, OEDC will work toward addressing the generic applicability of the B&V findings to other Watts Bar systems and to other TVA nuclear units. Work will proceed as in the past using the task force information to develop a succinct report addressing generic applicability to Watts Bar units 1 and 2. For those items the task force determines to be generic, the root causes implications and appropriate corrective action will be defined.

Both the specific resolution of the independent B&V findings and the generic applicability to Watts Bar 1 and 2 should be completed by mid-December such that the report can be made to NRC in early January.

The task force will continue to address the generic applicability to plants other than Watts Bar. This work should proceed at a pace such that we can respond to questions should they arise during the NRC presentation on Watts Bar.

OEDC Manager's Office Files October 6, 1983

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING - MEETING NOTES

Reference 2 requested discussions on earlier task force recommendations. The three specific concerns in reference 2 were discussed in general. One concern in reference 2 dealt with the expansion of the 79-14 hanger inspection program alternately analyzed to pipe 2 inches and under. That task force recommendation had been referred to EN DES during the original discussion by the policy committee. The EN DES report is included as Attachment 1. The report agreed with the NRC portion to exclude small-diameter pipe from the 79-14 inspections. The general task force discussion agreed with this position.

In the July 18, 1983, policy committee meeting during discussion of task force category 3 the Watts Bar design project was requested to identify the mismatches between conceptual and detail drawings on three Watts Bar unit 1 systems. Reference 3 was the report on this study. Based on the study, J. C. Standifer recommended that no further action be taken due to the unimportance of the mismatches. Reference 3 and J. C. Standifer's recommendation were referred to the task force for a more detailed evaluation.

Engineering Design Position on the Exclusion of Small Diameter Alternate Analysis Piping from NRC OIE 79-14 Programs

This documents our past and future position related to the exclusion of alternately analyzed piping 2-1/2 inches and less in diameter from the NRC OIE Bulletin 79-14 programs at TVA. Bulletin 79-14 specifically excludes small diameter piping not qualified dynamically by computer and, after review by EN DES, we concurred with the NRC position. It should be noted that a significant amount of small diameter piping has been rigorously analyzed and, as such, was included in the 79-14 program. The remainder of the small diameter piping is qualified by a very conservative alternate analysis criteria.

Alternately analyzed piping is determined to be adequately supported for several reasons. Since the criteria was developed to support piping very conservatively in the rigid range of response, a greater degree of tolerance is permissible on pipe routing and support requirements. This conservatism has been repeatedly shown by rigorous analysis of previously alternately analyzed piping and, in most cases, 50 percent or more of the supports can be removed. Also, it is normally the case that small diameter alternately analyzed piping is less critical relative to safety concerns since high energy piping and class I piping greater than I inch in diameter requires rigorous analysis. Also, less energy is involved with the low mass small diameter piping and therefore less potential for damage exists. This type of piping is often field supported and is documented on a field generated isometric. In this case, the isometric is "as constructed" so that no discrepancies should exist between the piping and its corresponding isometric.

A vast majority of current 79-14 discrepancies are interferences. These are less significant for small diameter piping where less energy is available to create problems. Also, since the piping is supported rigidly, interferences tend to dampen seismic response and limit the energy level even further. Although troublesome, interference problems with small diameter piping do not usually create safety problems and are of limited importance due to the small displacements associated with a rigid support configuration. Another discrepancy has to do with support of concentrated weights such as valves. For alternately supported piping where the configuration is rigidly supported and extra supports at concentrated weights are often required by criteria (or at least specifically addressed by requiring reduced spans), inadequately supported concentrated weights are seldom a problem.

Therefore, our policy has been and is to exclude small diameter alternately analyzed piping from the NRC OIE Bulletin 79-14 programs at TVA.

In the future, less small diameter piping will be alternately analyzed due to the use of approaches such as the Computer Aided Piping Analysis and Support Design (CASD) system now being implemented. These rigorous analysis systems are being implemented to reduce the conservatism inherent in alternate criteria and for the resulting economic benefits. CASD analyzed piping will fall under the 79-14 program. However, our position is that our current 79-14 program goes beyond the requirements of the NRC Bulletin. In order to consider the large amount of small diameter piping, the TVA 79-14 "phase I" program would be limited to a visual inspection of piping configuration and support requirements. This type of program must be coupled with an augmented QA inspection program including the establishment of an interference control program to control this major source of discrepancies in order to reduce the results of the 79-14 program to a more manageable level. Assurance that the design basis and NRC requirements have been met will be obtained by an audit program similar to our current detailed 79-14 "phase II" walkdown of a limited sample of analyses.

E. Gray Beasley, Assistant to the Manager of Engineering Design and

Construction, W12B21 C-K DATE

December 7, 1983

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING - MEETING NOTES

> The Black and Veatch policy committee met on December 6, 1983. The members present were: J. W. Anderson, E. G. Beasley, C. Bonine, H. N. Culver, R. M. Pierce and M. N. Sprouse. Others present included: H. L. Jones, H. E. McConnell, D. R. Patterson and J. C. Standifer.

H. E. McConnell reported on the status of the corrective action on individual findings. All corrective action reports have been completed and the last seven are being transmitted to Black & Veatch by Federal Express. Most of the forms were transmitted to Black & Veatch by the November 22, 1983, deadline. Informal contacts between McConnell and Black & Veatch indicated that 45 of the corrective action reports have been approved and our coversheet is being returned to TVA. Twelve other finding corrective actions have been identified as having minor problems. McConnell is working direct with Zidziunas to resolve these minor items.

In the ensuing discussion, it was agreed that we should stick to our schedule and clean up the finding corrective action reports by January 2 and be prepared to meet with NRC by mid-January. McConnell will informally remind Black & Veatch of this schedule.

Henry Jones reported on the status of the task force activities. The status of each of the 25 task force categories for each of the plants is summarized in Attachment 1. It was mutually agreed that the task force efforts and the project and branch support on open categories should proceed posthaste toward resolutions so that we can adhere to our mid-December date for resolution of task force categories on Watts Bar units l and 2.

During October, memoranda were sent to NUC PR requesting allocation of funds to address the task force categories for Sequoyah and Watts Bar.

The task force had difficulty resolving four categories (one category on Bellefonte, one category on Sequoyah, and two on Watts Bar). The Bellefonte category concerned discrepancies between various levels of electrical drawings; this category has been resolved based on the

OEDC Manager's Office Files December 7, 1983

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING - MEETING NOTES

corrective action on an earlier nonconformance report. The Sequoyah category dealt with the closing of a large ECN. The problem has been discussed with PWP and now appears that some additional work by PWP will resolve the issue.

It appears that one of the two Watts Bar categories has been resolved. The resolved category concerns surveillance testing capability of the motor-operated valve thermal overload bypasses. A position has been discussed with ESB and appears to be a logical resolution. The resolution is to work a DCR after fuel loading which will make the testability of the system fully meet regulatory requirements. In the interim until the DCR has been worked, the bypasses can be tested by two persons—one acutating a switch and the other observing relay mechanical motion.

The other problem category on Watts Bar concerns discrepancies between logic schematic wiring and connection diagrams. This was discussed in two earlier policy committee meetings. The task force is still looking at their position on these discrepancies. In addition I am not comfortable in that I feel that these types of discrepancies are highly undesirable and are not the type of work which TVA should be doing relative to nuclear work.

Four reports are planned to complete the independent review program. The first report will be the supplemental report prepared by Black and Veatch. This supplemental report will be transmitted direct to NRC. Black and Veatch has indicated the major element in this report will be the corrective action forms TVA has submitted to Black and Veatch on each finding that was confirmed, open or punchlisted. Black and Veatch has also stated that there will be a minimum of explanation of their review of the corrective action.

Depending upon the nature of the B&V supplemental report, TVA may need to develop a report responding to the specifics raised by B&V. If so, a separate report addressing these specifics will be prepared.

The task force is planning a comprehensive report on their work concerning the generic applicability of the findings to other than the Watts Bar unit lauxiliary feedwater system. The task force report will include information on the grouping of the findings, the breakdown of the categories, and will specifically address whether or not the licensing commitments have been met as well as the usual attributes of conditions adverse to quality, such as applicability to past work and corrective action to prevent recurrence.

OEDC Manager's Office Files December 7, 1983

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW - POLICY COMMITTEE MEETING - MEETING NOTES

The fourth report will consist of the overview and actions of the policy committee. This report will in essence tie together all of the work and be one component of a certification package used for the overall certification that Watts Bar has been built in accordance with the licensing application. It is envisioned that the latter three reports will probably be letter reports from various persons with the policy committee report being a letter report to Mr. Kimmons.

DATE

September 24, 1984

SUBJECT: WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

Reference: Memorandum from G. H. Kimmons to Those listed dated October 7,

1982 (EDC 821007 005)

The Watts Bar Independent Review Policy Committee met on September 19, 1984. Members present were: C. Bonine, Jr., H. N. Culver, R. M. Pierce, R. W. Cantrell, and myself. Others present were H. L. Jones,

D. R. Patterson, and J. A. Raulston.

The task force evaluation for each category was a 12-step process. Step 12 was to determine the effectiveness of the corrective action for future work. In August 1983 the task force was directed to not complete step 12 due to lack of task force resources. Instead, the forms completed through step 11 were to be forwarded to OQA and OQA was to complete step 12 as part of their surveillance and audit program. In OQA the responsibility was assigned to the Quality Improvement Staff and subsequently reassigned to the Design Quality Assurance Branch. The reorganization resulted in the Design Quality Assurance Branch being transferred back into the Office of Engineering (OE). The OE Quality Management Staff has assumed the responsibility for closure of step 12. After step 11 is complete, the task force will forward the forms to QMS. QMS will complete step 12 and return the forms to the task force for closure.

During August 1984 Region II examined the management and quality controls related to the Black and Veatch independent review. The inspection report included one follow-up item (390/84-57-01). The follow-up item required TVA to formalize and develop a comprehensive plan for completion of items associated with the Black and Veatch study--that is, the closure of the task force evaluation forms. The follow-up item included evaluation for applicability of the categories to similar findings at other TVA nuclear plants. The plan for closure has been developed with closure to be complete on all Watts Bar categories by the end of November 1984. Region II has been so informed so they may complete their follow-up. With respect to applicability to other nuclear plants, the task force categories have been applied and work is progressing in that area. The actions taken and scheduled to be taken through November 1984 should enable complete closure of the Black and Veatch report on Watts Bar and closure of the Region II inspection follow-up item.

Office of Engineering Files September 24, 1984

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

Task force category 30 for Bellefonte involves work that is not yet undertaken. In the past the task force was directed to close out findings and categories when the corrective action was in an ongoing tracking system. The commitment for Bellefonte task force category 30 is in the FSAR and is included in the regulatory guide commitment sheets. It is not in PC-III nor is it in the commitment tracking record maintained by NEB. The policy committee directed that a commitment tracking record be established to track Bellefonte task force category 30 to closure.

Black and Veatch finding 137 dealt with Electrical Design Standard E9.2.1 in that some designs had been accomplished prior to issuance of the design standard. The corrective action given to Black and Veatch and used in their acceptance of the corrective action for closure was that all systems would be brought into the requirements of Electrical Design Standard E9.2.1.

Subsequent to the approval by Black and Veatch, Electrical Design Standard E9.2.1 has been superseded by a design guide which relaxes the requirements in that the engineer has the option on whether or not to follow the guide. The corrective action to bring Watts Bar up to E9.2.1 has been completed. Primary concern was that we had changed the commitment that had been the basis for Black and Veatch concurrence on the corrective action. The policy committee agreed that the Black and Veatch Program Manager should call Black and Veatch, explain the situation, obtain Black and Veatch concurrence, then have Black and Veatch distribute their telephone note signifying agreement the same as they had distributed the initial report.

It was noted that Region II had made an inspection on civil and mechanical aspects of Black and Veatch. While several concerns were raised in the exit meeting, none specific to Black and Veatch as their concerns had been identified prior to the Black and Veatch review.

I had been informally notified that Leonard Blankner, a member of the task force, is transferring from OQA to Watts Bar site. It was agreed by the policy committee that the remaining members of the task force—namely Henry Jones, Don Denton, and Ed Cole—should complete the task force work without replacing Leonard.

Office of Engineering Files September 24, 1984

WATTS BAR NUCLEAR PLANT - INDEPENDENT REVIEW POLICY COMMITTEE

In summary, all Black and Veatch findings, concerns, and task force concerns are scheduled and now on a routine closure. It was mutually agreed that further meetings of the policy committee would not be appropriate. If there are task force concerns or independent review concerns, they should be directed to the appropriate P&E Office Manager.

At the suggestion of R. M. Pierce, it was unanimously agreed that the task force has performed admirably under unusual and trying circumstances and for a sustained perid. The task force consolidated the numerous findings into definite categories and provided leadership and direction for each to be methodically and logically evaluated and assessed for other systems on Watts Bar and the other nuclear plants. The entire issue has been thoroughly evaluated and the TVA processes significantly improved through the diligent efforts of the task force.

NUCLEAR SAFETY REVIEW STAFF (NSRS) ASSESSMENT OF THE RESULTS OF THE BLACK AND VEATCH (BGV) INDECEMBENT DESIGN REVIEW OF THE WATTS BAR NUCLEAR PLINT (WBN) AUXILIARY FEEDWATER SYSTEM - NSRS REPORT NO. R-84-19-VBN

During various phases of the B&V review, the RSRS independently examined various activities so that it would be in a position to draw conclusions regarding both the adequacy of the work performed by B&V and the TVA line response to the findings and their subsequent actions.

From January through March 1984, NSRS had made sufficient evaluations to support the basic conclusions set forth in the Policy Committee report dated March 20, 1984. As a part of the detailed evaluation made by NSRS, a number of findings were identified that NSRS has examined in greater detail. These represent areas where NSRS considers further corrective action is required.

The attached report provides seven recommendations for follow-up action. Two of the recommendations relate to problems with the drawings at the plant. Recognizing the problems that you are presently finding in this area at BFN, we believe you will want to take corrective action at WBN to establish configuration control as soon as possible. It is our understanding that you are committed to expanding the BFN RPIP program to all of the TVA nuclear plants. We believe that if the same program actions you are taking at BFN are taken at WBN, the problems identified at WBN can be adequately addressed.

Within 30 days of receipt of this memorandum, please provide NSRS your plan of action to respond to the recommendations. Any questions concerning the report should be addressed to J. F. Murdock of my staff at extension 6620-K.

I. PURPOSE AND SCOPE

The NSRS performed an assessment of the results of the Black and Veatch (B&V) Independent Design Review of the Watts Bar Nuclear Plant Auxiliary Feedwater System to determine if we could support the policy committee report regarding the B&V review and to document areas where NSRS considered additional action was needed. The adequacy of the immediate corrective actions and the degree of "lessons learned" to other Watts Bar plant features and to the TVA nuclear program in general were assessed.

.

The Black and Veatch initial and supplemental reports, the activities of the TVA program team and cognizant line organizations, the activities of the TVA management policy committee and its report, the activities of the policy committee task force and its report, discussions with the TVA line engineers and managers, and onsite verification form the scope and basis of the NSRS assessment. Since the full applicability of the Black and Veatch findings to all the TVA nuclear facilities has not been determined by TVA, NSRS will perform followup assessments where appropriate.

II. EXECUTIVE SUMMARY

From January through June 1984, the NSRS performed a review and analysis of the results of the Black and Veatch (B&V) Independent Design Review of the Watts Bar Nuclear Plant (WBN) Unit 1 Auxiliary Feedwater (AFW) System and the TVA activities in response to the B&V findings. The NSRS review covered the B&V initial and supplemental reports, the activities of the TVA program team and the cognizant line organizations, the activities of the TVA management policy committee, and the activities of the task force of the policy committee.

The impetus of the NSRS effort was to assess:

- the quinty and appropriateness of the B&V review and the selection of the AFW system as the representative system;
- the technical adequacy and consistency of the TVA responses to the individual B&V findings;
- the determination of causes and generic applicability of findings and categories of findings to other WBN unit 1 systems and to other TVA plants; and
- the analyses and evaluations performed to determine the safety implications of the findings or categories of findings had the B&V activity not taken place.

The following conclusions were reached from the NSRS assessments;

- 1. The AFW system was a good choice for a multidiscipline representative review. The B&V review was generally complete in depth and technically competent. A weakness in the B&V review was the lack of detailed examination of the consequences of findings by onsite verification. Since the B&V review was based upon the FSAR of record in 1982 and further design changes or FSAR amendments have been and will be implemented, the degree of conformance with current regulatory positions could not be determined. This could lead to continuing direction from NRC as the plant begins operation, particularly from the I&E Office.
- 2. For the greater part, NSRS agrees with the resolution of specific findings. The notable exceptions are in the electrical discipline (cable tray fill and treatment of protective devices) and in the structural discipline (embediments and attendent attachments) Followup discussion with EN DES, both in Knoxville and at the site, have led to resolution of the NSRS concerns in the structural area assuming the current (post-B&V study) EN DES practices are formalized in the proper procedures. In addition to the specific technical disagreements, NSRS found the definition of the safety impacts of the findings to be inconsistent with the basic engineering and safety reasons for having the features in place. A second weakness was that the record of resolution of the findings was not uniformly and completely documented.
- 3. NSRS substantially agrees with the task force grouping of findings into categories by way of determination of causes and the determination of generic applicability. In some cases more than one root cause could have been assigned a finding. Thus, the judgement of the reviewer as to the more important factors could be questioned; however, these differences are considered of low consequence.
- The identification and correction of deviations or questionable conditions is a very important result of an effort such as the B&V review. Since a perfect plant or system is not likely to be found, the determination of the effect on the plant performance had the deficiencies not been discovered is deemed the most value able aspect of the B&V review program implemented by TVA. The NSRS assessments support the conclusions of the policy committee that there is no direct indication that any affected structure, system, or component would not have performed its safety function. The safety evaluations performed by EN DES also support the conclusion that the safety functions would be performed. However, it is the assessment of NSRS that some of the identified deficiencies could lead to indeterminant conditions or conditions adverse to quality and to safety which reduce the margin of safety. Further actions were and are required to assure the margin of safety committed in the FSAR are met.

Additional observations drawn from the results of the B&W review are:

- Considering the degree of completion of Watts Bar unit 1, the number of deviations found by B&V which would probably not have been discovered otherwise was fairly high. This underscores the value of independent design reviews by parties outside the TVA system. The findings would have been much easier to correct or avoid had the review been conducted earlier in the design/construction process. For lessons learned value, the Bellefonte project should consider this assurance tool.
- The nature of the deviations indicates a need to substantially upgrade the configuration management processes and personnel training programs in TVA.

III. RECOMMENDATIONS

A. R-84-19-WBN-1 (Category 3)

All controlled documents should be clearly identified for all plants. The purposes and uses for each of the documents should be delineated. Information contained in documents designated to be controlled should be assessed for contribution to the intended purpose and use. Superfluous information should be deleted and discrepancies in documents with overlapping information should be corrected. Establishing a verified "as built," rigorously documented, should be assigned a very high priority.

B. R-84-19-WBN-2 (Category 9)

Procedure EN DES EP4.03 should be revised as has been verbally committed to reflect that visual examinations supported by field calculations are the basis for documenting acceptability of changes to or additional attachments to embedded plates in the field.

C. R-84-19-WBN-3 (Cagegory 9)

Consideration should be given to additional sampling for multiple attachments to imbedded plates made prior to February 1983 or an evaluation of the consequences of failure of 1 to 15 percent of the supports in view of the overstressed anchor in one of the 69 plates already sampled.

D. R-84-19-WBN-4 (Category 20)

The methods and procedures for determining the proper values, physically setting, and verifying time delay relays settings should be reevaluated and indicated changes should be expeditiously made TVA-wide.

E. R-84-19-WBN-5 (Category 34)

See recommendation for Category 3.

F. R-84-19-WBN-6 (Category 35)

The instantaneous trip breakers should be verified to be set in agreement with the intent of the National Electric Code. The documentation for the design as well as for the testing and operations of the equipment should reflect the proper values. The program should be implemented TVA wide.

G. R-84-19-WBN-7 (Category 36)

Criteria should be developed for field use to control actual cable tray fill levels and to provide a basis for QC inspection. A feedback system should be included from the construction forces pulling cable to the designers routing cable to avoid the overfill problems to date. Although the problems at WBN 1 may be beyond fixing in many instances, expeditious action should be taken to upgrade the system for WBN 2 and Bellefonte.

IV. DETAILS

A. Background

From September 1982 through February 1984, an independent review of the Watts Bar Nuclear Plant (WBN) auxiliary feedwater system was performed by Black and Veatch (B&V) to determine the conformance of the system to commitments docketed in the FSAR. A TVA program team provided responses and additional information to the B&V reviewers to resolve questions and define corrective actions for confirmed deviations.

In a separate activity, a policy committee and a task force, both composed of senior TVA staff, evaluated the B&V findings for significance to other WBN unit 1 and 2 systems. The findings were evaluated for root cause and sorted into groups of similar nature. Where deemed appropriate, safety evaluations were performed to determine the consequences to the plant had the B&V review not been performed and the deviations gone undetected.

The B&V review findings were published initially in April 1983 and supplemented in February 1984. The results of the TVA task force efforts are documented in their March 1984 report to the policy committee chairman. The policy committee efforts are documented in their summary report to the EN DES Nuclear Engineering Branch.

The NSRS was involved throughout the process by being represented on the policy committee, by participating in the continuing reviews of the B&V findings and the TVA responses and by performing evaluations of the task force activities and report. The task force grouped the B&V findings into categories by determin-

ing the causes and generic applicability. The NSRS has evaluated each of these categories and basically agrees with the groupings of the findings. In the following section the NSRS evaluation of the categories is discussed. Any recommended follow-up action resulting from these evaluations is set forth in section III.

B. Discussion

General Observations

From an overall perspective, the B&V review showed that TVA did an acceptable design job in meeting the first order design requirements. Although there were a number of instances where the licensing commitments and licensing bases were not satisfied, further evaluations showed no cases where the ability to safely shutdown the plant was defeated. The deficiencies for the most part were failures to provide the additional margins of assurance committed in the FSAR. The basic causes for deficiencies involved lack of or poor training, failure to follow procedures, poor understanding of the commitments and lack of clear procedural definitions of commitments. In some instances the commitments were not rigorously met because they were viewed as enhancements as opposed to firm requirements.

Safety evaluations were performed by EN DES of the categories of findings where the licensing bases were not met. In all cases it was found that the ability to shutdown the plant had been maintained. The impacts of the reduced margin on overall plant safety and the effects of failure to implement the criteria for protective devices for plant equipment were not assessed.

2. Task Force Category 3

Category 3 contained 25 B&V findings where logic/control drawings did not agree with the electrical drawings. The identified cause for the category was failure to implement design review procedures as required by engineering procedure EP 4.25. The task force concluded the problems were generic to logic, control, schematic and connection diagrams throughout WBN units 1 and 2. The review was extended to three additional systems where similar problems were found. It was determined that corrective action was required for both past and future work.

The line organization has issued ECNs and FCRs to correct identified errors in hardware wiring and training was conducted in the I&C section of Sequoyah/Watts Bar Project (SWP) for EP 4.25. The drawings will be stamped to restrict the use to the intended function. No further reviews of other systems is planned to determine if other systems have

the same problems, in spite of the widespread problems identified in the four systems that were reviewed. These problems included instances where as many as 13 wires shown on one drawing were installed on the wrong terminals (FCR E-3508, system EA). Finding F805 identified a crosstic between normal and emergency 125 V dc systems. Schematic 45W603-46-6R4 was different in many significant respects from logic diagram 47W611-3-4R2.

NSRS agrees with the TVA line actions to the point of correcting known wiring errors. We do not agree that their corrective action for past and future work is adequate. Since the problems have been demonstrated to be common in the four systems reviewed, it is reasonable to assume the deficiencies are institutional and all the plant systems should be reviewed and deficiencies corrected. Further to knowingly allow discrepancies to continue to exist in overlapping documents and depend upon a note to control document usage is very poor practice. Although the precise reason for the wiring errors cannot be ascertained, having conflicting information on overlapping documents cannot be helpful in precluding such errors. Further, during operations, personnel such as ROs, SROs, maintenance engineers and crafts rely upon such drawings as logic diagrams and schematics to perform their jobs. Allowing discrepant information on any controlled document places too great a burden on the administrative control systems to preclude use for a wrong purpose and further errors attendent to this practice can be expected including further wiring errors and misoperating equipment. The correct way of handling drawing errors is specified in EP 1.26 "Nonconformances Reporting and Handling by EN DES." It may be necessary to have more training in procedures at the management levels since these actions are being prescribed by management. NSRS recommends that all controlled documents should be clearly identified for all plants. The purposes and uses for each of the documents should be delineated. Information contained in the documents designated to be controlled should be assessed for contribution to the intended purpose and use. Superfluous information should be deleted and discrepancies in documents with overlapping information should be corrected. Establishing a verified "as built," rigorously documented, should be assigned a very high priority.

3. Category 4

Category 4 contained 12 B&V findings which the task force described as failure to design/maintain design records for the AFW system as specifically described in the FSAR. The task force identified cause was that TVA personnel were not aware of the FSAR statements. When the design changed, the FSAR was not uniformly amended to reflect the new designs. The problem was deemed generic to both WBN units and required corrective action for past and future work.

A special engineering procedure (SEP 83-05) was written to verify the accuracy of the WBN FSAR. Additionally, EP 2.01 was revised (revision 5) to upgrade the procedure for processing FSAR changes and EP 4.02 has been revised to require that engineering change notices (ECNs) describe FSAR changes needed as a result of the design change. NSRS reviewed the SEP to assess its completeness. Little guidance is offered to the reviewers of the FSAR as to the depth or method of review. Further the B&V review found deficiencies in the TVA response to IE Circular 81-13 and IE Bulletin 80-20. The SEP 83-05 review was restricted to FSAR sections; questions, responses to IE bulletins, NRC generic letters, etc., were not included in the review. The SEP review may not have corrected the deficiencies in the remaining commitments.

NSRS reviewed a sample of the proposed FSAR revisions and found a number of inconsistencies. The problem was discussed with OQA; a program was instituted by OQA to address the NSRS concerns.

4. Task Force Category 5

Category 5 had 10 findings where procurement forms and flow diagrams specified different requirements for various valves and qualification documentation was not tied to the design and procurement process. The task force concluded this category required corrective action for future work and for past work as appropriate.

The underlying problem for this cateogry was a breakdown in the ECN process. Although some of the problems were attributed to the inappropriate use of S1 ECNs, some breakdown in the ECN, squadchecking, and signature process occurred. Although the task force identified two EPs being changed or issued, the procedures in place at the time that these problems developed were adequate if rigorously implemented. The NSRS agrees with the TVA and task force actions for this category.

5. Task Force Cagegory 6

Category 6 contains 7 findings of discrepancies between documents (analysis results, load tables, isometric drawings, flow diagrams, etc.) used in the design of piping systems. The task force found this category required corrective action for both past and future work.

The NSRS agrees in general with the TVA and task force conclusions for this category. But even though individual areas of the design may indeed have random and unique errors, an overview of these areas indicates a generic problem of implementation of procedures, attention to detail and lack of a really independent review process.

7. Task Force Category 7

Category 7 has 17 findings of nonconforming conditions in construction of previously inspected and accepted pipe supports. This set of findings required some modification to future activities; other TVA actions in place prior to the B&V findings are expected to resolve any deficiencies in completed work.

All of these items were due to the pipe supports in the field being different from what was shown on the drawings. In many cases there were ECNs and FCRs pending when B&V did their study. This resulted in drawings being different than field conditions because CONST had not made the modifications yet. Also, the NRC Bulletin 79-14 program, "walkdown," under WBN-QCP-4.56 had not been implemented when B&V did their study. The discrepancies probably would have been been corrected by the 79-14 program. There is no safety concern after implementation of the 79-14 program, and correction of any deficiencies found, which is required prior to unit fuel loading. The pipe supports would have been inspected, and the ones with problems would have been corrected.

7. Task Force Category 9

Category 9 has 8 findings of failure to adequately control and evaluate embedded plate capacity when multiple attachments were made to the plate by construction. The task force concluded that corrective actions already identified and scheduled would have resolved the deficiencies and that some modification to planned corrective action for future work is needed.

NSRS substantially agrees with the task force and EN DES responses and actions for this category except in the area of embedded strip plates.

The initial NSRS review and discussions with cognizant EN DES designers concluded the findings relative to the strip plates would not have been corrected by actions already identified nor would the deficiencies have been corrected by the corrective action plan identified. There is no control system to identify and maintain records of as built loads on the plates. With this lack of record or system, there is no way of knowing whether plates are overloaded.

NSRS has two points in question on this subject which lead to a direct safety concern:

 Although it was not discussed by B&V, the embedded plates have been analyzed with a "rigid" plate analysis as opposed to a "flexible" plate analysis. This can be an unconservative analysis. Of 69 cases that were checked, an anchor on one plate was shown to be stressed beyond the allowable stress in the acceptance criteria and a stiffener was added as in documented in the corrective action NCR WBN-CEB-82-02. This is a generic issue since all plates are analyzed in the same manner. It should be recognized that NRC has not fully accepted the TVA assumptions in response to IE Bulletin 79-02.

Of much greater concern is the control of attachments to embedded plates. There is no bookkeeping system to keep track of the cumulative load on any individual Construction Specification N3C-928 embedded plate. was implemented in February 1983 in response to the B&V findings to restrict locations of attachments. However, there was still no system established to identify and control the cumulative load on each plate. This specification should have been more restrictive. On January 6, 1984 revision 2 of N3C928 was issued which allowed the EN DES representative onsite "by visual examination" to determine whether a detailed evaluation of the plate is required. The representative has no guidelines or acceptance criteria, but uses engineering judgement. NSRS has serious concerns with this reduction in requirements. Black & Veatch had signed off on this finding on December 30, 1983 on the basis of the February 1983 revision of N3C-928. TVA relaxed the requirements in the specification seven days later. The only way to ensure that plates do not fail is to do an analysis using the actual loads or to compare the actual loads to the loads used in the prior analysis and show that the revised loads are within the envelop of the analyzed case.

Based upon the second concern, NSRS visited WBN to review the visual examination process. The EN DES representatives were actually checking loads against the allowables, not just visually examining; however, the results were not being documented. After the NSRS visit, OQA issued deviation report CO3-S-84-0089-DO1 and EN DES designers have agreed verbally with NSRS and in response to OQA for the deviation to revise Appendix 4 to EN DES EP 4.03 to document the field calculations as the basis of approval. This would eliminate our concern on the cumulative loads for attachments made under N3C-928.

NSRS has a residual concern for all the multiple attachments made prior to February 1983. The sampling of 69 plates revealed one plate with an overstressed anchor requiring a stiffener. The EN DES cognizant designers should consider taking a larger sample to gain greater confidence that all the plates are adequate. If the additional sampling is not

done, consideration should be given to performing a safety evaluation of the supported members with a basis of 1 to 1½ percent support failures since 1 in 69 of the embedded plates sampled had an overstress condition when compared to the allowable.

8. Task Force Category 11

Category 11 has 2 findings of inadquate documentation of operational modes data used in the analyses of piping systems. These findings were classified as deviations from the licensing commitments and bases and required corrective action for both past and future work.

A sampling program of rigorously analyzed piping was instituted to provide assurance that no design problems remained. Initially 20 problems were evaluated and none required reanalysis. The sample problems represent approximate: 10 percent of the total number of rigorously analyzed problems. Another 30 percent have been updated for other reasons and the proper operational mode data were included.

NSRS agrees with the TVA actions and conclusions for this category.

9. Task Force Category 12

Category 12 had one finding of failure by EN DES and CONST to properly implement and document the alternate analysis criteria for seismically supported piping. It was concluded that although there was a deviation from a licensing commitment, actions already being taken by TVA would have corrected the problem without reliance on the B&V study.

NSRS agrees with the TVA actions defined in EN DES SEP 8218 and SWP EP 43.21 dealing with alternate analysis problems and the task force conclusions.

10. Task Force Category 13

Category 13 had one finding in which termination information on documentation was in error and was not updated to reflect the actual configuration. The task force review concluded based on a sampling of 40 additional AFW termination records with no discrepancies that this finding was an isolated case and no further action is required.

NSRS supports this conclusion.

11. Task Force Category 14

Category 14 had 22 findings where various supports on the AFW system had not been modified, redesigned, or initially designed per revised analysis of ECN 2576. The task force concluded the findings were departures from licensing commitments and licensing bases. Corrective action was designated for both past and future work. The EN DES evaluation of the overallimplications of the discrepancies revealed that the problem was substantially isolated to the one ECN. A total of 5500 supports were reviewed--5000 in ECN 2576 and about 500 in ECN 3184 to support the conclusion. Although about 8 percent of the supports covered by ECN 2576 required some construction modification, only one support covered by ECN 3184 required construction modification which very strongly supports the conclusion that ECN 2576 was an isolated occurence albeit over an extended period of time.

An evaluation of the support deficiencies showed that the reserve stress in the pipe was not exceeded such that even through a support may have failed, the riping would not be overstressed. NSRS fully agrees with the task force and EN DES conclusions and corrective actions for this category.

12. Task Force Category 18

Category 18 had one finding where a technical note on a piping support drawing was found to be invalid for some applications. It was concluded that the finding condition was a deviation from a licensing commitment but the licensing basis was met. There was corrective action for future work; no modifications to existing support bolting was required.

NSRS agrees with the task force and EN DES evaluations and corrective action for this category.

13. Task Force Category 19

Category 19 had two findings where equipment could not be determined to be environmentally qualified to NUREGO588. These findings represented deviations from the licensing commitment; TVA already had a program in place which could have reasonably been expected to correct the problems.

NSRS agrees with the TVA conclusions for this category.

14. Task Force Category 20

Category 20 had five findings where, as stated by the task force, no procedure existed for documenting preoperational

testing determined time delay relay settings and the preoperational test scoping document did not identify or require documenting the settings. The task force classified the findings as deviations from the licensing commitments but the safety consequences were indeterminate. The task force documentation indicates the settings made prior to June 1983 were documented adequately by an interim memorandum (EEB 830614 439). The preoperation test scoping document and EN DES procedure SEP 83-11 have been written to require documentation of all the settings determined after June 1983.

The NSRS evaluations of this problem showed the scope to be greater than the task force addressed in this category since there appears to have been no effective control over time delay relays. Corrective actions for significant NCRs for these findings included procurement of new time delay relays to provide an adequate range. The existing relays would not allow setting the time called for on logic diagrams, hence the logic had not been properly implemented. This may be related to the lack of procedures governing logic diagrams (Category 3). The extent of the generic applicability review for this category is not clear to NSRS. The methods and procedures for determining the proper values, physically setting, and verifying time delay relay settings should be reevaluated and indicated changes should be expeditiously made TVA-wide.

15. Task Force Category 23

Category 23 has two findings related to the AFW turbine pump trip and throttle valve not being included on the active valve list and the valve schematic nct including the required control room bypass and test indication nor automatic bypass of the open torque switch. It was concluded the discrepancies were deviations from both the licensing commitments and bases. Corrective action was required for past and future work. The evaluation for cause concluded the deficiency was an isolated error resulting from failure to include the valve on the active valve list. Including the valve on the active valve list. Including the valve on the active valve list, providing the automatic torque switch bypass and providing the control room indication of bypass and test of the thermal overload correct the deficiency and the licensing requirements are met. The EN DES safety evaluation concluded the nuclear safety of the plant would not have been reduced if the deficiency had not been corrected.

NSRS agrees the corrective action taken is acceptable and the requirements are satisfied.

16. Task Force Category 25

Category 25 has one finding of flange evaluations being omitted in some analysis calculations. The task force concluded that the licensing commitment had not been met but evaluation showed the licensing basis was met. The corrective action included a 100 percent review of all completed calculations to assure flange qualification. Since the deficiency was attributed to individual errors, the corrective action for future work is to more clearly define the requirements.

NSRS agrees with the EN DES corrective actions and conclusions.

17. Task Force Category 30

Category 30 has two findings of failure to satisfy design criteria for (1) menitoring operability and (2) providing adequate electrical protective devices for the motor-driven AFW pump lube oil pump. The task force concluded the licensing commitment and the licensing basis were not met. The evaluation for causes revealed inadequate training and poor or lack of communications with NUC PR and EN DES. In reviewing other equipment, only one additional instance of failure to provide electrical protection was found. Thus the deficiency was not widespread. The EN DES safety evaluation of the two findings concluded there would be no safety concern had the defects not been corrected.

NSRS agrees with the specific corrective actions for the identified problems for this category.

18. Task Force Category 31

Category 31 has two findings of editorial discrepancies in licensing documents. The findings did not represent compromises of the licensing basis. The low number of errors found in this category support the conclusion that no action beyond correcting the identified errors is warranted, particularly in light of the extensive efforts detailed in Category 4.

NSRS agrees with the task force conclusions for this category.

19. Task Force Category 32

Category 32 has nine findings of incompatible hanger drawings and piping isometrics. The errors were deemed to be caused by checking and design verification of documentation between branches not being done as required by procedures.

The corrective action was to train designers in the procedural requirements. The errors did not result in any identified safety concerns since much of the work was not complete and system walkdowns could be expected to identify any incorrectly placed or installed supports.

NSRS has one residual concern with the EN DES corrective action. Since the root cause was inadequate training in procedure requirements, a continuing or periodic training program would appear to be needed. One time training is not felt to be totally adequate. Further, the corrective action was through SWP-AI1 R2, which appears to apply only to the Sequoyah/Watts Bar design projects not to TVA design projects in general.

20. Task Force Category 33

Category 33 has two findings of inadequate cable tagging. The two cited instances were the result of an oversight in one case (correct information, wrong color tag) and information being obscured on the tag due to wear and tear from rework in the other. No corrective action for past or future work was indicated since the frequency of occurence was low and walkthroughs are already designed to find and correct errors of this type. No safety concerns were expressed.

NSRS agrees with the task force conclusions for this category.

21. Task Force Category 34

Category 34 has 11 findings where "out of function" features of drawings were not in agreement with the latest design drawings showing the detailed design of the "out of function" features. The task force concluded that the "out of function" features do not impact the technical adequacy of drawings and are not used for design, construction or operation of the plant. No corrective action was deemed necessary.

NSRS agrees with the technical impact conclusions reached by the task force; our recommendation for Category 3 is equally valid for this category.

22. Task Force Category 35

Category 35 has one finding where instantaneous trip settings for motor-operated valve breakers were not in accordance with EN DES criteria and vendor recommendations. The task force concluded the licensing commitment and the licensing basis were not met and corrective action was required for both past and future work. The EN DES safety evaluation concluded:

While these high settings were found to violate good design practice and could lead to a motor control center failure, the high trip settings would not prevent the safe operation or the safe shutdown of the plant.

The basic cause of the deficiencies was lack of training and knowledge of changed requirements and expedient decisions not to correct deficiencies when the requirements were known not to have been met.

NSRS has substantial concerns with the EN DES and task force resolution of this finding category. First, the safety evaluation tabulates 444 breakers out of 610 having settings greater than 1300 percent of the motor full load current. Of the 444 breakers, 385 were either reset or replaced and set. The remaining 59 breakers were neither replaced nor reset and are still apparently not in compliance with the commitment to the requirements of TVA Design Standard E.9.2.1 (now superceded by a non-mandatory Design Guide E2.3.5, issued November 10, 1983) which references requirements of the National Electric Code (NEC). No justification was or has been documented for not resetting or replacing the 59 breakers. This misapplication of the NEC requirements as implemented by Design Standard 9.2.1 leaves TVA in noncompliance with the practices of industry as reflected in the NEC for motor circuit protection. This in turn places WBN in noncompliance with the FSAR commitment although the FSAR does not directly commit to the NEC, the Design Standard clearly does and the Design Standard has not been met in all cases.

A second and higher level concern is the failure of the cognizant EN DES personnel to properly consider applicable parts of the NEC. The EN DES safety evaluation very selectively quotes section 430-52 of the NEC by quoting an exception ". . . the setting of instantaneous trip circuit breakers shall in no case exceed 1300 percent of the motor full load current." Other parts of section 430-52 which are equally applicable state: "The motor branch circuit short circuit and ground fault protective device shall be capable of carrying the starting current of the motor. A protective device having a rating or setting not exceeding the value calculated according to the values given in Table 430-152 shall be permitted." The maximum allowed setting in Table 430-152 is 700 percent of the full load current of the motor. The full wording of the exception quoted in the safety evaluation is "Where the setting specified in Table 430-152 is not sufficient for the starting curren' of the motor, the setting of an instantaneous trip circuit breaker shall be permitted to be increased but shall in no case exceed 1300 percent of the motor full load current.

The expressed EN DES electrical design practice and philosophy are not in concert with present day nuclear design logic or common industrial practice. By NSRS reading, the stated EN DES positions do some injustice to the reasons for having protective devices of any sort. Clearly protective devices should be set as closely to normal operating conditions as possible while recognizing the full range of conditions including starting loads and avoiding nuisance trips. The NEC specifies this clear philosophy by using words such as "not exceeding" and "maximum" throughout. Table 430-152 of the NEC specifies 1300 percent to be the maximum exception. The NEC does not specify that all the breakers should or can be set at 700 percent or 1300 percent or any other given value.

The EN DES safety evaluation is incomplete in that the consequences of the pervasive nature of the deficiencies was not thoroughly considered. A worst case consequence was proposed which could lead to a fire which could disable a complete motor control center. It was further stated that the scenario, while possible, is so improbable as to be considered incredible. NSRS is concerned that broad conclusions have been reached with so narrow failure analysis and consequences determination being documented. The misapplication of the breakers exposes equipment to unnecessary challenge. These challenges can cause undetected failures which would not be seen during periodic testing. At the best, the deviations would have reduced safety margins even though single failure criteria may have been met; therefore, the deviations were significant to safety.

The instantaneous trip breakers should be verified to be set in agreement with the intent of the National Electric Code. The documentation for the design as well as for the testing and operations of the equipment should reflect the proper values. The program should be implemented TVA wide.

23. Task Force Category 36

Category 36 has one finding that the cable tray fill criteria are not assured of being met because of the less than conservative nominal values used for cable cross sectional areas in the cable routing program. After evaluation by designers, it was concluded that the licensing requirements had been met and no corrective actions are required for either past or future work.

NSRS does not agree that the licensing commitment has been met; it is not clear that the licensing basis has

been met. The WBN FSAR states that ". . .low-voltage power cable tray fill shall be limited to a maximum of 30 percent of the cross-sectional area of the tray, except when a single layer of cable is used. Cable tray fill for control and instrumentation cables shall be limited to a maximum fill of 60 percent of the cross-sectional area of the tray." The supporting EN DES documentation for the conclusion that the licensing requirements had been met was based upon considerations of dead weight, ampacity and heating value of combustibles in isulation and jacket materials. While NSRS agrees these are important considerations, there are others such as mechanical protection of the cables from missles or casual hazards.

The FSAR describes a fully automated computerized system to route cables and to control cable fill using the criteria stated above. There is not a variable to control for cables of the same guage but different diameter; there is no formal feedback procedure to alert the designer, when for vagaries of construction, that the tray is full physically before all the cables are installed as computer routed. Further, no acceptance criteria have been provided for either the installer or a QC inspector to use to consistently determine that a tray is physically full.

Although not a part of the findings in task force Category 36 additional conditions adverse to quality noted by NSRS during a field trip to WBN to observe the cables in cable trays were:

- Excess cable coiled and hanging from edges of cable trays.
- Excess cable coiled and lying on the floor where people have to walk to access areas of the plant.
- 3. No record of megger test results for cables.

EN DES should develop acceptance criteria to be used by construction forces as well as the QC inspectors which define fill in measurable terms to supplement the arithmetical computer methodology. The additional problems above must be resolved. Until these deficiencies are corrected, TVA can not adequately justify that the licensing requirements are satisfied in full. NSRS believes safety evaluations should be made of the conditions described prior to substantial plant operation.

24. Task Force Category 37

Category 37 has one finding where valve wiring circuits were designed such that the red and green indicating lights on the unit control board would light dimly upon malfunction of the PAuto contact of the Westinghouse W2 control switch on the unit control board. It was concluded the design did not satisfy either the licensing commitment or basis and corrective actions were taken. EN DES recognized the requirement; however, the failure was a random design error in conjunction with inadequate design verification. The circuits with W2 switches were reviewed and the deficiencies were corrected when found.

NSRS agrees with the EN DES corrective action taken.

25. Task Force Category 38

Category 38 has two findings of failure of the thermal overload bypass circuit designs to meet the requirements of RG 1.106 and IEEE 279-1971. The task force concluded the licensing basis had been met and no corrective action was required.

NSRS agrees with the EN DES and task force resolution for this category.

26. Task Force Category 39

Category 39 has one finding where the specific configuration of 6.9kV bundled cables in trays had not been tested for the effects of fire retardant coating on the ampacity of the cable. The task force concluded the licensing commitment had not been met but the basis had been satisfied. An evaluation of the condition was prepared as part of the policy committee activity and was presented to NRC for acceptance.

NSRS agrees with the conclusions and actions taken by EN DES and the task force for this category.

SUBJECT: WATTS BAR NUCLEAR PLANT - NSRS ROUTINE REVIEW OF THE RESPONSE TO NSRS REPORT R-84-19-WBN, ASSESSMENT OF THE RESULTS OF THE B&V INDEPENDENT DESIGN REVIEW OF THE WBN AUXILIARY FEEDWATER SYSTEM - NSRS REPORT NO. R-84-26-WBN

> Attached is the NSRS report for the routine review of the response to NSRS report R-84-19-WBN. The purpose of this review was to examine the response provided in a memorandum from H. G. Parris to me dated July 31, 1984 (EDC 840801 601).

> Of the seven recommendations, NSRS considers four of the items satisfied. It is noted that while the action taken to resolve item R-84-19-WBN-01 was considered appropriate for WBN, the item addressed all TVA plants. This was not understood by your organization and the response only addressed WBN. It is understood that all of the TVA plants are reviewing the item for generic implications and responses are expected.

> NSRS does not concur with the response provided for recommendations R-84-19-WBN-06 and -07. As a result, the NSRS has recommended what action is considered to be necessary to satisfy the initial recommendation. This should be sufficient for the staffs to reach agreement on a specific course of action.

> Within 30 days of receipt of this report, please provide us with the proposed corrective action including the expected implementation date for the three open items.

> > H. N. Culver

Ι.	PURPOSE AND SCOPE	1
II.	SUMMARY AND CONCLUSIONS	ı
II.	STATUS OF PREVIOUSLY IDENTIFIED ITEMS	1
IV.	PERSONNEL CONTACTED	5
V.	DOCUMENTS REVIEWED	6

B. <u>R-84-19-WBN-02</u> (Category 9)

This item is satisfied since NSRS concurs with the action specified in the memorandum mentioned above (EDC 840801 601).

C. <u>R-84-19-WBN-03</u> (Category 9)

This item is satisfied since NSRS concurs with the action specified in the memorandum mentioned above (EDC 840801 601).

D. R-84-19-WBN-04 (Category 20)

This item is satisfied. The NSRS recommendation that a review of time-delay relay settings procedures should be determined for all plants has been satisfied in large measure by work done under SEP-83-11 and work reflected in the memorandum from F. W. Chandler to H. L. Jones (EEB 831125 436). These documents provide satisfactory evidence for WBN and BLN time-delay settings. NSRS has reviewed the BLN design approach in which critical control functions are handled by solid-state logic (SSCS) with predetermined settings in all instances by the designers, and conclude that the program problems discovered by B&V on WBN do not apply to BLN.

E. R-84-19-WBN-05 (Category 34)

This item is satisfied. This category contained II findings where "out of function" features of drawings were in error (i.e. these drawings were not used to construct the feature, and drawings which were used differed because of changes or updating). Given the increased emphasis on training and the guidance by checklists and greater detail given in the EPs (EP 3.10 and EP 4.01 for example) now, there is no reason to believe that "out-of-function" features will be in error in the future to the degree that B&V found. In light of this information, NSRS does not believe there is a problem with "out-of-function" elements with the possible exception of old drawings which have not been through a change cycle recently. As noted by EN DES following their review of B&V findings, there were no significant user problems due to the errors found so far, so a special program to review all drawings for this type of error is probably not justified. No corrective action is necessary.

F. R-84-19-WBN-06 (Category 35)

This item is considered to remain open since the response presented in the memorandum from H. G. Parris to H. N. Culver dated July 31, 1984 (EDC 840801 601) and memorandum from J. C. Standifer to R. A. Coster dated July 18, 1984 (WBP 840718 076) is considered to be insufficient. The basic NSRS concern is that the 480-volt motor branch protection is not being performed in accordance with the National Electric Code (NEC). The response verifies this and is unacceptable for the following reasons.

 The memorandum from J. C. Standifer (WBP 840718 076) states in part:

Subsequent to the evaluation of the Task Force Category 35 finding, Design Standard DSE9.2.1 was replaced by DGE-2.3.5. This occurred on November 10, 1983, and negates the requirement to comply with the National Electrical Code. Design Guide DGE-2.3.5 references the National Electrical Code but the final decision in complying with the National Electrical Code is left up to the discretion of the designer per the definition of design guides.

NSRS considers it to be inappropriate to change a design standard to a design guide to resolve the conflict and leave the compliance to the discretion of the designer. The NEC, as with all nationally recognized codes and standards, represents the collective body of knowledge, experience and accepted design practice of the industry. Considering the safety significance of the application it is not considered to be appropriate to let designer discretion be the final authority.

2. The design guide does not appropriately implement the NEC requirements for instantaneous trip circuit breaker settings. Table 430-152 of the NEC states that the maximum rating or setting for instantaneous trip breakers for motors (other than dc constant voltage) shall be 700 percent of full-load current. An exception being that:

Where the setting specified in Table 430-152 is not sufficient for the starting current of the motor, the setting of an instantaneous trip circuit breaker shall be permitted to be increased but shall in no case exceed 1300 percent of the motor full-load current.

As stated, the 1300 percent setting can be used only if the setting is not sufficient for the starting current of the motor. The TVA Design Guide DG-E2.3.5, Table 1 recommends 7 to 13 times motor full-load current and to follow manufacturer's recommendations. The guide is not in compliance with the NEC since no mention is made on designing to the 700 percent and by exception permit settings up to 1300 percent of full-load current.

The TVA design guide DG-E2.3.5 states in part:

Table 1 (end of text) does not include overload protection, which must be selected in accordance with NEC Article 430, Part C (see section 1.2). Table 1 is based on the requirements of NEC table 430-152 (see section 1.3) and motor data included

in NEC table 430-150 for three-phase induction motors, full voltage starting, and motors with NEMA code letters F through V, or without code letter. The table shows maximum values, but does not include allowances for exception of NEC section 430-52 which, when required, should be used with discretion. The fuse ratings in the table are based on fuse manufacturers' recommendations corresponding to the foregoing code requirements.

Contrary to the statement of not including allowances for exceptions, the table permits the use of the NEC 1300 percent of full load currents as standard design guidance.

Based upon the above discussion, NSRS does not agree that this recommendation is satisfied until the following is completed:

- Design Guide DG-E2.3.5 is made a mandatory Design Standard.
- The Design Standard invokes the instantaneous trip circuit breaker setting requirements of the NEC from Table 430-152 and properly implements the exception clause.

G. R-84-19-WBN-07 (Category 36)

The item is considered to remain open since the response presented in the memorandum from H. G. Parris to H. N. Culver dated July 31, 1984 (EDC 840801 601) is considered to be insufficient.

Our root concern as raised in R-84-19-WBN, section IV.B.23, and as summarized in the recommendation section, III.G, was that there did not appear to exist criteria that could be used by the field personnel to evaluate the adequacy of the work that was being performed or that could be used by the QC inspection units to determine that the final installation was acceptable. This concern, which is stated in R-84-19-WBN, relates to the fact that TVA in its FSAR committed that:

. . . low voltage power cable tray fill shall be limited to a maximum of 30 percent of the cross-sectional area of the tray, except when a single layer of cable is used. Cable tray fill for control and instrumentation cables shall be limited to a maximum fill of 60 percent of the cross-sectional area of the tray.

It was recognized by NSRS that TVA uses a computerized system to route cables and to limit the fill in the cable trays. Although this system is used to assist and to document what was actually accomplished in the field, the computer system cannot be used as a final acceptance vehicle without some verification of what exists in the field.

The response to R-84-19-WBN-07 presented by the line organization relates to a concern that is not even identified by NSRS in its report. The recommendation made by NSRS relates to establishing design criteria and providing the field with the acceptance criteria both for installation and QC inspection.

As has been stated previously, the concern raised regarding the cable routing system was raised when NSRS observed that cabling in many areas exceeds the height of the side rails of the cable trays, even though the tray proper seems (in most cases) to have sufficient area to lay cable below the side rails. This physical condition at the plant also negates the natural protection the cable receives from the side rails, thereby unnecessarily exposing them to damage. NSRS recognized that the NEC did not specify tray fill criteria until 1975. However, our discussions with peers in the industry (Bechtel, Stone and Webster, Sargent and Lundy) revealed that tray fill was generally 1 ed to 80 percent and in no case were cables allowed to protrude above the side rail, the exception being where a "side board" could be added to accommodate a tray cover. Since we are not using "side boards" and covers for the Watts Bar trays, it would appear that our cabling in many areas is unnecessarily exposed to damage and is not consistent with standard industry practice.

TVA has recognized this inconsistency and has revised the TVA General Construction Specification G-38, section 3.2.1.3, paragraph b, which states in part:

Beginning with Bellefonte Nuclear Power Plant, cable trays must not be filled above the side rails except at intersections and where cables enter or exit the tray.

To satisfy the recommendation NSRS considers the following should be performed:

- a. Develop criteria for field use to control <u>actual</u> tray fill levels and to provide a basis for QC inspection.
- b. Either QC or the appropriate QA organization should through an inspection and/or audit process determine if the existing installation meets the established criteria.
- c. Where deviation from the FSAR commitment are made, TVA should perform a safety analysis to justify the deviations. Such deviations should be examined for reportability to NRC.

MUCLEAR CAPETY REVIEW STAFF (MSRC) ASSESSMENT OF THE RESULTS OF THE BLACK AND VEATCH (EAV) INDEPENDENT DESIGN REVIEW OF THE WATTS BAR MUCLEAR PLANT (LEN) AUXILIARY FEEDWATER SYSTEM - MSRS REPORT NO. R-84-19-VEN (REF: MEMO, HMC TO HCP, 7/5/84) (CNS 840705 853)

The purpose of this memorandum is to provide you with our response to the recommendations in the subject report. The attachment provides the specific details in response to your recommendations.

Our response provides you with some details wrich apparently were not provided to you during your review. These details have already been presented to your staff in a meeting on July 25, 1924. We believe that these additional details will alleviate the concerns of your staff. Additionally, we have confidence in our deviation control/corrective action system, such that those items which have previously been identified and which are in the process of being corrected should not be considered open concerns of the MCRS.

We believe this response and the consistents accountely address the concerns of your staff, and all findings can be closed. Any questions concerning this response chould be addressed to J. A. Thompson of the Project Lanager's organization (UPN) at extension 148-324-K.

RESPONSE TO NSRS RECOMMENDATIONS REPORT NO. R-84-19-WBN

R-84-19-WBN-1 (category 3) and R-84-19-WBN-5 (category 34) -- These two recommendations will be combined in one response.

Concern: Superfluous and discrepant information is known to exist on drawings with no planned corrective action.

Response: We agree that this condition exists; however, we do not agree that the condition has a detrimental effect on quality. As part of the response to the Black and Veatch findings, a study was conducted of the problem areas (electrical and instrumentation) to determine the effect of discrepant information on the actual work being performed. It was determined that the users of the design information were in fact utilizing the drawings with the correct information. The only exception to this conclusion was the use of logic drawings. EN DES has completed corrective action by reviewing all logic drawings to remove discrepant information; this was documented on ECN 4666, which is closed.

We are confident that our design review process has improved due to management emphasis and training on the requirements of EP 3.10 and 4.01, such that present and future work will not contain the same problems identified by this concern. We also believe that the corrective action for past work constitutes appropriate corrective action for the achievement of quality.

R-84-19-WBN-2 (category 9)

Concern: EN DES personnel at the site are not documenting their field calculations which support the visual examinations of attachments to embedded plates.

Response: We agree with your concern, and EN DES is in the process of correcting this problem. We do not believe that this problem should be tracked as an open NSRS concern, since we have the item tracked in our own deviation control/corrective action system through the Office of Quality Assurance deviation report No. C03-S-84-0089-D01.

R-84-19-WBN-3 (category 9)

Concern: The corrective action on one plate from the sample of 69 plates would indicate a 1- to 1-1/2-percent failure rate, which is not acceptable.

Response: We do not agree with your concern for the following reasons:

- 1. The sample of embedded plates was not a random sample. The sample was selected by EN DES personnel, using engineering judgment to visually examine and select the embedded plates with the highest loading in predetermined areas of high-loading potential. This type of sampling process provides a much higher degree of confidence in the statistical analysis.
- 2. The one plate--which had a stiffner added--was analyzed to have a stress of .96 yield, which is above the design limit of .9 yield. Although the stress was a failure to meet design limits, it was not considered to be a failure in material yield. This entire evaluation was documented on an EN DES Nonconformance Report No. WBNCEB8203, which was reported to the NRC as a 50.55(e), and has been reviewed and closed by the NRC.

Based on the above reasons, we have a very high degree of confidence that the attachments to embedded plates made prior to February 1983 are acceptable.

R-84-19-WBN-4 (category 20)

Concern: The problems encountered with time delay relay settings at WBN should be expeditiously evaluated for needed changes at the Bellefonte Nuclear Plant (BLN).

Response: We do not agree with your concern. The problems at WBN were evaluated for BLN as part of the Black and Veatch generic review, and it was determined that BLN did not have the same problem. This is documented in a response to the Task Force from the Electrical Engineering Branch dated November 25, 1983 (EEB831125936).

R-84-19-WBN-6 (category 35)

Concern: Fifty-nine breakers are in noncompliance with the intent of the National Electric Code, with no documented justification; and a nonmandatory design guide now supersedes the previous mandatory design standard.

Response: We agree with your concern. The planned corrective action for the 59 breakers--which was to be implemented in response to the Black & Veatch finding--was not being implemented. This was identified and reported to EN DES by OQA (OQA840504508, dated May 4, 1984). EN DES is in the process of correcting the situation and has responded to OQA (WBP840718076, dated July 18, 1984). We do not believe this concern should be tracked as an open NSRS item, since we already have the problem identified in our deviations control/corrective action system.

R-84-19-WBN-7 (category 36)

Concern: No documentation exists to verify that cable tray fill levels

are not exceeded.

Response: We do not agree with your concern on cable tray fill documenta-

tion. The documentation of cable tray fill exists in the fully automated computerized system to route the cables. The program is a living document which will be used for the life of the plant. Documentation via a computer printout is available at any time for any node point on any cable tray. We do not believe that is practical nor possible for a QC inspector to verify and document cable tray fill. Our computer system is controlled by WBP-EP-43-13. We have submitted a change to the FSAR (amendment 52) to explain the use of nominal cable diameters in our cable tray fill calculations. We believe no further action is required in this area. Additionally, the Office of Quality Assurance has scheduled a verification activity for this process, which will be conducted during the fourth quarter

of their verification schedule.

SUBJECT: RELLEFONTE NUCLEAR PLANT - NEED FOR INDEPENDENT DESIGN REVIEW

References: (1) H. N. Culver to H. G. Parris memo dated July 5, 1984,
NUCLEAR SAFETY REVIEW STAFF (NSRS) ASSESSMENT OF THE
RESULTS OF THE BLACK AND VEATCH (B&V) INDEPENDENT
DESIGN REVIEW OF THE WATTS BAR NUCLEAR PLANT (WBN)
AUXILIARY FEEDWATER SYSTEM - NSRS REPORT NO. R-84-19-WBN

(GHS 840705 053/A02 840709 007)

(2) Telephone message from General Manager's Office to C. F. McBride's office regarding Board member comment on reference 1 (A47 840713 010)

Per your request of July 17, 1984, I have reviewed the reference 1 memorandum and attached report in light of the Board member comment and submit the following comments and conclusion regarding further reviews of the Bellefonte project.

- 1. In 1982 after NRC Chairman Palladino's address to the AIF meeting in San Francisco regarding the need and responsibility for the utilities to clean up their act and begin to police themselves, there were two main utility responses to this charge. Near-term operating license applicants would opt for the independent design review, such as the B&V review of Watts Bar, and those not so near term would subscribe to and embrace the Institute of Nuclear Power Operations (INPO) program for independent reviews.
- In harmony with no. 1 above, OEDC management made a conscious decision to execute the independent design review for Watts Bar and to utilize the INPO program for BLN.
- 3. The independent review conducted by B&V on Watts Bar consisted of a vertical slice of design and construction activities. The review was conducted on a selected system to provide a comprehensive assessment of TVA's design and construction activities at Watts Bar and to provide additional confidence to TVA and others in the adequacy of the plant. This vertical slice confirmation of the adequacy of the selected system coupled with broader, more comprehensive programmatic reviews (e.g., NSRS reviews) was to provide TVA with additional confirmation that Watts Bar was, in fact, designed and constructed adequately even though deficiencies in the QA program have been identified and resolved.

This independent review was executed on Watts Bar and the generic findings and any other important or significant findings were evaluated by the Bellefonte project and corrective actions initiated and implemented. This effort was accomplished under the oversight of the TVA B&V Review Task Force.

H. G. Parris

BELLEFONTE NUCLEAR PLANT - NEED FOR INDEPENDENT DESIGN REVIEW

- 4. A self-initiated evaluation (SIE) of the Bellefonte design and construction program was conducted in the fall of 1982. The performance objectives and criteria developed by INPO were used for evaluation of the design and construction programs. The evaluation was performed by a team of senior technical and management personnel from Duke Power Company and TVA with INPO observers. The evaluation of the design and construction programs primarily concentrated on those areas for which TVA engineering and design organizations had direct responsibility and concentrated on the activities being performed at the construction site. The evaluation covered: (1) the design controls established by TVA for specifying design requirements, (2) the implementation of those controls by the engineering organizations, (3) the programs and policies at the construction site which ensure design requirements are fulfilled and (4) the performance of activities at the construction site which ensure that a quality end product is achieved.
- 5. Also in the fall of 1982 the Bellefonte project was subjected to an indepth evaluation by the NRC Construction Appraisal Team (CAT). This team consisted of senior NRC personnel from their central staff supplemented by Regional office personnel and consultants in specialty areas. The objective of this evaluation was to evaluate the adequacy of construction, the quality assurance program, material traceability, and procurement for the Bellefonte project. Within the areas examined, the review consisted of detailed examination of selected hardware subsequent to final TVA quality control inspections, a selective examination of procedures and representative records, observation of in-process work and interviews with management, inspectors, and craft personnel. For each area inspected, the following was determined:
 - a. Is the hardware/product fabricated/installed as designed?
 - b. Do individuals who have been assigned responsibilities in a specific area understand their responsibilities?
 - c. Are quality verifications performed during the process with applicable hold points and conducted to adequate inspection/acceptance criteria?
 - d. Do personnel involved with Quality Assurance/Quality Control have the organizational freedom to perform their tasks without harassment or intimidation?
 - e. Are management controls established and implemented to control activities in each area?
- 6. INPO conducted an evaluation of the Bellefonte project in early 1984. This evaluation team consisted of permanent INPO personnel and utility loanees. Their objective was to evaluate the control of design and construction processes and to identify areas needing improvement. The team examined organization and administration, design control, construction control, project support, training, quality and test control. Actual work and test performance are observed. A portion of the evaluation focused on a detailed examination of several stages of a

U6 4205.01

H. G. Parris JUL 30 1984

BELLEFONTE MUCLEAR PLANT - NEED FOR INDEPENDENT DESIGN REVIEW

single process (a vertical look at design control and implementation) plus a review of several similar activities at one stage of the process (a horizontal look).

- 7. There is a very distinct possibility that BLN will be subjected to a NRC Design Appraisal Team Review (DAT) between now and fuel loading. This review basically performs the same type review performed by B&V.
- 8. There will be at least two more INPO evaluations of the Bellefonte project prior to fuel load of unit 1. Through personal observation of and conversation with Zack Pate regarding the improved quality and thoroughness of the design portion of the INPO evaluation, these should be sufficient to ferret out any design problems that we may have.
- 9. Per conversation with Cantrell and Dilworth, it is the intention of Engineering to perform inhouse reviews of the horizontal and vertical type to assess the design process. This was a recommendation of David Smith (INPO) to G. Dilworth in a recent meeting at INPO headquarters. Engineering will utilize personnel who have been loanees to INPO to lead these efforts. It is INPO's opinion that a proper mix of inhouse trained and directed personnel can more efficiently and effectively perform this type of review than can an outside firm.

I have discussed with Cantrell, Dilworth, and Beasley (Engineering), Culver (NSRS), Zack Pate (INPO), and Dave Verili (NRC Region II) the merits of performing the independent design review at an earlier timeframe in the design/construction process. In light of this, we have considered our existing commitments for future reviews and evaluations and our actions taken at Bellefonte in response to the B&V review, CAT appraisal, and INPO evaluations. Based on these discussions and considerations, we believe the Bellefonte project will have been subjected to substantially more comprehensive and independent review than that performed at Watts Bar as a near-term operating plant. Consequently, I will not recommend the use of an additional independent design review for Bellefonte.

SUBJECT: BROWNS FERRY NUCLEAR PLANT - BLACK AND VEATCH FINDING R-84-19-WBN-01 (TASK

FORCE CATEGORY 3)

84092710067 1

Reference: Your endorsement to me dated September 12, 1984 (QMS 840912 201)

The status and plan for category three, logic/control drawings do not agree with electrical wiring drawings, is given below:

1. Evaluation

Review of EECW electrical drawings (as a sample) revealed discrepancies among the logic/control drawings and the wiring drawings. The discrepancies found indicate documentation only changes are required for all systems. The wiring drawings were used in construction and modifications, thereby assuring proper plant configuration. However, both plant and design personnel presently use both control/logic and wiring drawings for determining system operation; and therefore, the drawings should be made to agree. No plant modifications are expected.

2. Recommendation

Perform a dedicated review of all systems (approximately 75) and correct any discrepancies between drawings. Discrepancies on current and future work are being corrected as they are identified.

3. <u>Plan</u>

Scoping and a cost estimate to perform a dedicated review of these systems will begin on September 24, 1984. Six weeks will be required to complete this estimate. Additional authorization from NUC PR will then be required to perform the review.

SUBJECT

BROWNS FERRY, SEQUOYAH, AND BELLEFONTE NUCLEAR PLANTS - NSRS REPORT NO. R-84-26-WBN - ITEM R-84-19-WBN-01

Reference: Your memorandum to R. M. Pierce dated September 5, 1984 (GNS 840906 101)

132

This memorandum provides a response to this item as requested in the reference. Separate memorandums from R. M. Pierce address items R-84-19-WBN-06 and R-84-19-WBN-07.

Item R-84-19-WBN-01 concerns discrepancies between logic/control drawing and detailed electrical drawings. The specific status of corrective action on these plants is listed below:

Browns Ferry

A review of a sample of electrical drawings from Browns Ferry revealed discrepancies among the logic/control drawings and the wiring diagrams. The discrepancies found indicate that only documentation changes are required. The documentation changes are required as both the operating and engineering personnel presently use both the logic/control and wiring diagrams for determining system operation and design evaluation and changes. The plant configuration is considered acceptable as the construction and modifications are based on wiring diagrams.

OE is developing a scope and cost estimate for a dedicated review of all systems on Browns Ferry. This scope and estimate are scheduled to be completed about mid-November 1984. After that, NUC PR will be requested to authorize the work and provide funding for corrective action. Additional detail can be obtained from a memorandum from N. R. Beasley to E. G. Beasley dated September 21, 1984 (BFP 840921 019).

Bellefonte

During 1981 inconsistencies between Bellefonte electrical drawings and Bellefonte design criteria were identified. A nonconformance report was issued. Corrective action for the nonconformance report was to review FCLDs, schematics, design criteria, and wiring and connection diagrams to ensure that all were mutually consistent. Corrective action has been completed and the nonconformance was closed on July 5, 1983 (BLP 830705 019). Additional detail can be obtained from a memorandum from R. M. Hodges to J. A. Raulston dated September 14, 1983 (BLP 830914 013).

BROWNS FERRY, SEQUOYAH, AND BELLEFONTE NUCLEAR PLANTS - NSRS REPORT NO. R-84-26-WBN - ITEM R-84-19-WBN-01

Sequoyah

The condition has not been specifically evaluated for Sequoyah, and we do not know for certain that the condition exists. OE is pursuing the situation as part of the generic applicability of the overall Black and Veatch review. A specific evaluation will be required to establish whether or not the condition exists with the Sequoyah electrical drawings, and if the condition does exist the extent and seriousness. We consider it fairly high probability that the condition does exist at Sequoyah and that the condition is not serious. OE is keeping this Black and Veatch category open for Sequoyah and will reiterate our request to NUC PR to provide authority and funds for the specific evaluation and then for corrective action if necessary.

We agree with the NSRS position that the condition should be evaluated for all plants. The results of the evaluation and corrective action are defined and the item is satisfied for Browns Ferry and Bellefonte. The item should remain open for Sequoyah. We will inform you when the review is complete and any necessary corrective action defined and in a corrective action system.

BELLEFONTE NUCLEAR PLANT UNITS 1 AND 2 GENERIC IMPLICATIONS OF FAILURE TO IMPLEMENT DESIGN CRITERIA IN DESIGN DRAWINGS 10CFR50.55(e) REPORT NO. 7 (FINAL) NCR BLNQAB8101

Description of Deficiency

Various functional control logic diagrams (FCLDs) and the associated wiring diagrams do not adequately reflect design criteria requirements. Nonconformance reports are initiated when a drawing discrepancy is found, and as a result, the following nonconformances were writen: BLWBLP8003, BLWBLP8010, BLWBLP8101, and BLWBLP8016. These design discrepancies were discovered when reviewing designs to make revisions.

Due to the apparent trend in failing to properly reflect the design criteria in these design drawings, the subject nonconformance was written to identify the possible programmatic deficiency in the production of the drawings. The cause of this deficiency was determined to be random errors occurring during the design review process.

Safety Implications

Failure to properly reflect design criteria in design drawings could result in the deficient design and construction of safety-related structures, systems, and components, thereby adversely affecting the safety of operations of the plant.

Corrective Action

A review to assure compatibility between the design criteria and the functional control logic diagrams (FCLDs) produced by the Electrical Engineering Support Branch (EEB) has been completed. The review compared the FCLDs with their respective design criteria and the outcome of the review was the identification of several discrepancies. The following NCRs were initiated as a result of the review:

BLPBLP8106 BLPBLP8110 BLPBLP8118 BLPBLP8119 BLPBLP8222 BLPBLP8235 BLPBLP8312 BLPBLP8321

The corrective action for each discrepancy identified is an FCLD revision followed by a revision of the corresponding wiring diagrams (if applicable) since the FCLDs establish instrumentation and control requirements that are implemented by the wiring diagrams. Prior to the FCLDs being transferred to project, the standard procedure was to design and check/verify the

Corrective Action (Continued)

electrical wiring diagrams to the applicable FCLD and design criteria. Now the standard procedure is to design and check/verify the FCLDs to the applicable design criteria and then design/check/verify the electrical wiring drawings to the FCLDs and design criteria.

The FCLDs for Bellefonte Nuclear Plant were produced and revised by the Electrical Engineering Support Branch until the latter part of 1980. The responsibilities of following the changes on this project as well as several other projects, apparently resulted in an inadequate design review. The responsibility for the FCLDs was transferred to the project and design reviews are now performed by project on the FCLDs as well as all other drawings. The identified errors were of a random nature and do not indicate a generic problem.

WATTS BAR NUCLEAR PLANT - NSRS ROUTINE REVIEW OF THE RESPONSE TO NSRS REPORT R-84-19-WBN, ASSESSMENT OF THE RESULTS OF THE B&V INDEPENDENT DESIGN REVIEW OF THE WBN AUXILIARY FEEDWATER SYSTEM - NSRS REPORT NO. R-84-26-WBN

RESPONSE TO RECOMMENDATION R-84-19-WBN-06

841015H4542

The response to R-84-19-WBN-01 has been transmitted to you by memorandum from R. W. Cantrell dated October 1, 1984 (QMS 840928 201). The response to R-84-19-WBN-07 will follow by separate transmittal from me.

Please refer to your memorandum to me dated September 5, 1984, transmitting NSRS report No. R-84-26-WBN. This report states that NSRS does not agree that recommendation R-84-19-WBN-06 (concerning application of National Electric Code requirements to 480-volt motor branch protection) is satisfied until:

- 1. Design Guide DG-E2.3.5 is made a mandatory design standard, and
- 2. The design standard invokes the instantaneous trip circuit breaker setting requirements of the National Electric Code from Table 430-152 and properly implements the exception clause.

Design Guide DG-E2.3.5, "480-Volt Motor Branch-Circuit Design and Protection," is generally tutorial and is not suited for conversion to a design standard. However, revision 1 of DS-E2.3.2, "480-Volt AC Auxiliary Power System Performance and Equipment Application Criteria," does require application of sections 2 and 9 of DG-E2.3.5 to motor branch-circuit protection.

These sections deal with maximum ratings of and setting for motor branch-circuit protective devices, and are based on the National Electric Code. Although the code does not apply to power generation facilities, its requirements can be applied to most of our power plant circuits. Design Guide DG-E2.3.5 was developed specifically for power plant application, and while it does not specifically invoke the instantaneous trip circuit breaker setting requirements from Table 430-152 of the code, it does present applicable and adequate guidance for motor branch-circuit protection.

Primarily, DG-E2.3.5 recognizes that good design practice and compliance with section 110-10 of the NEC requires that the selected overcurrent device not only has sufficient interrupting capacity rating, but that it also protects the circuit components under short-circuit conditions. This criteria must be met in ways that allow maximum assurance against motor nuisance tripping. DS-E2.3.2, in referencing section 2 of DG-E2.3.5, requires that the circuit designer consider actual motor data, drive

H. N. Culver October 4, 1984

WATTS BAR NUCLEAR PLANT - NSRS ROUTINE REVIEW OF THE RESPONSE TO NSRS REPORT R-84-19-WBN, ASSESSMENT OF THE RESULTS OF THE B&V INDEPENDENT DESIGN REVIEW OF THE WBN AUXILIARY FEEDWATER SYSTEM - NSRS REPORT NO. R-84-26-WBN

RESPONSE TO RECOMMENDATION R-84-19-WBN-06

application, and manufacturer's recommendations to obtain optimal settings for instantaneous trip circuit breakers.

At WBN these considerations resulted in setting all instantaneous trip circuit breakers as near 13 times full load current as possible without exceeding that value. This decision was based on the following information:

Actual motor starting current for typical motor control center loads averaged between six and eight times full load current. Asymmetrical current due to inductive loading can increase this value to a maximum of 1.73 times symmetrical starting current. Molded case circuit breakers typically operate in 10 to 15 milliseconds and consequently trip due to the asymmetrical current value.

Additionally, rated motor data for WBN low voltage power system loads is typically given at 460 volts. In reality, this equipment can normally be operated at up to 110 percent of rated voltage. During motor starting, this increased voltage causes a directly proportional increase in starting

Finally, motor control center loads subjected to slow bus transfer generate internal voltages which add directly to the externally supplied voltage. This condition also directly increases motor accelerating current. Bus transfer test data for medium voltage motors at WBN has shown this value to approach three times locked rotor current. This condition has resulted in resetting instantaneous trip relays for medium voltage motors.

The above factors, when considered concurrently, necessitate a typical setting of 11 to 13 times full load current. This value approximates the manufacturer's recommended setting of 11 times full load current.

This position was discussed with your J. F. Murdock and J. D. Smith by G. R. Reed and W. M. Roop, Jr., of the Electrical Engineering Branch on September 20 and 21, 1984.

IMPACT AND JUSTIFICATION FO	ORM
I	VA ECH No. 2576 J No. 694 ute ///3/80
1. Description of Proposed Change Addition of pipe Su	poort numbers
to the highwas Analysis drawings	
·	
ann!	
Originator /	X
2. Category:	
1. Proposed ECN essential for unit operation and may no until after unit operation license.	ot be deferred
2. Proposed ECN affects plant operating reliability and Proposed ECN implementation may be deferred until af license.	
3. Proposed ECN is to improve plant operating flexibilitience. Proposed ECN implementation may be deferred operation license.	
3. Justification for Selection of Category This clocuman	to tion will
be used by Coast to Lacilitate the	
of Support and anchor locations for	1/arigos
piping systems	
Proceed With Further Consideration as Category 1, 2, or	r 3 (circle one)
Do Not Proceed With Further Consideration

PURPOSE AND SCOPE

The NSRS performed an assessment of the results of the Black and Veatch (B&V) Independent Design Review of the Watts Bar Nuclear Plant Auxiliary Feedwater System and documented the results of the review in NSRS Report R-84-19-WBN dated July 5, 1984. The report provided five recommendations and requested that NUC PR provide NSRS with a plan of action to respond to the recommendations. The memorandum from H. G. Parris to H. N. Culver dated July 31, 1984 (EDC 840801 601) provided the response to the recommendations and stated that all findings could be closed. This report provides the results of the NSRS evaluation of the response and provides the status of the recommendations.

II. SUMMARY AND CONCLUSIONS

As a result of the review, the NSRS has determined that adequate corrective action has been completed to satisfy four of the seven recommendations. NSRS has also determined that the response to three recommendations provided insufficient corrective action to warrant closeout.

III. STATUS OF PREVIOUSLY IDENTIFIED ITEMS

All of the responses to the seven recommendations made in the nemorandum mentioned above (EDC 840801 601) were examined. Based upon the review, four of the recommendations are satisfied and three remain open. The details of the NSRS action follow:

A. R-84-19-WBN-01 (Category 3)

This recommendation was not fully complied with since it referred to all TVA plants and the response only addressed WBN. As part of this follow-up review, NSRS has examined a number of drawings which were changed under ECNs 4666 and 4667. The changes appeared to clarify and correct the drawings listed. A large number of logic and control drawings were changed. Therefore, NSRS considers this issue satisfied for WBN due to the corrective actions taken and verified. The extent of the problem identified by B&V and identified by this item in the NSRS report is endemic to EN DES drawings for all plants. Therefore it will remain open until EN DES completes a similar review and makes corrections as needed for SQN, BLN, and BFN logic and control drawings versus electrical drawings and termination lists. It is understood that this review for other plants is being performed as a result of the generic review of the B&V findings. NSRS shall be made cognizant of the results of this generic review and upon evaluation will determine if sufficient action has been taken for satisfying this item. A related item is R-84-19-WBN-05 (see below).

SUBJECT:

WATTS BAR NUCLEAR PLANT - AUXILIARY FEEDWATER PUMPS AND DRIVES - CONTRACT 74C30-83094 - INGERSOLL-RAND

NCR'S 3775R AND 3755R-R1 - N3M-94

References: 1. Memorandum from H. B. Rankin to C. A. Chandley dated February 17, 1982 (SWP 820218 112).

- 2. Memorandum from R. W. Cantrell to you dated January 27, 1982 (MEB 820127 019).
- 3. Appendix E of the YCN General Design Criteria for Mechanical Component Quality Groups and Seismic Classification, Revision 2, dated April 17, 1979 (ESS 790419 202).
- 4. Memorandum from J. A. Raulston to L. M. Mills dated April 27, 1982 (NEB 820427 260).

We were informed by your J. F. Hagy that WBN-NCR-3755R-R1 supersedes WBN-KCR-3775R. We have the following comments regarding the equipment listed in NCR-3755-R1 (transmitted by reference 1).

Guidelines for treatment of components that are located in systems with a TVA safety classification of A, B, or C but not designed to ASME Section III requirements are outlined in Appendix E of the Yellow Creek General Design Criteria for Mechanical Component Quality Groups (reference 3). Those guidelines are followed in the information presented below.

The auxiliary feedwater pumping units for Watts Bar Nuclear Plant were procured to the design requirements that were in effect for this equipment at the time of its purchase. Those requirements placed the ASME Section III Class 3 code stamp on the pumps only. For the pumps, that corresponds to TVA Safety Class C. The turbine was designed and banufactured in accordance with applicable sections of ASME III Class 3, including Seismic Category I requirements, but with no code stamp required since the ASME code is not applicable to drive turbines and since no drive turbine manufacturer possesses an N-stamp.

Accessory components for the turbine and motor-driven pumps are manufactured in accordance with the applicable vendor and industry standards with the addition of Seismic Category I requirements. These requirements exceed TVA Safety Class G on the design and manufacture of

J. E. Wilkins

JUN 3 1982
WATTS BAR NUCLEAR PLANT - AUXILIARY FEEDWATER PUMPS AND DRIVES - CONTRACT
78C30-83094 - INGERSOLL-RAND

HCR'S 3775R AND 3755R-R1 - N3M-94

The contractor for this equipment was required to do all work within his scope of supply under a quality assurance program that conforms to the requirements of 10CFR50, Appendix B. Provided the auxiliary feedwater motor and turbine driven pumps and drivers and their accessories are installed in accordance with TVA Safety Class C requirements, the basic intent of reference 2 will be met and the equipment will be suitable for the intended service.

The components listed below are listed with the same item numbers as those used in NCR-3755R-R1, Appendix A-1:

ITEM 1:

Jet compressor for turbine shaft seal leakage - This component is within the turbine package scope of supply. It was purchased to the manufacturer's standards with full seismic requirements and represents the best available commercial grade product at the time of purchase. As noted above, this is similar to a TVA Safety Class G component installed to TVA Safety Class C requirements. This component is fully adequate for the intended service when installed properly by CONST (i.e., according to TVA Safety Class C requirements for installation and support).

ITEM 2:

Pressure control valve (PCV) for jet compressor steam supply - This component is within the turbine package scope of supply. As noted for the jet compressor, the PCV was purchased as the best available commercial grade product, similar to TVA Safety Class G with Seismic Category I requirements for installation in a TVA Safety Class C system in accordance with Class C requirements. This component is fully adequate for the intended service, when installed properly by CONST.

ITEM 3:

Steam traps for the turbine lowpoint drains collection header—The traps serve to keep steam (at or below 5 lb/in²g) passing out of the drain collection header into the turbine room where it would seriously degrade the turbine room environment. These traps were produced directly by TVA to Seismic Class I (L), Safety Class G requirements, and represent the best available commercial grade product of standard manufacture. The traps have

ECN NO. 3 197 ATTACHMENT / SHEET 3 OF 4

J. E. Wilkins

'JUN 3 1982

WATTS BAR NUCLEAR PLANT - AUXILIARY FEEDWATER PUMPS AND DRIVES - CONTRACT 74C30-83094 - INGERSOLL-RAND

NCR'S 3775R AND 3755R-R1 - N3M-94

a design pressure of 150 lb/in²g and are being utilized in a drains system with a design pressure of 5 lb/in²g. This represents a very conservative design margin for the traps. A failure of the traps in the open position would cause x slow degradation of the turbine room environment, resulting in eventual loss of equipment function. A failure of the traps in the closed position would cause water to back up in the various drain lines. This would not prevent the turbine from starting or continuing to run. Since the traps represent the best available equipment for this application, they are acceptable for use as is, provided they are installed in accordance with TVA Safety Class C requirements.

ITEMS 4, 5, 7, AND 8:

Lube oil cooler and oil piping for the turbine and motor driven pumping units - These components are located within the vendor's scope of supply for the pumping units. They were purchased to manufacturer's standards with full Seismic Category I requirements and represent the best available commercial grade products, similar to TVA Safety Class G requirements for installation in accordance with Class C requirements. These components are fully adequate for the intended service when installed properly by CONST.

ITEM 6:

Turbine manifold (lube oil cooling water) piping — This piping is located within the vendor's scope of supply. It was purchased to manufacturer's standards with full Seismic Category I requirements and represents the best available commercial grade products, similar to TVA Safety Class G requirements for installation in accordance with Class C requirements.

These components are fully adequate for the intended service when installed properly.

ITEM 9 AND 10:

Turbine governor valve and trip/throttle valve - These valves were designed and manufactured in accordance with TVA Safety Class C (Seismic Category I) requirements as well as the best manufacturing requirements available. No N-stamp was required. Turbine grade valves such as these are not obtainable with an N-stamp. In addition to the above, it should be noted that valves of this design were subjected to extensive seismic

J. E. Wilkins

'JUN 3 1982

WATTS BAR NUCLEAR PLANT - AUXILIARY FEEDWATER PUMPS AND DRIVES - CONTRACT 74C30-83094 - INGERSOLL-RAND

NCR'S 3775R AND 3755R-R1 - N3M-94

qualification tests by Terry in the type tests for seismic qualification of their turbine. The valves are fully adequate for the intended service. While investigating these valves, their design pressure was questioned by your Jim Hagy. We have confirmed that the turbine valves are rated for the maximum steam inlet pressure of 1226 lb/in²a and 570°F per the turbine data sheet (instruction book) and the equipment design specification.

ITEM 11:

Motor driven pump lube oil console. This equipment is supplied within the scope of supply of the motor driven pumping unit. It was purchased to manufacturer's standards with the addition of Seismic Category I requirements, and represents the best available commercial grade products, similar to TVA Safety Class G, for installation in accordance with Class C requirements. This equipment is fully adequate for the intended service if installed properly by CONST.

In order to fully rest the concerns of this NCR, you need to verify that all of the subject equipment is installed and supported to TVA Safety Class C requirements. We will revise the auxiliary feedwater flow diagram (47W803-3) to indicate the vendor scope of supply and TVA safety class boundaries as they apply to the interfaces between TVA and vendor supplied piping. The FSAR will also be revised accordingly.

LE Bulletin No. 80-20

FAITLETS OF WASTINGHOUSE TYPE W-2 SPRINGLREQUEN TO NEUTRAL CONTROL SWITCHES

By letter dated June 18, 1980, Commonwealth Edison Corporal submitted Licensee Event Report No. LER 50-295/80-24 to the NRC describing a malfunction of a Westinghouse Type W-2 control switch at the Zion Generating Station, Unit 1. The malfunctioning switch is a three position spring return to neutral switch. Although the switch was in its proper neutral position when it malfunctioned, its neutral contacts failed to close properly thereby preventing the automatic start of 1A Service Water Pump.

Folloquent tests conducted on the malfunctioning switch revealed that contact of open was intermittent with the switch in the neutral (or "Anio fitual") antica. Other tests conducted on identical switches from spaces and from that 2 equipment disclosed two additional switches with a tendency for integrational fundance of the content for the content of the content

A review of this matter by Westinghouse led to the issuance of NSD Technical Pulletin No. NSD-TB-80-9 to the utility expers of all Westinghouse operating plants. The recommendations contained in the Westinghouse technical bulletin include: (i) testing the neutral position contacts of the subject W-2 switches for continuity, and (ii) rewiring of the indicating light circuit to permit the early detection of a neutral contact failure as shown in Figure 1.

Regarding in how the indicating light circuit is wired, loss of continuity then the mentral position contact of a W-2 switch could remain undetected until the equipment associated with the switch were called upon to operate. Since such a failure would be equivalent to by-passing the system associated with the switch, consideration should be given to rewiring the switches used in safety-related applications as shown in Figure 1. Such rewiring would provide an acceptable means for detecting contact failure, provided the indicating light is in the control room and readily visible by the operator. If the indicating light is not so located, consideration should be given to annunciating the neutral position contact failures at the control room to alert the operator of the inoperable status of a safety-related system. In addition, consideration should be given to adding redundant contacts to the W-2 switches or to replacing the W-2 switches with others having a more positive contact wiping action.

ACTIONS TO BE TAKEN BY LICENSEES AND HOLDERS OF CONSTRUCTION PERMITS:

Determine whether Westinghouse Type W-2 control switches with spring return to neutral position are used in safety-related applications at your facility. If so, identify the safety-related systems using these

E Filletin No. 80-20 July 31, 1920 Page 2 of 2 switches and the total number of switches counsed. If no such switches are used in your facility, you should indicate that this is the case and ignore the remaining questions. Licensees of operating plants using Type W-2 spring return to neutral control switches in safety-related applications shall perform continuity tests on all such switches. These tests shall be performed with the switch operator in the neutral position and completed within ten (10) days of the date of this bulletin. In addition, this continuity test shall be repeated at least every thirty one (31) days after the initial test and after each manipulation of the switch from its neutral position. These continuity tests may be discontinued subsequent to implementing the longer term corrective measures described below. licensees of operating plants and holders of construction permiss shall describe the lenger term corrective measures planned and the date by which such measures will be implemented by actual installation or by design change, as appropriate. As a minimum, the longer term corrective measures should include rewiring the indicating light as shown in Figure I provided the light is readily visible to the control room operator. If not, failures of the neutral position contacts should be annumicated in the control room. A reject addressing the above matters, including the number of failures detected during the first series of tests and the safety related systems involved, shall be submitted to the director of the appropriate NRC regional office within forty-five (45) days of the date of this bulletin. A copy of the report shall be forwarded to the Director, Division of Reactor Operations Inspection, Office of Inspection and Enforcement, Nuclear Regulatory Commission, Washington, D. C. 20555. Approved by GAO, B180225 (R0072); clearance expires 7/31/80. Approved was given moder a blanket clearance specifically for identified generic problems. Enclesure: Figure 1

"SD IB-73-26, & initial issue of this bulletin, dated 7/19/PH	Shet	01	

FACE - 1 NO INFORMATION

During withly operational testing of the safeguards system at an operating nuclear plant, intermittent W-2 switch operation was discovered in the neutral (auto) position. Inserting tions revealed that the intermittent operation resulted when the switch is returned from the eleven or one o'clock position to the neutral (auto) position. The marker was reported to the Nuclear Regulatory Commission on June 18, 1980. At the same tipe, the initial issue of this Bulletin presented preliminary Westinghouse recommendation.

W Switchgear Division, the manufacturer, has completed a thorough evaluation of the W-2 switch with spring return to neutral (auto), and concluded that no generic failure sechanism exists. This conclusion has been confirmed by independent tests at the W more than Laboratories. The intermittent contact closure reported above was a random occurrence. The RECOMMENDED ACTION previously provided by Westinghouse in the initial issue of this Bulletin is modified as indicated below. These actions meet the minic member of the provided by NRC Bulletin 80-20 of July 31, 1980.

PER THE WED ACTION

- 1. All plants should test all safety-related contacts of the W-2 switches (with special return to neutral position) in the neutral position.
- 2. These tests should be repeated following each subsequent use (rewoval from the neutral position) of the switch, and should be done either at normal operating voltage at the contacts, or at least 24 VDC.

42%

As an alternative to those periodic tests, a personent recolution of any tendencies to intermittent contact continuity is to wice the existing breaker green light indicator in series with the residual position rafety-related bricks (See Sketch). In those instances where no indicating lights switch contacts (See Sketch). In those instances where no indicating lights exist, a lamp drawing a mini um of 40 milliamperes 0.0. About the added.

This current provides for breakdown of contact film contaminants (fritting) to that no safety circuit relaving on contact continuity can fall into a degraded condition. Green light indication will now confirm closure of the safety-related witch contacts, and this indication should be checked after each switch operation.

Memorandum

ATTACHYEST OF E

TENNESSEE VALLEY AUTHORITY
SWP '82 1222 174

- H. J. Green, Director of Nuclear Power, 1750 CST2-C

FROM . M. N. Sprouse, Manager of Engineering Design, W11A9 C-K

DATE : December 22, 1982

SUBJECT. WATTS BAR NUCLEAR PLANT UNITS 1 AND 2 - CONTAINMENT ISOLATION OF

SECONDARY CHEMICAL FEEDLINES

Reference: Your memo to me dated December 2, 1982 (DES 821203 020)

The secondary chemical feedlines will be removed from the four main feedwater lines, the four feedwater bypass lines, and two auxiliary feedwater lines and connected to the steam generator layup recirculation system as recommended in the referenced memo.

This change will be made on ECN 3507 and will meet all the requirements of GDC 57 of 100FR50 Appendix A.

FROM

H. J. Green, Director of Nuclear Brian, 1770 CCT2-C

DATE :

December 2, 1982

SUBJECT:

WATTS BAR NUCLEAR PLANT UNITS 1 AND 2 - CONTAINMENT ISCLALL. SECONDARY CHENICAL FEED LINES

(23:20:22 co8) /2:

Reference: My memorandum to y lives Orotember 21, 1981

The referenced memorandum districts NOT INto recommendations of media GDC 57 of 10 CFR 50 appendix A for into a control coemical feed into a linear transformation was sent, the decision run for made to resolve this problem.

If through the new steam generator reservation modifications.

The new modifications will remove the secondary chemical feed lines to the four main feedwater lines, the four feedwater bypass lines, and two auxiliary feedwater lines. The premical feed lines will true be connected to the steam generator layup recipilation system. This modification has been discussed with John Bayten of the steam of the st

Tennessee Valley Authority

FACILITY:

Watts Bar Nuclear Plant, Units 1 and 2

SUBURUT:

SUMMARY OF SEPTEMBER 17, 1982, MEETING TO DISCUSS THE INDEPENDENT DESIGN VERIFICATION FOR THE WATTS

SAR NUCLEAR PLANT, UNITS 1 AND 2

Representatives of the NRC staff and TVA met on September 17, 1982, in Bethesda, Maryland to discuss the applicant's plans to perform an independent design verification (10V) of the auxiliary feedwater system at the Watts Bar Nuclear Plant. Attendees are listed in Enclosure (1).

Buring the meeting and by letter dated September 9, 1982, TVA committed to have an interpretent contractor (Black and Veatch) perform a design and construction review of the Matts Bar auxiliary feedwater system. TVA intends to take this stallation and compile it with broader, more comprehensive programmatic reviews to confirm their position that Watts Bar is built in accordance with design and construction requirements, and in accordance with the licensing application.

The presentation by TVA consisted of a statement of the scope and objectives of the purisw, the basis for the selection of the auxiliary feedwater (AFW) system, a refinition of the boundaries of the AFWS to be included in the review, the basis for selection of Black and Veatch, and the proposed schedule. A copy of the pre-

Flack and Veaton is expected to begin the review the week of September 20, 1982, and should be finished by the end of December 1982, at which time a copy will be submitted to the NRC. TVA will then submit their evaluation shortly thereafter.

FRETHER CHIMANIATAN MANE P. L. EDECK MINISTER OF

DESCRIPTION OF CONDITION

Various supports on the auxiliary fordunter system have not been modified, recosigned, or initially designed per revised analysis under ECN 2576.

The above condition represents a situation which, if it had not been detected, may he resulted in the imbility of pipe supports to accomplish their safety function. These discrepancies were identified during Black & Veatch review on findings F369, F371, F719, F767, F781, F784, F784, F784, F845, F843, F853, F853, F869, F911, F949, F950, F951, F955, F962, F961, and F963.

DESCRIPTION OF CONDITION

Buy anchors 47A150-3-8 and 47A060-3-10 fail to meet the stiffnass requirements for the force in the z-direction as required by Design Criteria WB-E0-40-31.1 section 7. A Revision 1 of 47A060-3-8 allows 25.3 percond and revision 2 of 47A060-3-10 allows 43.3 percent of the load in the z-direction, applied on one side of the anchor, the to effect through the anchor to the other side. Section 7.1.4 of the design critical limits a load transferred through anchor to 10 percent.

FINDING 136. LOAD THERE IS NO DISCONTINUITY BETWEEN THESE STATEMENTS NOTE WHEN A CIRCUIT EREAKER AND A MOTOR STARTER ARE PROVIDED THE THERMAL OVERLOAD ELEMENTS OF THE STARTER PROTECT THE MOTOR AND CABLE FROM OVERLOADS. THE CIRCUIT BREAKER PROVIDES SHORT CIRCUIT PROTECTION AND SERVES AS A PISCONNECTING MEANS FOR THE MOTOR CIRCUIT, IT IN NOT A REQUIREMENT THAT THE BREAKER RATING MATCH THE CABLE RATING.

#### Instructions:

The organization making or identifying a commitment fills out Commitment Tracking Record (CTR) blocks 2, 3, 4, 6, 9, and 11, and (if known) block 1. Block 1 should name the responsible organization, and in promotheris a person to contact. Commitment Location (block 9) should dite documents containing the commitment, (e.g., SAR sections, NCR number, violation report number), and should include the MEDS number when it's known.

The identifying organization then immediately transmits the CTR to NEB-NLS.

NEB-NLS assigns the Identification Number (block 5), and transmits a copy of the CTR to the responsible organization and other affected organizations.

The responsible organization then (1) controls the commitment (i.e., performs the actions committed); (2) upon completion of the committed action, fills out Resolution (block 12, see note) and returns the completed CTR to the Chief Nuclear Engineer, attention NEB-NLS, by the return form portion of the related Transmittal/Return Memorandum (T/RM).

Note: The person(s) making an entry at Status (block 13) or Resolution (block 12) must initial and date the entry.

The intent of the resolution block (block 12) is to provide evidence of resolution, or else to provide NLS with information required to track the commitment to completion.

The resolution block should either (1) identify the resolution work and its date of completion, or (2) cite the transfer of tracking responsibility into an equivalent tracking system.

In either case, the MEDS numbers of applicable documents should be included. In case (2) the resolution block should include the equivalent tracking system's name and the entry number and date.

#### Instructions:

prganization making or identifying a commitment fills out Commitment Tracking Record (CTR) blocks 2, 4, 5, 9, and 11, and (if known) block 1. Block 1 should name the responsible organization, and in parenthesis a person to contact. Commitment Location (block 9) should cite documents containing the commitment, (e.g., SAR sections, NCR number, violation report number), and should include the MEDS number when it's known.

The identifying organization then immediately transmits the CTR to NEB-NLS.

NEB-NLS assigns the Identification Number (block 5), and transmits a copy of the CTR to the responsible organization and other affected organizations.

The responsible organization then (1) controls the commitment (i.e., performs the actions committed); (2) upon completion of the committed action, fills out Resolution (block 12, see note) and returns the completed CTR to the Chief Nuclear Engineer, attention NEB-NLS, by the return form portion of the related Transmittal/Return Memorandum (T/RM).

Note: The person(s) making an entry at Status (block 13) or Resolution (block 12) must initial and date the entry.

The intent of the resolution block (block 12) is to provide evidence of resolution, or else to provide NLS with information required to track the commitment to completion.

The resolution block should either (1) identify the resolution work and its date of completion, or (2) cite the transfer of tracking responsibility into an equivalent tracking system.

In either case, the MEDS numbers of applicable documents should be included. In case (2) the resolution block should include the equivalent tracking system's name and the entry number and date.

#### Instructions:

The organization making or identifying a commitment fills out Commitment Tracking Record (CTR) blocks 1, 2, 4, 8, 9, and 11. Block 1 should name the responsible organization(s), group(s), and supervisor(s) responsible for each action. Commitment Location (block 9) should cite documents containing the commitment (e.g., SAR sections, NRC question number, NCR number, violation report number), and should include the MEDS accession number when it's known.

The identifying organization than immediately sends the CTR to NEB-NLS.

NEB-NLS assigns the Identification Number (block 5), inputs the Date Filed (block 3), and sends a copy of the CTR to the responsible organization and other affected organizations.

The responsible organization(s) then (1) controls the commitment (i.e., performs the actions committed); (2) upon completion of the committed action, fills out Resolution (block 12, see note) and returns the completed CTR to the Chief Nuclear Engineer, attention NEB-NLS, by the return form portion of the related Transmittel/Return Memorandum (T/RM).

### NOTE

The person(s) making an entry at Status (block 13) or Resolution (block 12) must initial and date the entry.

The intent of the Resolution (black 12) is to provide evidence of resolution, or to provide NLS with information required to track the commitment to completion.

The Resolution block should either (1) identify the resolution work and its date of completion, or (2) cite the transfer of tracking responsibility into an equivelent tracking system and should include the equivelent tracking system's name and the entry number and date.

In either case, the MEDS accession numbers of applicable documents should be included.

**DIVISION OF ENGINEERING DESIGN** 0414 017 **NONCONFORMANCE REPORT** AEPORT NO. WENCEB8206 4 UNIT 1 and 2 PREPARER/ORGANIZATION/DATE Felpel/EN DES - CEB/4-13-82 6 DESCRIPTION OF CONDITION Digitized response spectra data used to qualify safety-related piping systems and possibly other components was prepared incorrectly. A computer program used to remove insignificant and extraneous data did not work properly and improperly altered it. This data included Seismic Excitation and Design Basis Accident information. 82072900033 DATE OF CCCURRENCE EST ( ), ACT. ( ) Unknown [1] ECN REQUIRED YES NO METHOD OF DISCOVERY Design-Data Review 2 SIGNIFICANT CONDITION ADVERSE TO QUALITY UNID CODE (EN DES-EP 8.01) TE SCHEDULE IMPACT DP When the expanded spectra curves were plotted, the peaks of some were not flat and slightly deviated from the horizontal. All of the WBN spectra curve data has been studied and the severest deviation found was less than 8 percent. Ten percent was judged acceptable. There was no need to correct any of the spectra data, and analysis results were not significantly affected. ASSIGNABLE CAUSE: (REQUIRED IF SIGNIFICANT) The analyst, using an interactive computer program, did not use the best judgement in removing digitized data from a spectra curve. Data was extracted so that the 100 point data base in the TPIPE computer program could be applied. LE ACTION REQUIRED TO PREVENT RECURRENCE: (REQUIRED IF SIGNIFICANT) The computer program and analysis technique are no longer being used. \*QA ENGINEER REVIEW AND CONCURRENCE 7.15.82 LABOR EST. # NONCONFORMANCE REPORT COMPLETION VERIFICATION SHEET

NCR NO. WBNEEB8208

SIGNIFICANT YES 🐼 NO C

REPORTABLE YES O

- A. Have any analyses, contracts, memorandums, etc., requiring EN DES work been , generated? Yes () No G If yes, list in (C) below.
- B. Have all ECNs related to the NCR been issued? N/A M Yes  $\Omega$  No  $\Omega$  If yes, list in (C) below.
- . Documents related to the NCR  $\pm$ ECN, analyses, memos, contract No., etc.)

STATUS

COMPLETE

REF OR MEDS ACCESS: NO. WORKING

(see (F) below)

N/A

Is action by organization outside EN DES required? Yes () No () Organization tracking No. (NCR, QCIR, etc.)

E. Has all necessary EN DES information been transmitted to an organization outside EN DES to enable the completion of work required? Yes □ No □ N/A Ø If yes, list in (C) above.

- F. If any document listed in (C) above is indicated in the working status block, item 26 on the NCR cannot be signed.
- G. Is all EN DES action complete? Yes ⋈ No G
- H. Remarks:

Deficiency already included in NCR WBNEEB8104.

The operational modes data used for piling system analyses in the unxiliary building at Watts Bar Nuclear Plant are not documented. The operational mode data for reactor building piping was generated by FDS Nuclear and is sued in Civil-Engineering Branch Report 76-2. In the above citéd cases, a procedure of not exist to assure that revised data was reviewed for effects on previous issued analysis.

## 18 ACTION REQUIRED TO PREVENT RECURRENCE (REQUIRED IF SIGNIFICANT)

Documents concerning operational modes will be maintained as retrievable requires in accordance with TVA's quality Assurance Program. When a reunalists is/require, this will require the operational modes to be reviewed and QA documented. Revision to the operational modes will cause the QA documents to be revised.

The Quality Assurance Criteria 10 CFR50, Appendix B, section XVII, states, "Records shall be identifiable and retrievable." Also, section III states, "Measures shall be established for the identification and control of design interfaces and for coordination among participating design organizations." These measures shall include the establishment of procedures among participating design organizations for the review, approval, release, distribution, and revision of documents involving design interfaces.

The operating conditions used in piping analysis are based upon data requested from organizations outside of the Civil Engineering Branch (CEB). The thermal and seismic design basis "source" data is not in all cases identifiable as being current, valid data and in some cases is not available. No engineering procedure exists to control revisions to this data, i.e., assurance that the analysis is still valid for current operating conditions.

Also, piping analysis has been done by CER personal service contractors who have assumed that the data previously shown on the piping isometrics is still valid. They have signed off on the analysis checklist, item III, Checklist 1 - Geometry Check, 3. Isometrics, i (check that design and operating mode table is shown and correct) without verification that indeed it is still current and valid data.

The report which contains operating mode data for inside containment (CEB report 76-2) has not been maintained to reflect errors that have been observed in the data. As one example the report does not indicate the  $40^{\circ}$  F operating condition for analysis problems 9600200-02-05, -06, -07, -98, -95-91, and -92.

NONCONFORMANCE REPORT REPORT NO. WENCEB8222 R1 ASSIGNABLE CAUSE: (REQUIRED IF SIGMFICANT) WBM piping analysis section was using preliminary data in the original issue of these rigorous analysis problems. These analyses were not documented according to the EM DES-EP 3.03 guidelines. It was the analysis section's intent that when a reanalysis was performed the preliminary data would be finalized and that the analysis calculations (including flange qualification) would be prepared, checked, and sent to MEDS. There was no system in existence that would have required these problems to be reviewed and reanalyzed. YES [ NO E 17) THIS IS A GENERIC CONDITION ACTION REQUIRED TO PREVENT RECURRENCE: (REQUIRED IF SIGNIFICANT) Issue a new section of the rigorous analysis handbook defining flange qualification requirements. Revise checklist to include flange qualification requirements. Conduct EN DES-EP training session instructing EN DES personnel of EN DES-EP 3.03 requirements. \$15/83 "INDEPENDENT REVIEW: Clouses Wanne 8-12-63 MH 21 SCHEDULE EST. ( ), ACT. ( ) DAYS LABOR EST. ( ), ACT. ( ) 24 DATE INITIATED ACTIVITY NO. TASK DESCRIPTION REMARKS: Changed N5-62-9A to be N3-62-9A. Added flange evaluation which are not found in all analysis calculations. This was discovered by Black and Vetch. 208 10/3/14 Veatch Note: This NCR was resubmitted to MEDS to complete block 3 which was inadvertently left blank. ## NONCONFORMANCE REPORT COMPLETION VERIFICATION SHEET

## NCR NO. WANCEBB232

SIGNIFICANT YES D NO M

REPORTABLE
YES D NO M

- A. Have any analyses, contracts, memorandums, etc., requiring EN DES work been generated? Yes O No M If yes, list in (C) below.
- B. Have all ECNs related to the NCR been issued? N/A □ Yes 其 No □ If yes, list in (C) below.

· item 26 on the NCR cannot be signed.

H. Remarks:

G. Is all EN DES action complete? Yes ★ No □

C. Documents related to the NCR (ECN, analyses, memos, contract No., etc.)

|    | Problems N3-3-13A and N3-3-14A are unit 1 and 2 analyses. The unit 1 anchor design for nodes 14C, 295, and 310 does not have calculations to support the anchor load tables. The present anchor load tables are nonconservative. This may not be the only occurrence of this situation, hence further investigation is needed. |                                                  |  |  |  |  |  |  |

| <u> </u>   | PREPARER/ORGANIZATION/DATE N. F. Consumo/CEB/April 18, 1985                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |  |  |  |  |  |
| *          | DESCRIPTION OF CONDITION Unit 1  During the past several months a number of NCRs have been written against various aspects of alternately analyzed piping. This NCR is written to consolidate the appropriate NCRs plus any other nonconforming items found during TVA's program to verify qualification/requalification of WBN piping supported in accordance with the WFN Alternate Analysis Criteria (CEB 76-5). This NCR will be used for consolidation reporting of the above mentioned program. The previously identified NCRs totally included in this NCR are:  WBNSWP8220 - Alternate analysis not properly documented. No WBP engineering procedure to control alternate analysis  WBNSWP8231 - Technical deficiencies in analysis  WBNSWP8231 - Flanged joints not analyzed  WBNSWP8160 - Interface between alternately analyzed piping and deadweight supported piping not correctly analyzed  WBNSWP8306 - Use of CEB 76-5 to analyze aluminum piping. This piping is not within |  |  |  |  |  |  |

| <b>h1a</b> | CORRECTIVE ACTION: The corrective action for these conditions is a 100-percent verification of all WBN piping supported by alternate analysis methods. This verification program involves piping in the scope of responsibility of OEB and WBP. Included in WBP's scope is piping for which WBN CONST located supports in accordance with drawing series 47A053 (for process pipes), 47A051 and 052 (for instrument lines) and 47A054 (for con rol air lines). These drawings provide guidelines for locating and supporting seismic supports.  EN DES-SEP 82-18 Program for Alternate Analysis Fix - Coordinating, Documenting,                                                                                                                                                                                                                                                                                                                                                              |  |  |  |  |  |  |
|            | and Verifying, was written to control the verification program for processing piping within WBP's scope. CEB's verification was performed in accordance with their normal analysis procedures. Instrument and control air line qualification was determined by separate calculations by CEB (CEB 830914 001). In all cases, WBP verifies all supports as adequate or corrects them by revised drawings under ECN 3213 (engineered supports) or variances (typical supports).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |  |  |  |  |  |
