TVA Task Force for Review of Black & Veatch Findings

### BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

3A. Evaluation for Cause

B. Final - continued

WBN unit 2: (la, lb) These causes appear to be applicable to WBN unit 2. (2) These random individual errors are not considered applicable to unit 2.

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - B. Final continued

(1b) NCR GENCEB8302 R1 specifically addresses this cause. The "ANCHOR program has been modified, the output has been modified, and the users manual has been modified to reflect these changes. All skewed anchors which were analyzed using the direction cosine option in question will be reanalyzed. Anchor loads will be compared to the previous design loads, and anchors will be redesigned as needed. This correction is judged adequate. (2) Not applicable. No corrective action is required on unit 2.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SERE?

Date 11/18/8

- 1. Task Force Category 7 for Matts Bar Muclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Muclear Plant unit 1 B&V Findings: Monconforming conditions in construction of previously inspected and accepted pipe supports: 1367, 1704, 1718, 1719, 1726, 1734, 1736, 1737, 1749, 1772, 2773, 2774, 2776, 2819, 2884, 2919, and 2920.
- 3. Evaluation for Cause
  - A. Preliminary

Watts Ber unit 1:

- On ones involving parts removed after final inspection cause unknown.
- On ones involving missing welds and members different than drawing oversight.
- On ones involving clearance and out of tolerance cause unknown. Watts Bar unit 2:
- These causes appear to be applicable to Watts Bar unit 2.
- B. Finel

Concur with A except clearance and out of tolerance problems are usually oversights.

Basp. Or Distant Polon 418/83 Task Force Concurrence 216 5 18183

- 4. Evaluation for Generic Examples
  - A. Preliminary

It is assumed that these examples existed through all systems.

B. Final

Concur with A except that we should not see the pipe weld problems of F718 in unit 2. This problem occurred because of a misinterpretation of a Bergen-Paterson drawing and has been corrected by additional training give to inspectors.

Resp. Or News P. Soun 9/11/83 Task Force Concurrence If 5 V8/83

A. Preliminary

Until the 79-14 program Phase I & Phase II has been completed, the potential exists for the licensing basis not being satisfied.

3. Final

Concur.

Resp. Or Stewar C. Stew 4/19/53 Task Force Concurrence 25/5/53

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

Corrective action is 79-14 program Phase I as defined by WBM-QCF-4.56. Corrective action is adequate.

B. Finel

Contur.

Resp. Or Chrystof Rose 4/18/83 Task Force Concurrence 25/5/83

7A. Identification of Corrective Action for Completed Work

A. Preliminary

The plan in 6A is adequate.

B. Final

Concur.

Resp. Org Apun Choun 4/R/63 Task Force Concurrence 25/5/83

# 8A. Implementation and Inspection of Corrective Action for Completed Work

A. Preliminary

The implementation of NRC Bulletin OIE 79-14 is required prior to fuel loading. This requirement will ensure implementation and inspection of corrective action for completed work.

B. Final

Concur.

Besp. Org. Thomas & Babun 11/18/87 Force Concurrence 1/1/8/83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

It is acceptable for TVA to continue with the program in place and to follow up with the 79-14 program.

B. Final

Concur.

Resp. Org. 1000 1/18/93 Task Force Concurrence 2/ 5 18/83

10A. Identification of Corrective Action for Future Work

A. Preliminary

Same comment as 9AA above.

B. Finel

Concur.

Resp. Org. Decues | Grown 4/18/83 Task Force Concurrence 21/6 5/8/83

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R1 Date 6/3/83

- 1. Task Force Category 9 for Watts Bar Nuclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Finding Failure to adequately control and evaluate embedded plate capacity when multiple attachments were made to the plate by Construction: F506, F710, F711, F712, F713, F724R1, F730R1, F731R1
- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1:

- EN DES procedures did not control or address the addition of attachments to embedded plates by Construction.
- Installation requirements and acceptance criteria on design output documents were not adequate (construction specifications and drawings).
- Watts Bar unit 2: These causes appear to be applicable to Watts Bar unit 2.
- B. Final

Same as Preliminary.

Resp. Org. WSP 7/20/85 Task Force Concurrence 7/20/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

This finding applies to all embedded plates.

B. Final

Same as Preliminary.

A) Resp. Org. WBP 7/20/83 Task Force Concurrence 7 20/83

### 5. Licensing Basis Satisfaction

- A. Preliminary
  Licensing basis is satisfied thus far since the B&V findings and the sampling
  program performed to date has not identified any examples of embedded
  plates where failure would occur. Until the sampling program is
  completed, a potential exists for the licensing basis not being satisfied.
- B. Final Licensing basis is satisfied since neither the B&V findings nor the sampling program identified any plates in the sample that were structurally adequate.

# At Resp. Org. WGP 7/2083 Task Force Concurrence 24/20/83

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    The corrective action for NCR WBH CEB 8203 is a sample of 69 embedded plates
    to evaluate if a failure would occur in a worst case situation. Based on the
    results of the sample, further corrective action may be required. This approach
    is adequate.
  - B. Final

The corrective action for NCR WBNCEB8203 to sample 69 embedded plates was completed. No further corrective action is required.

# A) Resp. Org. WBP 7/2483 Task Force Concurrence 2/2 7 km/83

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 6A appears to be adequate.

B. Final

Identification of corrective action for completed work is not required as all 69 sampled embedded plates were found to be structurally adequate.

A) Resp. Org. W&P 7/20/83 Task Force Concurrence 78-/73

8A. Implementation and Inspection of Corrective Action for Completed Work

A. Preliminary

B. Final

No corrective action for completed work is required as all 69 sampled embedded plates were found to be structurally adequate.

A) Resp. Org. WBP 7/20/63 Task Force Concurrence 2/2 7 kg/83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Construction Specification for Watts Bar Nuclear Plant N3C-928, "Locating Attachments on Embedded Plates," provides requirements to Construction for locating attachments on embedded plates. Hanger drawings should reference this construction specification as required. This plan appears to be adequate.

B. Final

Corrective action as described in A is adequate.

AJ Resp. Org. WBP 7/20/83 Task Force Concurrence

10A. Identification of Corrective Action for Future Work

A. Preliminary

Plan in 9A appears adequate.

B. Final

Plan in 9A is adequate.

Resp. Org. WSP 7/20/83 Task Force Concurrence 2/20/83

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. 82 Date 12/27/83

- 1. Task Force Category 11 for Watta Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Muclear Plant unit 1 B&V Findings: Inadequate documentation of operational modes data used in the analyses of piping systems: F331 and F373.
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1:
    Insufficient control of design information used in piping analysis for operating conditions.
    Watts Bar unit 2:
    This cause appears applicable to Watts Bar unit 2.
  - B. Final

Same as 3.A.

Resp. Org. 72 6 12/27/83 Task Force Concurrence 25/6 15/84

- 4. Evaluation for Generic Examples
  - A. Preliminary

The findings suggest that other deviations may exist. The evaluation for generic examples should include a comparison of the operational modes design information with current design information for all safety-related piping systems.

B. Final
The WBH unit 1 findings suggest that other deviations may exist. A sample of piping
problems will be reviewed as discussed in EH DES-SEP 82-15. This is a sample of all
rigorously analyzed safety-related piping systems and includes portions of those
operating modes contained in CEB report 76-2 and in other sources. The sampling
program will be completed by 1/14/84. Only one problem has failed the sampling
evaluation to date and only the Safety Injection System (SIS) remains to be
completed.

Resp. Org. TE (2/3) Task Force Concurrence W/ 15/84

| 5. | Licensing | Basis | Satisfaction | 200 |
|----|-----------|-------|--------------|-----|

### A. Preliminary

Until the review for unit 1 is completed for all safety-related piping systems, the potential exists for the licensing not being satisfied.

### B. Finel

The licensing basis is not satisfied.

Resp. Org. TE Common PART Task Force Concurrence Wife 115184

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

### A. Preliminary

MCR WBMCRB 8215 and EM DES SEP 82-15 address the findings. SEP 82-15 does not adequately address the generic implications referred to in 4.

### B. Final

ECR WRECES 8215 and EM DES SEP 82-15 address the findings. SEP 82-15 (R1) includes identification and evaluation of worst case affects with the provision that the sampling program can be expanded as needed. The proper corrective action will be determined when the sampling program is completed.

Resp. Org. TE 12/29/89 Task Force Concurrence 2/15/84

# 7A. Identification of Corrective Action for Completed Work

### A. Preliminary

All deviations found in the comparison recommended in 4 must either be resolved by (1) resnalysis of the piping systems or (2) identification and analyses of worst case(s) to justify acceptability.

### B. Final

The plan in 6A.B appears adequate.

Resp. Org. Telemin Rizilis Task Force Concurrence Office /15784

A. Preliminary

#### B. Final

The sample program is still in progress and will be completed by 1/14/84. The single problem that failed the evaluation has been reanalyzed. Only SIS remains to be completed. This entire effort is being tracked through MCR WBMCEB8215.

Resp. Org. ZECTION Task Force Concurrence 2/15184

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Task force is not aware of ongoing corrective action for future work.

B. Final

There is no ongoing corrective action for future work.

Resp. Org. 75 Comin 12 183 Task Force Concurrence 2 1 157 84

10A. Identification of Corrective Action for Future Work

A. Preliminary

224

Programmatic correction is needed to: (1) document the control of operating condition design information and (2) improve adherence to these controls.

B. Final - In the short term to improve documentation and control of operation modes, isometrics will be squadchecked early in the analysis to specifically confirm correct operating modes. The isometric op mode information will be clarified and updated as needed. In addition, the project system designer will inform the piping analysts in writing of any op mode change which has the potential of affecting analysis so that this effect can be reviewed. (This will be further reviewed for long-term corrective action when the WBH sampling program is is completed.) Methodology for handling op modes will be placed in the Rigorous Analysis Handbook.

See Continuation Sheet (page 7).

TVA Task Force for Review of Black & Veatch Findings

BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

10A. Identification of Corrective Action for Future Work

B. Final - Continued

The long-term corrective action has been identified. Documents concerning operational modes will be developed by WBP by 1/30/86. These documents will be maintained as retrievable records in accordance with TVA's quality assurance program. When reanalysis is required, this will require the operational modes to be reviewed and QA documented. Revision to the operational modes will cause the QA documents to be revised.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SERET

Rev. R2 Date 11/9/83

- 1. Task Force Category 12 for Matts Bar Muclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Muclear Plant unit 1 B&V Findings: Failure by EM DES and COMST to properly implement and document the alternate analysis criteria for seismically supported piping: F347
- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1: Failure to have adequate training in EM DES and COMST on the requirements of the alternate analysis criteria. Failure to have an adequate program to ensure that the implementation of the alternate analysis criteria was verified through audits or independent checking process.

Watts Bar unit 2: These causes appear to be applicable to Watts Bar unit 2.

B. Final

The causes shown above in 3A are correct based on the Guidelines for Completing Evaluation;" however, there are some very important and basic causes that are not addressed. These were identified in the findings of the Alternate Analysis Review Team and Independent Review Team.

Resp. Org. R.D. Patt 517183 Task Force Concurrence

- 4. Evaluation for Generic Examples
  - A. Preliminary
    This finding applies to all the Watts Bar unit 2 analysis and pipe support designs for alternately analysed piping performed by EN DES and all of the pipe supports installed by COHST's implementation of the 47A053 drawing series. All deviations will be identified by implementation of EN DES SEP 82-18 "Program For Alternate Analysis Fix Coordinating, Documenting, and Verifying" (SWP 820917012) and the corrective action for NCR WBNCEB 8231.
  - B. Final
    This finding applies to all WBN Unit 2 analyses for alternately analyzed piping performed by EN DES. CONST had not attempted to locate any supports in accordance with the 47A053 drawing series for WBN Unit 2. The exact methods to be used to verify the qualification of piping in WBPs scope has not been determined for WBN Unit 2. Verification of qualification of piping in CEBs scope will also be

performed Sheath 5/7/83 Task Force Concurrence 24 61/183

- 5. Licensing Basis Satisfaction
  - A. Preliminary

Until the review in 4 is completed, the potential exists for the licensing basis on Watts Bar unit 2 not being satisfied.

B. Final

Sense s 54. Based on the deficiencies found on Unit 1, the licensing basis is not satisfied for Unit 2.

Resp. Org. R. S. Prett 5/17/83 Task Force Concurrence 26 61/183

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary - The corrective action for NCR's WBHSWF 8252 and 4164R is a 100% verification per EM DES SEP 82-18 of all Watts Bar unit 2 pipe supports that were alternately analysed by the Sequoyah and Watts Bar Design Projects (SWP). This SEP identifies and corrects all deficiencies in the design and installation of pipe supports that were performed by SWP using the alternate analysis program. Corrective action for NCR WBM CEB 8231 is a verification of the Watts Bar unit 2 problems alternately analyzed by the Civil Engineering Support Branch (CEB) and includes having the supports verified as adequate or corrected by B. Final

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

Plan in 6A appears to be adequate.

B. Final

Plan in 6AB is adequate.

Resp. Org. R.D. Poett 57/7/83 Task Force Concurrence William 6//183

- SA. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final

The corrective action stated in step 6A.B. is not complete. This corrective action will be tracked through completion by NCR WBMSWP8252 R2. This MCR is an open 50.55(e) item for Unit 2 and will require tracking until it is complete.

Resp. Org. R. D. Prett 11/9/83 Task Force Concurrence 26/104/83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary - Corrective Action for MCR's WBM SWP 8252 and 4164R has been identified as follows: SWP EP 43.21 "Alternate Analysis of Piping Systems - Documenting and Verifying" has been issued to control the implementation of the alternate analysis program. The 47A053 series support drawings will be revised to correctly implement the alternate analysis criteria. Training will be provided to EM DES and COMST personnel responsible for implementing the alternate analysis criteria. This appears to be adequate. Corrective action for MCR WBM CEB 8231 has not yet been identified.

B. Final

See attached sheet.

Resp. Org. R.D. Pratt 5/27/83 Task Force Concurrence 26 6 1/ 187

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary

The plan in 9A appears to be adequate.

B. Final
Plan in 9AB is adequate.

Task Force for B&V Findings
Task Force Category 1 - WBN Unit 2

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

## B. Final

The corrective action for NCRs WBNSWP8252 (and other associated EN DES NCRs) will be a 100% verification of all piping alternately analyzed by WBP. Associated support designs will be verified as adequate or corrected by WBP. CONST has not used the 47A053 drawing series for location of supports on WBN Unit 2. Corrective action for CEB analysis will be a verification of the WBN Unit 2 problems alternately analyzed by CEB and includes having the supports verified as adequate or corrected by SWP. These plans are adequate.

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

# B. Final

The action to prevent recurrence for NCR WBNSWP8252 (and other associated EN DES NCRs) is the implementation of SWP-EP 43.21 "Alternate Analysis of Piping Systems - Documenting and Verifying." The 47A053 drawing series has been revised to correctly and more clearly implement the alternate analysis requirements. Training has been provided to SWP and CONST personnel responsible for implementing the alternate analysis requirements. SWP will review a sufficient quantity of CONSTs application of the 47A053 drawing series to confirm proper implementation. These plans should be adequate.

The action to prevent recurrence for CEB has not been identified.

TVA Task Force for Review of Black & Vestch Findings

EVALUATION SHEET

Rev. 21 Date 5/6/83

- 1. Task Force Category 13 for Matts Bar Muclear Plant Unit 2
- Task Force Category Description and Related Matts Bar Nuclear Plant unit 1 16V Findings:

Termination information on the documentation was in error and was not updated to reflect the actual configuration: F142.

- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1: The example B&V finding was an oversight and it is felt it is an isolated case. Watts Bar unit 2: This cause does not appear to be applicable to Watts Bar unit 2.

B. Finel

In addition to the sampling which was done for unit 1, a check was made of the 19 shielded cables which have been terminated on unit 2, system 3. The field configuration was compared to the connection drawings which were compared to the termination slips. There were no errors.

Rasp. Org. Ed Bush 4/18/83 Task Force Concurrence 25/1- 4/2-193

- 4. Evaluation for Generic Examples
  - A. Preliminary
    Watts Bar unit 1: To confirm that the example was isolated, the following sample
    is being evaluated for Watts Bar Unit 1: Compare 40 AFW termination records to
    the termination diagrams. The sample should contain 20 records involving the
    inspector and engineer on B&V finding F-142 and 20 records involving others.
    Watts Bar unit 2: No action will be required for Watts Bar unit 2 unless the
    sample of Watts Bar unit 1 identifies deviations.

    B. Final

This category is not considered to be generic since there were no errors identified on any of the records.

Resp. Org. Ed Bul 4/18/83 Task Force Concurrence Wan 4/20/53

5. Licensing Basis Satisfaction

A. Preliminary
Watto Bar unit 1:
The example identified thus far satisfied the licensing basis. Until sampling is completed, a potential exists for the licensing basis not being satisfied.
Watto Bar unit 2:
There is nothing that suggests the licensing basis has not been satisfied unless the sample in 4 identifies deviations.

B. Final

The licensing basis is satisfied and no further action is required.

Basp. Org. Ed Bushe 4/18/83 Task Force Concurrence 24/2483

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

Task force is not aware of any action.

B. Final

No further action required since no errors were found.

Resp. Org. Ed Bush 4/18/83 Task Force Concurrence 25 4/2483

7A. Identification of Corrective Action for Completed Work

A. Preliminary

B. Final Based on the results of the construction sample as stated in 3.B, no corrective action for completed work is required.

Resp. Org. Ed BiRRE 19/16/83 Task Force Concurrence 246 46483

TVA Task Force for Raview of Black & Veatch Findings

EVALUATION SHEET

Rev. Ri Date 12/22/83

- 1. Task Force Category 14 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Muclear Plant unit 1 B&V Findings: Various supports on the AFW system have not been modified, redesigned, or initially designed per the revised analysis of ECN 2576: #369, #371, #756, #767, #783, #784, #788, #794, #845, #853, #855, #899, F911, F949, #950, F951, F955, F958, F963, F964, F965, and #821.
- 3. Evaluation for Cause
  - A. Preliminary Watts Bar unit 1: An ineffective tracking of work progress under CRB 81-30. SWP's tracking of the status of ECN 2576 provided the inaccurate conclusion that unit 1 work was completed. No formal controls were required for ECMs which required many work items over a relatively long period of time and for which responsibility was transferred between supervisors.

    Watts Bar unit 2: This cause appears to be applicable to Watts Bar unit 2.
  - B. Finel

The above causes may be applicable to unit 2. Unit 2 hangers involved with ECM 2576 have not been completed and no determination for unit 2 can be mad:

Resp. Org. 9 Mark 1/3/84 Task Force Concurrence 115/84

- 4. Evaluation for Generic Examples
  - A. Preliminary

Since all unit 2 hangers were covered by ECN 2576, a complete review of work under ECN 2576 is needed to identify generic examples in rigorous analysis. No action beyond the scope of the ECN 2576 review will be required for Watts Bar unit 2 unless the sample of Watts Bar unit 1 identifies deviations.

B. Final

Since the review of ECN 2576 and ECN 3184 on unit 1 indicated that the problem with unit 1 is not generic, see memo to Files dated 12/14/83 (WBP 831214 001), no further action beyond incorporating the scope of ECN 2576 is required.

| 5. | Ļ   | icensing | Basis | Satisf | tetion |

A. Preliminary

Until the evaluations in 4 are completed, there is no reason to suspect that the licensing basis has not been satisfied.

B. Final

By following procedures in WBP-EP 43.14, the scope of ECM 2576 will be implemented correctly ensuring that the licensing basis is satisified.

Resp. Org. 99 Mon Q / 13184 Task Force Concurrence 24/15/84

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

The task force is not aware of any action.

B. Final

The implementation of ECN 2576 for unit 2 is not complete. However, following WEP-EP 43.14 will ensure the ECN is incorporated correctly and no corrective action will be necessary.

Resp. Org. 990 113184 Task Force Concurrence 115184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

Unless the review in 4 identifies deviations, no corrective action for completed work is required.

B. Final

No corrective action for completed work can be identified until ECN 2576 is completed for unit 2.

A. Preliminary

#### B. Final

All work on unit 2 implemented under ECH 2576 will be tracked by the ECH process per TVA procedures.

Resp. Org. 9970 1/3/84 Task Force Concurrence 1/5/84

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Task force is not aware of any action.

B. Final

See Step 10A.B.

Resp. Org. 90 March 1 3 184 Task Force Concurrence 2/1/84

10A. Identification of Corrective Action for Future Work

A. Preliminary

Criteria need to be established for the identification of need for employment of tracking systems, as well as for implementing them. This criteria should be linked to the establishment of SEPs.

B. Final
All future ECHs on WBP will be written for a single unit only, therefore, eliminating much of the problem that occurred with ECH 2576. To prevent recurrence the review of analysis isometrics and load tables per the scope of the ECH have been upgraded to formal calculation packages requiring appropriate documentation. This upgrading and documentation per the scope of the ECH are requirements that have been incorporated into WBP-EP 43.14.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R1 Date 11/1/83

- 1. Task Force Category 18 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Muclear Plant unit 1 86V Findings:
   A technical note on a piping support drawing (47A050-1T note #3) was found to be invalid for some applications: F761
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1:
    Drawing was not adequately checked and no calculations were
    performed to verify the adequacy of the technical note on
    the pipe support drawing.
    Watts Bar unit 2:
  - These causes appear to be applicable to Watts Bar unit 2.

    B. Final

    The note was issued with the intention that its application is good for self-drilling anchor bolts only (the maximum diameter is 7/8 inch). The designer and checker did not anticipate any other types of bolt sizes larger than 7/8-inch diameter that will be used in pipe supports. Later, different type bolts (and thus larger bolts) were used but the note was not revised.

Basp. Org. R.D. Patt 4/983 Task Force Concurrence Office 1/1/0/13

- 4. Evaluation for Generic Examples
  - A. Preliminary
    - Find all examples where a 1-1/4" or larger wedge bolt was omitted because of note 3 on drawing 47A050-1T.
    - This finding indicates that deviations could exist for technical notes on other typical support drawing series. No action will be required for Watts Bar unit 2 unless the sample of Watts Bar unit 1 identifies deviations.
  - E. Final

    EN DES has identified 10 systems of which there are supports that have 1-1/4"
    diameter wedge bolts. We will review these supports and will continue our
    evaluation to determine if there are other supports (with another type of bolts
    which sizes are larger than 7/8" diameter) that are a potential candidate for the
    note. EN DES will send these drawings to CONST for verification (if the note is
    applicable). EN DES has completed the evaluation of all typical supports and
    general notes and found all to be adequate (WBP 830914 230).

Resp. Org. R. D. Past 10/24/83 Task Force Concurrence 24/ 1/1/483

- 5. Licensing Basis Satisfaction
  - A. Preliminary

Licensing basis impact cannot be determined until all examples of deviations are identified and evaluated.

B. Final

Sens-co-5-As As a result of the review in step 4 of other typical notes and the results of step 8A raview for applications of the deficient note, the licensing basis is met.

Resp. Org. R. D. Pact 4/5/83 Task Force Concurrence 1/10/83

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

No corrective action identified by the task force.

- EN DES has completed its evaluation of all 10 systems and has determined that there are 9 supports with 1-1/4" # wedge bolts or 1" # grouted anchors that could be adverse conditions if the note was applied. EN DES has sent the list of supports to COMST requesting them to verify whether the note has been used. If the note was used, COMST will provide the exact weld length and size. This data will be used to determine the adequacy of the installation. Redesign and reconstruction will be performed as necessary. These plans are adequate.

  Resp. Org. A. Dest. 513/83 Task Force Concurrence
- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

Analyse the adequacy of all generic examples identified under 4 and design and/or reconstruct as necessary.

B. Final
EN DES will evaluate CONST's findings. If the note has been applied, EN DES
will perform the necessary calculations to determine the adequacy of the
substituted welds. If the note has not been used, the support is satisfactory.
Since no other notes of this nature were found to be deficient in step 4, no
further corrective action is required.

A. Preliminary

B. Final

COMST has completed its inspection of all supports identified by EN DES. The results show that none of the supports are installed. (Reference WBN 830523 005)

Resp. Org. R.A. Ratt 76/83 Task Force Concurrence 25/10/83

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

None identified by the task force.

B. Final - Following actions have been taken to alleviate these conditions: (1) EN DES has stopped the use of this note for bolts 1" \$\beta\$ and larger and the drawing note will be revised to limit the applicability of the note; (2) EN DES has issued a construction specification that provides requirements for locating attachments on any embedded plate. This specification (N3C-928) will require a detailed review of connections of this nature.

Resp. Org. R. D. Patt #14/83 Task Force Concurrence 24/10/83

10A. Identification of Corrective Action for Future Work

A. Preliminary

- Revise EN DES EP3.03 to clarify requirements and applicability of calculations for technical notes on design drawings.

- Train all SWP personnel involved in the design and checking of support drawings in the requirements of EN DES EPs 3.03 and 4.25.

B. Final

The plan in 9.A.B is adequate.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 2/21/84

- 1. Task-Force Category 19 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Findings: Equipment cannot be determined to be environmentally qualified to NUREG-0588: F140 and F144.
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1:
    The design control process failed to recognize the need to systematically
    environmentally qualify equipment for postulated accidents.
    Watts Bar unit 2:
    This cause appears to be applicable to Watts Bar unit 2.
  - B. Final
    Watts Bar unit 1:
    The design control process failed to recognize the need to systematically environmentally qualify equipment for postulated accidents.
    Watts Bar unit 2:
    This cause appears to be applicable to Watts Bar unit 2.

Resp. Org. MRR leur 6/3/83 Task Force Concurrence 26/6/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

The very nature of the findings does not lend itself to a sample approach for bounding the problem to the unit 1 AFW system. The EN DES equipment qualification program under NUREG-0588 prescribes an adequate approach to identify generic examples for WBN Unit 2.

B. Final

The very nature of the findings does not lend itself to a sample approach for bounding the problem to the unit 1 AFW system. The EN DES equipment qualification program under NUREG-0588 prescribes an adequate approach to identify generic examples for WBN Unit 2.

Resp. Org. MR8 lur 6/3/83 Task Force Concurrence 26 force 6/6/83

# 5. Licensing Basis Satisfaction

#### A. Preliminary

Lack of environmental qualifications for safety related equipment does not satisfy the licensing basis. Some currently known examples have been identified where the equipment was not qualified.

#### B. Finel

Lack of environmental qualifications for safety related equipment does not satisfy the licensing basis. Some currently known examples have been identified where the equipment was not qualified.

Resp. Org. MR Rolus 6/3/83 Task Force Concurrence CIG 183

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

# A. Preliminary

EN DES has developed and implemented a comprehensive program to determine environmental qualifications of equipment and correct as necessary, including the documenting of all identified deficiencies via the NCR process. This is an acceptable approach.

#### B. Final

EN DES has developed and implemented a comprehensive program to determine environmental qualifications of equipment and correct as necessary, including the documenting of all identified deficiencies via the NCR process. This is an acceptable approach.

Resp. Org. MR Relear 6/3/83 Task Force Concurrence 6/6/53

# 7A. Identification of Corrective Action for Completed Work

# A. Preliminary

The EM DES environmental qualification program includes appropriate corrective action to verify qualifications or require replacement of previously procured and installed equipment.

## B. Final

The EN DES environmental qualification program includes appropriate corrective action to verify qualifications or require replacement of previously procured and installed equipment.

Resp. Org. MRRs/emb/3/83 Task Force Concurrence Heller 6/6/83

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final

Our engineering procedures and our HUNEG 0588 program are adequate to assure proper handling of systems important to safety.

Resp. Org. MR Balow 6/3/83 Task Force Concurrence

24/h 7 24183

- 9A. Identification and Evaluation of Ongoing Corrective Action for Puture Work
  - A. Preliminary

The Task Force is not aware of any action.

B. Final

Presently there is no identified program to ensure implementation of corrective action for future work. However, a nonconformance report GENERA 8204 has been written on this problem. Our Buclear Engineering 2/2/3/Branch is to resolve this NCR.

Resp. Org. MR Bulaurh 3/86 Task Force Concurrence 26/6/

10A. Identification of Corrective Action for Future Work

A. Preliminary

EN DES needs to revise the design control process to provide environmental qualification of equipment.

B. Final - Our NUREG 0588 program presently provides an adequate identification of environmental qualification requirements for future work. In addition, EP 3.01 has been revised to reference environmental drawings. The Watts Bar design criteria has also been revised. EEB has reviewed the attached "Equipment Qualification Program" and has found it adequate for "corrective action" for NCR GENQAB 8204. The need for an interdivisional procedure has been identified in the "Equipment Qualification Program" and this need has been coordinated with OQA.

## EQUIPMENT QUALIFICATION PROGRAM

The need for a comprehensive program to concisely direct and control all activites associated with establishing and maintaining the required level of environmental and functional qualification of safety-related components has become more evident as the work required by IEB79-01B and NUREG-0588 has progressed.

The evaluation work in progress or completed to date has been conducted in compliance with existing procedures that govern specific activities, such as design calculations; however, there has been an absence of an integrated approach to control and insure that the required qualification level of each component is maintained throughout the life of the plant. The proposed programmatic approach to resolve the concerns is depicted by the attached informational flow charts developed to address:

- The completed, current and future activities related to IEB79-01B, NUREG-0558, and 10CFR50.49,
- Any new system that may be added to a plant environmental zone or LOGS.
- The procurement of any safety-related component by EN DES or NUC PR and,
- The installation and maintenance requirements and activities on a component specific basis.

Currently there are 18 Engineering Procedures that govern specific activities associated with equipment qualification. For the proposed program 3 of these will need revision and 7 others need to be developed. One of the 7 will be an interdivisional procedure and one will be an upper tier document addressing the overall program.

The attached listing of existing applicable engineering procedures are indicated on the programmatic flow charts by the number as listed.

EP-4.01 (number 10 on list) requires further consideration for revision to environmental drawings.

EP-5.14 (number 15 on list) requires revision to reflect special handling of vendors qualification test reports.

EP-5.43 (number 18 on list) requires revision to include special handling of qualified items in both vendor shops (waiver approval limitations) and receipt handling at the site.

The detailed review of this proposed program may necessitate some changes to the flow charts and the procedure consideration as now envisioned and these will be incorporated as each need is identified.

The proposed schedule for implementing the plan is as follows:

Finalize plan

Finalize plan

April 13, 1984

Final identification of required revisions
to existing procedures

April 13, 1984

Final identification of new procedures needed

April 13, 1984

Complete draft of new procedures and revisions
to existing procedures

June 15, 1984

Issue new procedures

October 15, 1984

Implementation November 1, 1984

The above schedule was developed unilaterally and is subject to revision as the work progresses and will be dependent to a degree on priority considerations of those involved.

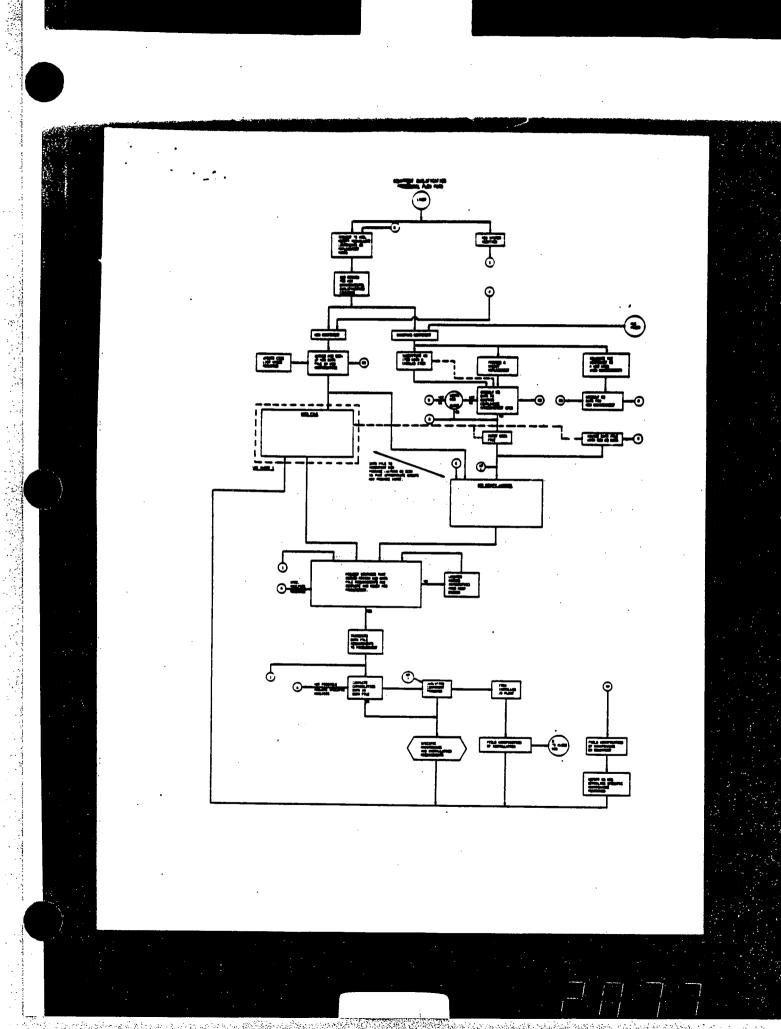

New procedures potentially required are indicated by asterisks in the blocks of the programmatic flow chart as rollows:

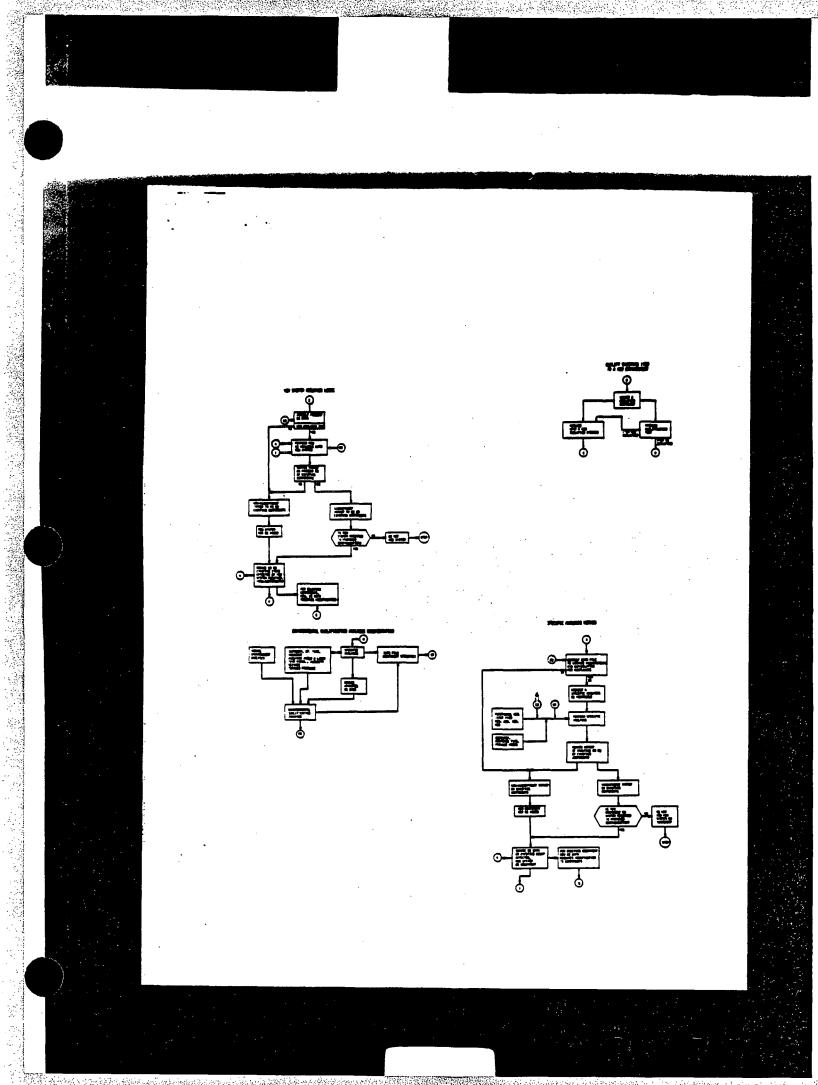

- (\*) To cover input, use and revision of the data base
- (A\*) An interdivisional procedure to cover field varification of installation and maintenance activities for input to the data base and for closure of an HCR (if one is issued)
- (B\*) To cover review for impact on existing system components, etc., resulting from new system addition in an existing environmental sone
- (C\*) To cover qualification testing
- (D\*) To cover "refined" analysis for a specific component in an existing environmental zone
- (E\*) To cover the structure of the data base
- (F\*) An upper tier procedure or document to define the overall program

# ATTACHMENT EXISTING PROCEDURES

- 1. NCR's Reporting and Handling (EP-1.26)
- 2. Control to Documents Affecting Quality (EP-1.28)
- TVA Homorandums Transmitting Quality Information Handling in EN DES (EP-1.50)

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHRET

Rev. R2 Date 11/9/8

- 1. Task Force Category 20 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V
   Findings: No procedure for documenting time delay relay settings that are determined
   by preoperational test and the preoperational test did not identify or require the
   documenting of these settings: F113, F125, F126, F132 and F801.
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1:
    The written design control process did not identify and control the time delay
    relay settings.
    Watts Bar unit 2:
    This cause appears applicable to Watts Bar unit 2.
  - B. Final

Same as above

Resp. Org. MRR. sleer 7/21/83 Task Force Concurrence 2/2/1-9/2483

- 4. Evaluation for Generic Examples
  - A. Preliminary
    Watts Bar unit 1:
    This deviation applies to all systems at that require time delay relay settings.
    Watts Bar unit 2:
    This deviation applies to all systems at that require time delay relay settings.
  - B. Final

Same 1

Resp. Org. MR Below 9/21/83 Task Force Concurrence William 724/83

## 5. Licensing Basis Satisfaction

A. Preliminary

Based on the cause in 3, the licensing basis for these time delay relays was not satisfied.

3. Final

Same as above

Resp. Org. MR Relaw 7/2//83 Task Force Concurrence 2// 9/21/83

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminery

The HCR WHERE 8301 has been written to identify the Black and Beatch finding, however no corrective action has been identified.

Final The preoperational tests are being updated to include the setting and recording of the time delay relay settings. Special Engineering Procedure EN DES-SEP 83-11 is being written to have the time delay settings put on the drawings. Interim memo (KEB 830614 939) was written to document the relay settings.

Resp. Org. MR Behar 7/2//83 Task Force Concurrence 1/6 9 126/83

7A. Identification of Corrective Action for Completed Work

A. Preliminary

The corrective action identified under item 10A should be backfitted for all time delay relays.

B. Finel

Same as above

Resp. Org. MR Below 7 /21/83 Task Force Concurrence 2/ 9/24/83

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final

All time delay settings determined by preoperative test prior to issuance of interim memorandum (EEB 830614 939) were adequately documented. Preop test TVA-22 scoping document has been changed (NEB 821130 276) and SEP 83-11 has been issued to require documentation of all TD settings determined after June 14, 1983. These settings will be reviewed by EN DES after TVA-22 is rerun. This corrective action is not completed but will be tracked by the preop program and EN DES-SEP 83-11 through completion.

Resp. Org. MRBelow | 1/0/83 Task Force Concurrence 2/// 1/10/83

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

The task force is not aware of any action.

B. Final

Special Engineering Procedure EN DES-SEP 83-11 is being written to include the delay relay settings in the preoperation tests.

Resp. Org. 71 RB. Jun 9/2//83 Task Force Concurrence 2/6 9/26/83

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary

EN DES should establish control of time delay relay settings within the design control process.

B. Final

Special Engineering Procedure EN DES-SEP 83-11 will provide adequate control to assure proper documentation of the time delay relay settings.

Resp. Org. MR Bally 9/4/83 Task Force Concurrence 2/6/83

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R1 Date 8/31/83

- 1. Task Force Category 23 for Watts Bar Nuclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 B&V Findings: Auxiliary feedpump turbine trip and throttle valve FCV-1-51 is not included in the active valve list. The design of the valve schematic does not include the required control room bypass and test indication, nor automatic bypass of the "open" torque switch: F128, F133.
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1:
    Lack of control during the determination of safety-related equipment. This process
    did not employ design verification.
    Watts Bar unit 2:
    This cause appears to be applicable to Watts Bar unit 2.
- B. Final
  The failure to include the sumiliary feedwater turbine trip and throttle valve PCV-1-51 on the active valve list was an isolated error. This list was prepared in 1974 using specific selection criteria. Also, the list was reviewed within EN DES and comments were received through the squadchecking process. After resolution of all comments, the list was listed by mean. The subject valve was initially on the list but was removed during the review process due to an error in evaluating the functions of the valve.

  Resp. Org. 17/13 Task Force Concurrence 9/1/153
  - 4. Evaluation for Generic Examples
    - A. Preliminary

The identified cause does not lend itself to a sample approach for bounding the problem to unit 1 AFW. A review of the FSAR active valve list needs to be performed to verify it includes all appropriate components.

3

B. Final

This is not a generic problem associated with the active valve list as shown by the evaluation in item 3. The FSAR active valve list will be reviewed and updated as required during the FSAR review process described in the task force category 4.

Resp. Org. UTCheff 917183 Task Force Concurrence 24 917183

| 5. | Licensing | Resis | Satiafa | etion |
|----|-----------|-------|---------|-------|
|    |           |       |         |       |

A. Preliminary

Based on the cause identified in item 3, the licensing basis does not appear to be satisfied.

B. Final

Since valve FCV-1-52 will be modified, the licensing bases for the plant has been satisfied.

Resp. Org. OTClift 9/7/83 Task Force Concurrence 24/ 9/7/83

6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

The task force is not aware of any action.

B. Final

No additional corrective action is required, but the FSAR will be reviewed and revised as described in item 4 above.

Resp. Org. OT Clyt 717183 Task Force Concurrence 246 717183

7A. Identification of Corrective Action for Completed Work

A. Preliminary

MEB needs to revise the FSAR active valve list. Satisfaction of IE Circular 81-13 needs to be accomplished for any other examples identified under 4.

B. Final

The FSAR active valve list will be reviewed per item 4 above. If additional discrepancies are identified, the required modifications will be identified for corrective action. Valve FCV-1-51 will be modified per the Black & Veatch findings as identified in WBN ECN 3642.

Resp. Org. OTCLH 917/83 Task Force Concurrence 2/10/83

| 84. | Implementation | and Inspection | m of Corrective | Action for | r Completed Work |
|-----|----------------|----------------|-----------------|------------|------------------|

A. Preliminary

#### B. Final

WRM BCN-3642 has been issued to implement corrective action on valve FCV-1-51 which was identified during the Black & Veatch review. Any additional discrepancies identified during the review per item 4 will be documented and handled in a similar manner.

Resp. Org. OTCLIFF 917183 Task Force Concurrence 2/183

## 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

#### A. Preliminary

The task force could not identify any action in place to correct.

## B. Finel

No additional corrective action is required based on the information provided in items 3, 4, and 5.

Resp. Org. Dilly 9/7/83 Task Force Concurrence 26 9/7/83

## 10A. Identification of Corrective Action for Future Work

#### A. Preliminary

The responses to IE Bulletins, Circulars, and Hotices need to be based upon current controlled lists.

#### B. Final

Each IE bulletin, circular, or notice should be evaluated upon receipt to determine the most appropriate method for evaluation. In regard to the active valve list, this list will be reviewed and updated if required per item 4 and will be maintained in the future as the plant design changes; therefore, this specific list will be a current controlled list. IE bulletins, circulars, and notices are handled within EM DES by EP 2.10 and are identified on the TROI system for tracking purposes.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SHEET

Rev. R2 Date 12/16/8:

- 1. Task Force Category 25 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 36V Findings:

Flange evaluations were omitted in some analysis calculations: F322.

- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1: Flange qualifications were not always done by calculations or other documented means. Qualification of these flanges by detailed calculations was not considered necessary.

Watts Bar unit 2: This cause appears to be applicable to Watts Bar unit 2.

B. Final

Flange qualification was deleted from one of the evaluated AFW problems. Checklists indicated those flange qualifications were required. The summary for this specific problem indicated that there were no flanges which required qualification. Analysts were aware of the need to qualify the flanges by detailed calculations. This type of error is largely contributed to individual error, inexperienced personnel, and the fact that some of the initial analyses was conducted prior to the quality control that is presently utilized.

Resp. Org. 75 Commer 12/87 Task Force Concurrence 2/15/84

- 4. Evaluation for Generic Examples
  - A. Preliminary

Flange qualification needs to be reviewed for all rigorous analysis problems for WBN 2.

B. Final

Flange qualification is presently being reviewed for all rigorous analyses for WBN. (Several other deletions have been identified.)
The review has been completed and 35 problems have been identified for which the flanges qualification had not been documented in the analysis.

Resp. Org. 72 Guin 12/5/89 Task Force Concurrence 11/5/84

| 5. Licensing Basis | . Setiefection |
|--------------------|----------------|
|--------------------|----------------|

## A. Preliminary

Until all flanges have been evaluated and qualification determined the potential exists that the licensing basis was not satisfied.

#### B. Final

Licensing basis is satisfied thus far since the B&V finding and the corrections made to date have not identified any examples of flanges where failure could occur or stress allowables could be exceeded. Until all flanges are evaluated, as in 4.8., there exists a slight potential that the licensing basis was not satisfied. (See Continuation Sheet, page 7)

Resp. Org. 72 Communication | 15/84 .

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

#### A. Preliminary

The current planned corrective action for WBNCES 8222 (not yet documented) appears acceptable to identify and correct all examples at WBN 2.

### B. Final

The current planned corrective action for WBNCEB 8222 (a 100-percent review of all WBN problems to assure proper documentation of flange qualification) appears adequate to correct all completed work at WBN.

Resp. Org. 72 Cm.: 12/29/83 Task Force Concurrence 15/84

# 7A. Identification of Corrective Action for Completed Work

#### A. Preliminary

Calculations need to be performed to qualify all the flanges in the rigorous analysis problems.

## B. Final

The plan in 6A appears adequate.

Resp. Org. TE Comme E/27/25 Task Force Concurrence 115/89

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final A 100 percent review of all flanges is in progress. Thirty-five problems were identified for which flange qualifications had not been included in the analysis package. The flanges will be evaluated to determine if they are qualified. Documentation will be upgraded prior to April 1, 1985. This effort is being tracked through HCR WBMCKB 8222. (See Continuation Sheet, page 7)

Resp. Org. 72 Commission | 12/83 Task Force Concurrence 1/5/84

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

Task force is not aware of any action.

B. Final

The latest checklist precisely notifies the analyst of the requirements for the proper flange qualification and documentation. The checklist is presently identified in J. E. McCord's memorandum to CEB Files (CEB 821006 003) and will be incorporated into the WBN rigorous analysis handbook.

Resp. Org. 72 Company Task Force Concurrence 2115184

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary

Specify and implement criteria for demonstration of flange qualification.

B. Final

The action identified in 9.A.B appears to be adequate.

|      |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |
|      |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |

TVA Task Force for Review of Black & Veatch Findings

BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

- 5. Licensing Basis
  - B. Final (continued)

Note from Task Force: Determination of the licensing basis satisfaction is not required for the purpose of task force's review of this category since the responsible organisation has committed to a 100 percent review and corrective action for future work has been implemented. The results of the review will be tracked under nonconformance WBNCEB 8222.

- 8. Implementation and Inspection of Corrective Action for Completed Work
  - B. Final (continued)

Note from Task Force: Determination of the licensing basis satisfaction is not required for the purpose of task force's review of this category since the responsible organization has committed to a 100 percent review and corrective action for future work has been implemented. The results of the review will be tracked under nonconformance WBNCEB 8222.

TVA Task Force for Meview of Black & Veaton Findings

EVALUATION SHEET

Rev. R2 Date 3719/84

- 1. Task Force Category 30 for Watts Bar Nuclear Plant Unit 2
- Task Force Category Description Related Watts Bar Nuclear Plant unit 1 B&V
  Findings: Failure to satisfy design criteria for 1) monitoring operability and 2)
  providing adequate electrical protective devices for the motor driven auxiliary feed
  water pump lube oil pump: 1) F100 and 2) F130
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1: 1) and 2) SWP failed to adequately design and/or review the
    design of safety system support equipment which operates full time with respect to
    criteria for status monitoring and electrical protection. The cause is not
    clearly understood but was due to inadequate implementation of existing design
    control requirements.
- 4. Evaluation for Generic Examples
  - A. Preliminary
    - and 2) A review needs to be performed of all WBN unit 2 designs involving full.
       time operating equipment which supports the operability of safety related equipment to identify generic examples where status monitoring and/or electrical protection were not satisfied.
  - B. Final 1) A generic review will be conducted after a procedure is developed specifying how NUC PR and EN DES will exchange information regarding maintenance schedules for plant equipment.
    2) Review of all full-time operating equipment supporting safety-related equipment determined only one other similar type device was inadequately protected: Aux FW pump valve electro-hydraulic actuators (1-MTR-3-122-A, 1-MTR-3-132-B) (Ref: Memo from C. C. Fisher to WBP Files dated June 10, 1983 (WBP 830610 032).

Resp. Org. 9.0. Collin 3/19/24 Task Force Concurrence 3/19/84

# 5. Licensing Basis Satistaction

- - 1) The licensing basis was not satisfied since the ND AFP lube oil pump was expected to be deliberately made inoperable more frequently than annually, hence requiring status monitoring.
  - 2) The licensing basis was not satisfied since neither the MD AFP lube oil pump motor nor its cable were adequately protected as specified in FSAR 8.3.1.1.
- - 1) Licensing basis is satisfied for the MD AFP lube oil pump since it has been added to status monitoring on EUN 3827.
  - 2) The licensing basis was not satisfied since the MD AFP lube oil pump motor and its cable were not adequately protected as specified in FSAR 8.3.1.1.

Resp. Org. 9. B. Colling 3/19/84 Task Force Concurrence

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary
    - 1) The task force is not aware of any action.
    - 2) ECN 3636 identifies F-136 and commits to addition of appropriate electrical protection.
  - B. Final
    - 1) ECN 3827 added MD AFW lube oil pump to status monitoring (Ref: EM DES response to finding F-100).
    - 2) ECN 3636 referenced F-136. It also included generic examples specified in 4A.

Resp. Org. 9.0. College 3/19/84 Task Force Concurrence 3 <u>119184</u>

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary
    - 1) and 2) Addition of appropriate electrical protection and/or status monitoring is needed for all deviations generically identified under 4.
  - B. Final
    - 1) Generic examples, if found, will be corrected after review in item 4 is complete.
    - 2) Generic deviations included in ECN 3636.

Resp. Org. G. C. College 3 //9/84 Task Force Concurrence

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Finel
    - (1) CTR R294 will track the completion of past work by reviewing the maintenance schedule to determine if the requirements of status monitoring in RG 1.47 are met. Any deficiencies will be corrected.
    - (2) ECN 3636 has been completed (SWP 830303 618).

Resp. Org. 95. Colles 8/9/84 Task Force Concurrence 2/1 3/7/84

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary
    - 1) and 2) The task force is not aware of any action.
  - B. Final
    - 1) Procedure will become part of the Office of Power and Engineering issued and controlled documents and will be reviewed periodically per Engineering Procedures Training and Utilization Program (Ref: memorandum from M. N. Sprouse to Those listed dated February 26, 1982 (NEB 820226 255).
  - 2) Engineering Procedures Training and Utilization Program initiated by M. M. Sprouse to Those listed dated February 26, 1982 (NEB 820226 255).

    Resp. Org. 9. 1. (1984) 3 /19/84 Task Force Concurrence 3 /19/84
- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary
    - 1) and 2) More definitive causes must be established in 3 in order to identify appropriate actions to improve future work.
  - B. Final
    - 1) Procedures will become part of EN DES issued and controlled documents and will be reviewed periodically per Engineering Procedures Training and Utilization Program (Ref: memorandum from M. N. Sprouse to Those listed dated February 26, 1982 (NRB 820226 255).
    - 2) Engineering Procedures Training and Utilization Program initiated by M. M. Sprouse to Those listed dated February 26, 1982 (NEB 820226 255).

TVA Task Force for Review of Black & Veetch Findings

EVALUATION SHEET

Nov. El Date 4/27/83

- 1. Task Force Category 31 for Matts Bar Buclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Ber Nuclear Plant unit 1 36V Findings: Editorial discrepancies in licensing documents: F119 and F321.
- 3. Evaluation for Cause
  - A. Preliminary
    Watts Bar unit 1:
    The preparation process and checking through OEDC and Power Regulatory Staff did not identify and correct all editorial discrepancies.
    Watts Bar unit 2:
    This cause appears to be applicable to Watts Bar unit 2.
  - B. Finel

Both findings describe FSAR errors that are editorial in nature.

Resp. Org. DT Clift 4127/83 Task Force Concurrence Walter 427/83

- 4. Evaluation for Generic Examples
  - A. Preliminary

The low editorial error rate found in unit 1 AFW commitments combined with their lack of plausible negative impact does not warrant an evaluation for generic examples at this time.

B. Finel

No further evaluation is required.

|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.      | Proliminary                                                                                                                                                                                                                                                                                                                                                                     |
|         | The editorial nature of the FSAR errors does not jeoperdise the licensing basi defined in the FSAR. Therefore, no further action required.                                                                                                                                                                                                                                      |
| 3.      | Final The findings do not represent conditions that compromise the licensing basis for the plant. Therefore, no further action on this category of findings is required. However, it should be noted that corrective action taken/planned as a result of the category 4 findings will serve to correct FSAR errors of this assessment is applicable to both units at Watts Bar. |

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SERRE

Lev. Date 12/19/83

519183

- 1. Task Force Category 32 for Watta Bar Huclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Buclear Plant unit 1 36V Findings: Incompatible hanger drawings and piping isometric drawings: 7753, 7858, 7865, 7866, 1932, 1939, 1942, 1976, 1983.
- 3. Evaluation for Cause
  - A. Preliminary

Watts Bar unit 1:

- Inadequate drawing checking and design verification prior to issuance.
- Inadequate recognition of need to revise companion drawings during design change Drocess.

Watts Bar unit 2:

- These causes appear to be applicable to Watts Bar unit 2.
- B. Finel

The following causes are identified for completed unit 2 work:

- Inadequate coordination between branches per EP 4.04 as to checking and design verification prior to the issuance of drawings.
- Drawings were not checked thoroughly to insure correctness and legibility.
   Design and construction were not complete at time of Black and Veatch review.

5/5/83 Task Force Concurrence 24

- 4. Evaluation for Generic Examples
  - A. Preliminary

Problem is generic to hanger drawings and piping isometrics.

B. Finel

Problem is generic to hanger drawings and piping isometrics that have been completed to date.

|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A.</b> | Preliminary This situation provides as inconvenience to COMST; however, the controls required successfully correlate the hanger location on the physical drawing with the location on the analysis isometric to satisfy the total tolerance prescribed precludes improper hanger installation as a result of these momenclature discrepancies.                                                                                                                            |
| 3.        | Final This situation is only an inconvenience to COMST. Final inspection, WBS 79- place per ECH 3100 will identify visual discrepancies on completed work and will be corrected. Hangers are installed per hanger detail drawings and insp proper location per analysis isometrics. This method prevents improper hang installation even though nomenclature discrepancies exist. Inspection will stringent in future on this as a result of the Black and Vestch review. |

- 7B. Identification of Corrective Action for Completed Work
  - A. Preliminary

The plan in 68 appears adequate.

3. Final

The plan in 68.8 is adequate.

Resp. Org. Of Most 5/5/83 Task Force Concurrence 2/6-5/7/83

- 8B. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final
    The preliminary walkdown inspection, CES 81-30 will be completed and tracked by ECH 2576. The final walkdown inspection WBM 79-14 will be implemented after CES 81-30 and ECH 2576 are complete and will be tracked by ECR and ECH to be written when the program is implemented.

Resp. Org. 99 Mark 12 12 11 93 Task Force Concurrence William 12 12 183

- 9B. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

The task force could not identify any in place or proposed corrective action.

B. Final

Procedures exist within EN DES to prevent these discrepancies from occurring on any future work.

TVA Task Force for Noview of Black & Vestch Findings

EVALUATION SERET

Nov. 21 Date 4/6/83

- 1. Task Force Category 33 for Matts Ber Muclear Plant Unit 2
- Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 36V Findings:

Inadequate cable tagging: 7807 and 7809

- 3. Evaluation for Cause
  - A. Preliminary
    Watts Ber unit 1: Finding F807 was caused by oversight. The information on the
    tag had the correct cable number and that it was safety-related but the color of
    the tag was incorrect. Finding F809 was caused by repetitious rework which
    resulted in the legibility of the tag to be in question.
    Watts Ber unit 2: This cause does not appear to be applicable to Watts Ber
    unit 2.
  - B. Final

The mineteen cables which were involved in category 13 for unit 2 were checked for tagging. No errors were identified.

Rasp. Org. Ed Buch 4 /18/83 Task Force Concurrence 24/ 4//8/53

- 4. Evaluation for Generic Examples
  - A. Preliminary
    Watta Bar unit 1:
    This is not considered to be generic due to the low frequency and the findings do not present a safety problem.
    Watta Bar unit 2:
    This does not apply to Watta Bar unit 2.
  - B. Pinel

Not generic since no errors were identifed.

TVA Dak Perce for Noview of Black & Vesteb Findings

EVALUATION SHRET

Dete 3/44/83 4/18/83

- 1. Task Porce Category 34 for Matte Bar Muclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Nuclear Plant unit 1 367 Findings: "Out of function" feature of a drawing was not in agreement with the latest design drawing showing the detailed design of the "out of function" feature: 7857, 7910, 7982, 7984, 7985, 7986, 7987, 7988, 7989, 7992, 7993
- 3. Evaluation for Cause
  - A. Preliminary Watts Ber unit 1: "Out of function" features have no effect on the technical adequacy of drawings and are for general location value. Checking of drawings and subsequent revisions of drawings do not include ensuring that all "out of function" features on drawings are in agreement with the latest detailed design for the feature. Watts Bar unit 2: These causes appear to be applicable to Watts Bar unit 2.
  - B. Final

Same as preliminary.

4/24/83 Task Force Concurrence Resp. Org. A. STAALEN

- 4. Evaluation for Generic Examples
  - A. Preliminary

This example is typical of other discrepancies in "out of function" features. No sampling program for Watts Bar unit 2 is necessary because these discrepancies have no potential to affect licensing coumitments.

B. Final

Same as preliminary.

d Toronian is some TVA Task Force for Neview of Black & Vestch Findings

EVALUATION SHEET

- 1. Task Force Category 35 for Watts Bar Nuclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Muclear Plant Unit 1 BLV Findings:

Instantaneous trip setting for motor-operated valve breakers is not in accordance with EM DES criteria and vendor recommendations: F137

- 3. Evaluation for Cause
  - A. Preliminary Watte Bar Unit 1 - EN DES critiera and recommendations provided by motor vendors for instantaneous trip setting were not applied correctly for MOV motors rated less than 1/2 hp. - Iradequate checking of the drawing to ensure compliance with established criteria.
  - Watts Bar Unit 2 This applies to Watts Bar Muclear Plant unit 2.
  - B. Final

See Continuation Sheet (page 7).

Resp. Org. Lancamon (1 | 1 | 83 Task Force Concurrence

- 4. Evaluation for Generic Examples
  - A. Preliminary

This finding suggests that this deviation could be applicable to all MOVs with motors rated less than 1/2 hp. Corrective action in step 7A will identify all examples.

B. Finel

Finding is generic to all loads fed from motor control center molded case instantaneous only circuit breakers. Corrective action in step 7A identified all examples.

Resp. Org. Company 1/ 19/83 Task Porce Concurrence 1/1/1/83

### 5. Licensing Basis Satisfaction

A. Preliminary

- (1) The licensing basis is not satisfied because TVA is committed to meeting the requirements of the Mational Electrical Code and has failed to fulfill this commitment for instantaneous trip settings for motors in MOVs rated less than 1/2 hm.
- (2) The safety significance will have to be determined for each deviation identified.

B. Finel

- (1) Same as above.
- (2) No significance to plant safety. Although instantaneous settings were higher than recommended settings, all loads required to perform a safty function would perform acceptably.

Resp. Org. Gaussian N 14/63 Task Force Concurrence 21/1-1/83

# 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work

A. Preliminary

The task force is not sware of any corrective action.

B. Final

No ongoing corrective action for completed work was being done at the time of the finding.

Resp. Org. Gaussing 11 14 1 83 Task Force Concurrence 2 11/2/83

## 7A. Identification of Corrective Action for Completed Work

A. Preliminary

Review all safety-related MOVs with motors rated less than 1/2 hp and evaluate their circuit breakers instantaneous trip settings for compliance with the EN DES critiera established in DS-E9.2.1 and the vendor's recommended setting. Revise any settings as required to be in accordance with EN DES criteria and vendor's recommendation.

B. Final
Review all safety-related MOVs with motors rated less than 1/2 hp was performed and documented by memo from C. C. Fisher to WBP Files dated June 15, 1983 (WBP 830615 022). The necessary corrections were made on ECNs 3904 (UI) and 3905 (U2) which were closed on September 8, 1983 (closure sheet 104 - WPB 830908 068). (See Continuation Sheet - page 7).

Resp. Org. Comesopo N 14/83 Task Force Concurrence 11/1/83

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final

ECRs 3904 (U1) and 3905 (U2) completed and closed on September 8, 1983 - closure sheet 104 (WEP 830908 068).

ECH 4251 - work in progress and will be tracked on ECH through completion.

Resp. Org. Grand of 19 103 Task Force Concurrence 2117/83

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary

The task force is not aware of any corrective action.

B. Finel
All designers and checkers have been been told to strictly adhere to all
criteria used to prepare EN DES drawings, as part of the engineering
procedures training and utilisation program initiated by M. N. Sprouse
Ref: Hemorandum from M. N. Sprouse to Those listed dated February 26, 1982
(MES 820226 255).

Resp. Org. (1907) 1/4/83 Task Force Concurrence

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary

Provide training to personnel responsible for designing and checking drawings that contain trip settings for MOVs.

B. Final

Mone necessary due to ongoing corrective action specified in 9A.

Resp. Org. Unicopy 11 14183 Task Force Concurrence 21/2/83

TVA Task Force for Review of Black & Veatch Findings

#### BLACK & VEATCE EVALUATION SHEET (Continuation Sheet)

#### 3.B. Final

Division of Engineering Design Electrical Standard 30A301 (issued 10-2-51) which was in effect at the time of Watts Bar initial circuit design, provided no criteria for molded case circuit breaker instantaneous trip settings. Instead, manufacturer's criteria provided as part of the motor control center contract, was used to determine correct settings. On September 28, 1976, TVA Standard 30A301 was superseded by EM DES Standard DB-E9.2.1. This standard specified (for the first time) that Mational Electrical Code criteria would be used to set instantaneous only breakers. EM DES failed to fully retrofit this new criteria into its original design for the following reasons:

- (1) An assumption on the part of the designer and checker attempting to implement this requirement, resulted in setting the majority of breakers one setting too high. This occurred because the designer calculated 13 times the full load current (FLI) and then set the breaker to the next higher setting to prevent nuisance tripping. In actuality, he should have set it on setting lower for strict compliance with the NEC.
- (2) In some cases the existing breaker would have had to be replaced to adhere strictly to the NEC criteria. The designer judged that the lowest setting for the existing breaker, while slightly higher than 13 time FLI, was still adequate. In actuality the breakers should have been replaced for strict compliance with the NEC.

### 7A. B. Final (continued from page 2)

Additionally, all remaining safety-related loads fed from motor control center instantaneous only breakers were reviewed per request from EEB dated September 8, 1983 (EEB 830908 926). This review determined that 13 breakers required replacement and 385 breakers required resetting. ECN 4251 has been issued to make these corrections. The ECN package includes documentation of the study.

TVA Task Force for Review of Black & Veatch Findings

EVALUATION SELECT

Nov. 81 Date 11/9/83

- 1. Task Force Category 36 for Watts Bar Nuclear Plant Unit 2
- 2. Task Force Category Description and Related Watts Bar Muclear Plant Unit 1 34V Findings: The cable tray fill criteria (FSAR section 8.3.1.4.5) is not assured of being met because of the less than conservative nominal values used for cable cross sectional areas in the cable routing program F135
- 3. Evaluation for Cause
  - A. Preliminary
    Personnel involved did not identify that this potential deviation from the FSAR
    commitment would result in a condition adverse to quality. After the evaluation
    in Step 5, the cause(s) will have to be determined if the licensing basis is not
    satisfied.
  - B. Final

Refer to 5 A. B., Licensing Basis Satisfaction

Resp. Org. R.L. Swellows 11/10/93 Task Force Concurrence

- 4. Evaluation for Generic Examples
  - A. Preliminary After completion of Step 5, this will be evaluated for generic examples if the licensing basis is not satisfied.
  - B. Final

N/A

Resp. Org. A.L. Swellane III 10/ 93 Task Porce Concurrence

- A. Preliminary
  Licensing basis satisfaction needs to be investigated in the following areas: 1)
  FSAR requirements satisfied; 2) Effect on ampacity if overfill occurs in a power
  tray; 3) The tray dynamic response and tray support loading if tray overfill
  occurs; 4) Fire protection requirements if originally specified for 60% fill.
- B. Final

TVA Task Force for Review of Black & Veatch Findings

#### SLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

- 5. Licensing Basis Satisfaction
  - B. Final
  - 1. The FSAR requirements have been satisfied as discussed below.
  - 2. This Black & Veatch finding erroneously identified cables as being installed in power (V4 level) cable trays; whereas, the cables identified are installed in control (V3 level) cable trays. The criteria for tray fill of V4 power trays is 30 percent of the available cross-sectional area of the tray; the tray fill for V3 control and instrumentation (V2 and V1) trays is 60 percent. The cable fill is based on summing the areas of the various cables that are randomly laid in the trays. Any minute variance in nominal cable diameter of power cables has no significance on cable area or tray fill; thus, there is no effect on ampacities of cables installed in power trays.

TVA procures insulated cables at different times for a project. The same type of cable, by identification mark number, meets the same specification even though different vendors may supply the cable. The cables are manufactured following the guidelines of the Insulated Cable Engineers Association (ICEA) standards which allow tolerances for insulation and jacket thickness. Therefore, cable diameters from the same or different vendors generally do vary slightly. Although TVA did not specify a maximum outside diameter (OD) for the WBM cables, vendors normally stay within ICEA tolerences of approximately 5 percent, obviously for competetive reasons. Variations in cable OD of multiconductor cables are usually attributed to light-weight filler material.

For example, a 2-conductor No. 14 AWG control cable may be manufactured by the flat (two insulated conductors run parallel to each other with an overall jacket—oval shape) method, or by the round (two insulated conductors that are twisted with filler material under the overall jacket—round shape) method. This type cable is used for control functions that convey information or intermittantly operate devices controlling power switching or conversion equipment. Thus, conductor heating is insignificant for control cables, as well as instrumentation cables, and raceway fill does not affect cable ampacity.

For WBN, the majority (approximately 85 to 90 percent) of the two-conductor control cable furnished was constructed by the flat method. This oval-shaped 2-conductor cable was equated to have a nominal 0D of .309 inches used for tray fill calculations. Some of the round-shaped two conductor cable has an 0D of .404 inches. These two cables have the greatest disparity in 0D and thus cross-sectional area as noted in the

TVA Task Force for Review of Black & Veatch Findings

BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

### 5. Licensing Basis Satisfaction (continued)

#### B. Final

Black & Veatch finding; again this difference is due primarily to the added light-weight filler material of the round cable. However, the average cable routed in control level trays is 5-conductor. Therefore, for a given control level tray, multi-conductor control cables may vary from a 2-conductor through a 19-conductor configuration.

Although TVA used nominal OD in calculating the cross-sectional area of the cable for tray loading purposes, the nominal OD may vary only a few thousandths of an inch compared to a respective cable vendor data. Even if these variances do result in a cross-sectional loading slightly above 60 percent fill for control and instrumentation cable trays, there is no effect on cable ampacity. For power cables, the copper cross-sectional area is not increased by any increase of cross-sectional area of the finished cable assembly, due to increased insulation/jacket thicknesses. The adequacy of the current carrying capability and ampacity derating of power cables, when routed in trays, is considered by the cable designer when he sizes the cable for its application, including short circuit handling capability. For example, power cables for motor circuits are conservatively sized for 125 percent of motor ratings. Thus, adequate cable ampacity exists for power cables in trays which have a 30-percent fill by cross-sectional area.

- 3. Any minute differences in nominal cable ODs versus actual ODs have no impact on either the cable tray support system or the fire hazards analysis. The dead weight loading of cables, cable trays and fittings, is applicable cable costing used a conservative composite weight of 45 lbs/ft of tray (for 18-inch width) in the dreelopment of criteria for the cable tray support system. The composite weight and combustible loading are based on trays being 100 percent fill.
- 4. For the type of cables used, the insulations and jackets have a range of combustibles from 6000 to 14,000 BTUs/lb. The fire hazards analysis utilized a conservative 14,000 BTUs/lb fire loading of combustible cable material where cable trays occur. Moreover, the applied cable coating reduces the ignitibility and combustibility of the insulation/jacket material. In addition, were more than 120,000 BTUs/sq ft of installed combustibles exist in safety-related areas, a fixed suppression system is installed.

From this evaluation, minor variations in actual cable tray fill have no effect on cable ampacities, on the support system, or on the fire protection system. Therefore, TVA's position is that the installation is satisfactory and complies with FSAR requirements.

TVA Task Force for Raview of Black & Westch Findings

EVALUATION SHEET

1. Task Force Category 37 for Watts Bar Nuclear Plant - Unit 2

2. Task Force Category Description and Related Watts Bar Nuclear Plant Unit 1 86V Findings: Valve wiring circuits are designed such that the red and green indicating lights on the unit control board will light dimly upon malfunction of the P-auto contact of the Westinghouse W-2 control switch on the unit control board: F112

### 3. Evaluation for Cause

A. Preliminary

Watts Bar Unit 1 - Inadequate recognition of need to design circuits that do not rely on a situation where the operator must make a judgement of lamp brightness to determine equipment condition.

-Inadequate design checking/verification during circuit design process to allow "sneak circuit" condition to exist. Watts Bar unit 2 - These causes appears to be applicable to Watts Bar unit 2.

B. Final

The need to design circuits that do not rely on operator judgment of lamp brightness to determine equipment status was recognized and design proceeded accordingly. However, the identified failure was the result of a single random design error in conjunction with inadequate design checking/verification during

- 8A. Implementation and Inspection of Corrective Action for Completed Work
  - A. Preliminary
  - B. Final

Implementation and inspection of corrective action for completed work will be will be accomplished prior to unit 2 fuel load by ECN 4592.

Resp. Org. 90 R Rehum 2/29/84 Task Force Concurrence 2/27/84

- 9A. Identification and Evaluation of Ongoing Corrective Action for Future Work
  - A. Preliminary
    Task force knows of no ongoing programmatic corrective action.
  - B. Final

Concur.

Resp. Org. MABelo Z /29/8 y Task Force Concurrence Z

- 10A. Identification of Corrective Action for Future Work
  - A. Preliminary
    Must be determined by evaluation of cause(s).
  - B. Final

The identified failure was the result of a single random design error. All designers are aware of the potential for this type of error, particularly during design of circuit modifications, and strive to avoid these errors. No corrective action for future work will be required.

EVALUATION SHEET

Rev. <u>\$2</u> Date 12/19/83

1. Task Force Category 18 for Watts Bar Suclear Plant - Unit 2

2. Task Force Category Description and Related Watts Bar Huclear Plant unit 1 B&V Findings: Evaluation to determine if design of thermal overload bypass circuits met requirements of commitments to RG 1.106 and IEEE 279-1971: F108 and F122.

## 3. Evaluation for Cause

A. Preliminary

Watts Bar Unit 1: After the evaluation in Step 5, the cause(s) will have to be determined if the licensing basis is not satisfied.
Watts Bar Unit 2: The same evaluation must be accomplished for Watts Bar unit 2.

B. Final

Licensing basis is satisfied. See Item 5 for justification.

Resp. Org. On Silver 185 Task Force Concurrence 2/13/84

# 4. Evaluation for Generic Examples

A. Preliminary

After completion of Step 5, this will be evaluated for generic examples if the licensing basis is not satisfied.

B. Final

The condition is generic for Watts Bar Units 1 and 2 motor-operated valves.

Resp. Org. DI /21 /21 /23 Task Force Concurrence 2 1 1 184

- A. Preliminary
  WBH MOV thermal overload bypase design needs to be investigated for: (1)
  Capability for "... testing and calibrating channels, and the device used to
  drive the final system output signal from the various channel signals,..." as
  required by IEEE 279-1971 (Section 4.10), and (2) Reasons for the BLM thermal
  overload bypass circuit design philosophy differing from that used at BFM, SQM,
  and WBH.
- B. Final

See continuation sheet for justification.

Resp. Org. M. Sale 12/21/83 Task Force Concurrence Aller 1/3/84

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

Task force is not aware of any corrective action.

B. Final

No corrective action required.

Resp. Org. DM. College /24 /83 Task Force Concurrence 113 184

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

To be determined after evaluation in Step 5 is complete.

B. Final
No corrective action has been identified. However, WB-DCR-482 will be implemented for operating convenience. This modification will add one relay to each of the eight motor control centers and change wiring so that an indicator light will come on when all overload bypass relays for a given motor control center operate. The modified test circuit will also fully satisfy the requirements of RG.1.106, G.1.b, and IEEE 279, 4.10
Resp. Org. Task Force Concurrence

B. Final

N/A

Resp. Org. In Col. 12/21/83 Task Force Concurrence 21/6 / 13/84

9A. Identification and Evaluation of Ongoing Corrective Action for Future Work

A. Preliminary

Task force knows of no ongoing programmatic corrective action.

B. Final

The modified test circuit will be included with any motor operated valve overload relay bypass circuits added at Watts Bar Nuclear Plant in the future.

Resp. Org. M. Jaky 12/51/83 Task Force Concurrence

10A. Identification of Corrective Action for Future Work

A. Preliminary

To be determined if evaluation in Step 5 shows the licensing basis is not satisfied.

#### SLACE & VEATCE EVALUATION SHEET (Continuation Sheet)

- 5. Licensing Basis Satisfaction
  - B. Final
- (1) MG 1.106 (Thermal Overload Protection for Electric Motors on Motor-Operated Valves), identifies the criterion for thermal overload protection devices that are integral with the motor starter for electric motors on motor-operated valves. IC 1.106 also describes three methods that are acceptable to the Muclear Regulatory Commission staff for complying with the identified criterion. The method described in Position C.1.b requires that those thermal overload protection devices that are normally in force during plant operation should be bypassed under accident conditions. This position has been implemented at Watts Bar and Bellefonte Muclear Plants. Regulatory Position C.1 also requires that the bypass system circuitry conform to certain sections of IEEE 279. IEEE 279 Section 4.10 requires that devices used to derive the final system output signal be tested. These devices are the relays that actually perform the overload bypass. At Watts Bar Buclear Plant, the testing of these devices is accomplished by pushing a test button at each motor control center, and observing that the relay for each individual valve operates. The relay operation is verified by checking to see if the relay indicator window, located on the side of the relay, changed state. The Regulatory Position also requires that the bypass system circuitry conform to Section 4.13 of IEEE 279. IEEE 279 Section 4.13 requires that a continuous indication of bypass be in the main control room if the protective action or some part of the system has been bypassed or deliberately rendered inoperative for any purpose. This section does not apply since no part of the protective action is bypassed during the test. Indication is provided in the main control room that the overload bypass signal has been initiated. The method of testing described above is acceptable for this application because it verifies relay operation by observation of a positive action. The licensing basis is satisfied in that the thermal overload bypass can be tested using one operator to initiate the test and a second operator some distance away to verify mechanical operation of the relay.
- (2) A test circuit modification to improve operating flexibility and convenience has been approved by EH DES. See design change request WB-DCR-482 (DES 830701 009); M. M. Sprouse to H. S. Green, September 21, 1983 (WBF 830921 056); and H. J. Green to M. M. Sprouse, Hovember 30, 1983 (DES 831201 012). When implemented, it will be possible for the operator initiating the test to determine that all bypass relays for a motor control center have operated by observing one test light.
- (3) At Bellefonte Suclear Plant, the testing of the overload bypass is accomplished by pushing a test button at each motor control center, and observing that an indicator light came on. This indicator light is wired up such that each overload bypass relay would have to operate before the light would come on. This also satisifies Regulatory Position identified in EC 1.106 and IEEE 279 Section 4.10. IEEE 279 Section 4.13 does not apply for the same reason given in 5.8(1). EC 1.106 came into effect at different construction phases of TVA's various nuclear plants. It is not a requirement that all TVA's nuclear plants be identical. In fact, different design organizations are performing the detail design for each plant and such things as expense and equipment availability are weighed heavier than making all plants identical.

EVALUATION SHEET

Rev.  $\frac{R2}{3/1/84}$ 

1. Task Force Category 39 for Watts Bar Muclear Plant - Unit 2

2. Task Force Category Description and Related Watts Bar Huclear Plant Unit 1 B&V Findings: The specific configuration of 6.9-kV bundled cables in trays has not been tested for the effects of fire retardant coating on the ampacity of the cable: G901

# 3. Evaluation for Cause

A. Preliminary

TVA considered the tests performed to determine fire retardant coatings' effect on ampacity of cables to adequately justify not derating cables due to fire retardant coatings. Determination of cause(s) will be done if evaluation in step 5 shows licensing basis is not satisfied.

B. Final

Refer to 5.A.B, Licensing Basis Satisfaction.

Resp. Org. R.L. Surallows 11/10/83 Task Force Concurrence

4. Evaluation for Generic Examples

A. Preliminary

This finding indicates that other similar examples exist.

B. Final

N/A

Resp. Org. Q. t. Sandles 11/10/83 Task Force Concurrence 24/1/983

A. Preliminary

Licensing basis satisfaction needs to be determined by evaluating the effects of the fire retardant coating on the ampacity of the 6.9-kV cables when the cables bundled together in trays.

B. Final

See Continuation Sheet (page 7).

## BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

# 5. Licensing Basis Satisfaction

#### B. Final

The licensing basis is satisfied because there is no significant effect on cable ampacity of installed 6.9-kV bundled 3-phase cables due to applied cable coating. An independent test showed that tightly packed power cables coated with Vinasco allows heat transfer just as good as air.

For short circuit ratings, TVA uses a minimum 2/0 AMG cable size for shielded power cable applications (6.9-kV service at WBH), which is conservative from an ampacity viewpoint. When routed in cable trays, these 2/0 AMG cables may be installed random lay (side-by-side with no space between cables). Shielded power cables larger than 2/0 AMG (4/0 AMG through 500 MCM) are grouped as 3-phase feeders and stacked in pyramids and separated from other grouped cable bundles by a nominal distance equal to the radius of the largest cable. A typical worst case arrangement of these cables is shown in Detail B of Figure 1. This spacing is provided to minimize the induced electro-motive forces (EMF) between phases when the cables are under load, and it does provide a more conservative design to more readily allow produced heat to be dissipated. However, the minimum spacing between cable bundles may be less where cables enter or exit the tray and at tray fittings, such as tees and crosses (i.e., the cable bundles may be in contact with each other).

The ampacities of shielded power cables installed in cable trays are determined from Electrical Design Standard DS-El2.1.2 for 90° C maximum copper conductor temperature in a 40° C ambient. The ampacity values for these cables given in DS-El2.1.2 are more conservative than the 80 percent factor suggested in ICEA S-54-440 for converting ampacities of cables in free air to cable trays. The cable designer considers ampacity derating of power cables when he sizes the cable for its application, including short circuit handling capability and to maintain suitable voltage regulation. In addition, motor circuits are conservatively sized for 125 percent of motor ratings.

Where cable coating is required to meet fire protection requirements, it is TVA practice to coat exposed surfaces of cables including the spaces between bundles of shielded power cables. The coating is applied to a nomina; 3/16-inch  $\pm 1/16$ -inch wet thickness. With reference to Detail B of Figure 1, it should be noted that the coating itself between cable bundles is not a heat source; instead the coating is an excellent conductor of heat, based on independent laboratory tests.

Testing performed for Vimesco by the Factory Mutual Research (FM) (Report No. J.I. OFOQ5.AF) concluded that with two wet coat thicknesses of 1/8-inch each (1/4-inch maximum thickness which is upper limit of TVA design), applied sequentially between tests, the ampacity decreased only by 1.62

#### B. Final

percent, which TVA considers insignificant. The FM tests were performed on power cables arranged in cable trays, uniformly stacked three cables deep, as shown in Detail A of Figure 1. The intent of the cable arrangement was to simulate a 40 percent tray fill (the actual fill was 43 percent) and to have all cables (except the ones located in the corners of the tray) touch other cables on at least three sides. This arrangement essentially eliminates air paths (convection) between the conductors and causes an opposite effect in that there is one heat source surrounded by other adjacent heat sources. For this reason, the tests as performed represent a worst case situation. The 2/0 AWG cables shown in Detail B of Figure 1, represent the same configuration as that tested, in that cables touch each other. The majority of the cables are 2/0 AWG for 6.9-kV service. Again, the coated 3-cable bundles do not touch, except as described above, and the coating provides a conductive path for heat dissipation. Furthermore, the test shows the heat transfer between the tightly packed cables coated with Vimasco and air paths is so good that the coating need not be considered in the design of the cable system.

Based on the above evaluation, TVA concludes that the installed cable configuration, including cable coating, requires no further derating of the cable bundles, and it satisfies the licensing basis.

March 1, 1984 - Nonconformance WBNEEB 8401R2 (EEB 840214 918) identified a significant condition in which documentation was not available to show that Class IE 6900-volt cable will not exceed its rated maximum continuous copper temperature of 90 C when installed in cable trays and covered with flame retardant coating.

A study (EEB 840203 901) was performed which showed that adequate ampacity exists for cables after derating for the cable coating. Therefore, the licensing bases is satisified.

# FAILURE AND SAFETY EVALUATIONS FOR CATEGORY 4

# Description\*

Failure to design the auxiliary feedwater system as specifically described in the FSAR.

# Discussion

Several minor documentation discrepancies were identified which were judged to represent no safety concerns. The other findings included discrepancies concerning: (1) ERCW to AFW valve control switch wiring, (2) thermal overload and torque switch bypass circuitry, (3) containment vessel modeling and minimum eccentricity requirements, and (4) piping design input spectrum limits and seismic spectral responses. These and their generic examples were reviewed and no conditions which jeopardize the safe operation or safe shutdown of the plant were identified.

# Conclusion

These deviations, had they not been identified and corrected, would not have prevented the performance of any nuclear safety function.

\*EN DES Calculation, Black and Veatch Task Force Category 4 - Discrepancies
Between FSAR and Design Documents (NEB 840319 219).

# SAFETY EVALUATION FOR CATEGORY 11

# Description\*

Flanges for the safety injection system pressure relief valve 1-63-627 fail to qualify for the normal operating conditions.

## Discussion

As a result of Black and Veatch finding F331 and F373, two flanges for the safety injection system pressure relief valve 1-63-627 were identified as failing to qualify for the normal operating conditions but are qualified for the faulted conditions. This pressure relief valve is downstream of the train B RHR heat exchanger and upstream of valve FCV-63-94-B containment isolation valve. Valve 1-63-627 protects the piping system against overpressurization and its discharge flows into the pressurizer relief tank. The failure evaluation concluded that the flange qualification failure will decrease the operating life of the flange and increase the possibility for flange leakage. This leakage results from a gradual degradation of the flange bolts but a flange bolt break will not occur. The flange leakage will not prevent the valve from performing its pressure relief function.

# Conclusion

This deviations, had it not been identified and corrected, would not have prevented the performance of any nuclear safety function.

\*EN DES Calculation, Black and Veatch Task Force Category 11 - PROB N3-63-5A Safety Evaluation (NEB 840316 221).

## FAILURE SAFETY EVALUATION FOR CATEGORY 14

## Description\*

Various supports in the auxiliary feedwater system of Watts Bar unit 1 were not modified, redesigned, or initially designed per the revised analysis of ECN 2576.

## Discussion

There were 382 generic deficiencies identified in various Watts Bar unit 1 systems. The problem was not applicable to unit 2. Six of these 382 represented conditions for which changes were warranted to improve resultant construction. Failure evaluations for three of the six support deficiencies concluded that pipe failure would not occur as a result of the deficiencies. Safety evaluations for the other three support deficiencies concluded that even if pipe failures resulted, these failures would be accommodated within system nuclear safety requirements.

# Conclusion

These deviations, had they not been identified and corrected, would not have prevented the performance of any nuclear safety function.

\*EN DES Calculation, Black and Veatch Task Force Category 14 - Seismic Support Review - Safety Evaluation Revision 1 (NEB 840316 222).

# SAFETY EVALUATION FOR CATEGORY 23

# Description\*

There were no provisions in the control circuit for torque switch bypass and thermal overload bypass indication in the main control room for FCV-1-51.

# Discussion

These supplemental design features would mitigate the consequences of certain single failure (i.e., valve steam binding). Their failure to be designed does not prevent valve operation. Their failure to mitigate certain single failures does not cause the single failure to have an impact greater than assumed in the safety analysis. Therefore, these design deficiencies do not create a safety problem from the single failure criterion standpoint.

# Conclusion

These deviations, had they not been identified and corrected, would not have prevented the performance of any nuclear safety function.

\*EN DES Calculation, Black and Veatch Task Force Category 23 - FCV-1-51 Safety Evaluation Revision 1 (NEB 840316 223).

# SAFETY EVALUATION FOR CATEGORY 30(2)

## Description\*

Inadequate current overload protection for the motor-driven feedwater pump lube oil pump and the electro hydraulic actuator motors on valves 1, 2-PCV-3-122 and 1, 2-PVC-3-132.

# Discussion

As a result of the Black and Veatch independent review it was identified that there was inadequate current overload protection for the motor-driven auxiliary feedwater pump lube oil pump and the electro hydraulic actuator motors on valves 1, 2-PCV-3-122 and 1, 2-PVC-3-132. The current overload protection is intended to reduce the consequencies of a fault and not prevent a fault. The range of possible failure modes that could result in overload currents include shorted windings to locked rotors. The absence of thermal overload protection could result in equipment becoming inoperable if a fault occurred. The lack of current overload protection would not prevent the safe operation or the safe shutdown of the plant based on two facts: (1) The function  $\mathcal{A}$  i protective device is to reduce the consequences of a fault and does not initiate or prevent the fault, (2) The credible worst case scenario is within the plant design basis which includes provisions for initiating events as well as single failures such as the loss of one motor-driven auxiliary feedwater pump (reference WBM FSAR, Section 10.4.9.1).

# SAFETY EVALUATION FOR CATEGORY 30(2)

(Continued)

# Conclusion

These deviations, had they not been identified and corrected, would not have prevented the performance of any nuclear safety function.

\*EN DES Calculation, Black and Veatch Task Force Category 30 - Safety

Evaluation of Inadequate Electrical Protection on Motors (NEB 840207 220).

#### APPENDIA D

# SAFETY EVALUATION FOR CATEGORY 35

## Description\*

Instantaneous trip setting for motor-operated valve breakers is not in accordance with EN DES criteria and vendor recommendations.

# Discussion

As a result of Black and Veatch finding F137, 444 Class IE circuit breakers were identified that had instantaneous current trip settings higher than the 1300 percent above motor full load current specified by the National Electrical Code and EN DES Standard DS E9.21. These high trip settings did not provide the proper short-circuit coordination between the circuit breaker, and their respective thermal overloads and under fault conditions equipment damage can occur. While these high trip settings were found to violate good design practice and could lead to a motor control center failure, the high trip settings would not prevent the safe operation or the safe shutdown of the plant. This conclusion is basel on the facts that (1) the function of a protective device is to reduce the consequences of a fault and does not prevent the fault, and (2) the credible worst case scenario is within the plant design basis which includes provisions for initiating events as well as single failures such as the loss of a IE motor control center (reference WBN FSAR, Section 8.3.1).

# Conclusion

These deviations, had they not been identified and corrected, would not have prevented the performance of any nuclear safety function.

\*EN DES Calculation, Black and Veatch Task Force Category 35 - Safety Evaluation of High Instantaneous Current Circuit Breakers Settings (NEB 840207 222).

Page 8 of 9

## APPENDIX D

# SAFETY EVALUATION FOR CATEGORY 37

# Description\*

The configuration of valve control circuits allows both the red and green indicating lights on the unit control board to be dimly lit upon the malfunction of the P-Auto contact in the open position.

## Discussion

As a result of Black and Veatch finding F112, 28 valve control circuits were identified that would allow the red and green indicating lights on the unit control board to both dimly light when a switch contact malfunction occurred. This results from a sneak circuit in the existing design and can mislead the operator concerning the valve's position. When both lights are brightly lit the valve is between fully closed and fully open. When the red light alone is brightly lit the valve is open and when the green light alone is brightly lit the valve is closed. Having both lights dimly lit could falsely lead the operator to think that the valve was in travel while, in fact, it was either fully closed or fully open. Twenty-four of the twenty-eight valves affected are isolation valves and the remaining four valves control flow from the refueling water storage tank to the chemical and volume control system charging pumps. No operator action to safely mitigate an accident requires the valve position indications. The sneak circuits does not interfere with the electrical circuits used for the manual control of the valve positions. The existing design basis accommodate single failure such as a malfunction of a control switch P-Auto contact through design of redundant and independent trains.

APPENDIX E

Glossary of Terms

The evaluation of the information resulting from the independent design review required the use of some nonstandard terminology. This appendix describes the meaning and application of these terms within this report.

Licensing commitments - All docketed commitments relevant to the work
activities of designing and constructing as well as to the management systems
for controlling, inspecting, testing, auditing, and recording these work
activities.

Licensing bases - Those bases and criteria for design/construction specified in TVA's licensing application to meet the functional licensing requirements. These include design and construction work process specifications (i.e., welding code), as well as product specifications (i.e., hanger dimensions) which were developed from other licensing commitments. The licensing bases are the subset of all licensing commitments which does not include management controls.

l. Task Force Category 3 for Watts Bar Nuclear Plant - Unit 1

2. Task Force Category Description and Related B&V Findings: Logic/control drawings do not agree with electrical drawings: F101, F102, F103, F104, F105, F106, F107, F110, F111, F114, F115, F116, F117, F123, F124, F127, F129, F130, F131, F141, F802, F803, F804, F805, F806.

## 3. Evaluation for Cause

- A. Preliminary
  - Inadequate drawing/checking of drawing prior to issue.
  - Inadequate recognition of need to revise companion drawings during design change process.
- B. Final
  Failure to consistently implement design review procedures as required
  in EN DES engineering procedure EP 4.25, "Design Review and Interface
  Coordination of Detailed Construction and Procurement Drawings."

Resp. Org. ansopp 3/14/84 Task Force Concurrence 2/16/84

- 4. Evaluation for Generic Examples
  - A. Preliminary

Problem is generic to logic, control, schematic, and connection drawings throughout WBN Unit 1.

B. Final - To determine generic implications, WBP reviewed the component cooling (70), containment spray (72), and residual heat removal systems (74) to identify mismatches in the logic, schematic, and connection diagrams for those systems. WBP then evaluated the seriousness and important of each mismatch and of the aggregate. Based upon this review, WBP concluded that the present TVA design for all safety systems is fully adequate for correct installation and operation of Watts Bar Nuclear Plant, with two exceptions: (1) instantaneous trip settings of molded case circuit breakers, (2) functional errors on logic diagrams. See Continuation Sheet (page 7).

Resp. Org. amesoph 3 1/4/84 Task Force Concurrence 1/2 free 3/16/84

- 5. Licensing Basis Satisfaction
  - A. Preliminary

Not satisfied for safety systems identified in FSAR section 7. Satisfied for all other systems.

B. Final - FSAR Section 7 identifies functional safety requirements for all safety systems. The licensing bases was not violated for any of the identified Black and Veatch findings in this category. However, the expanded, three system review described in Section 4 revealed licensing problems in two areas: (1) licensing basis was not satisfied for instantaneous ttripsettings for molded case circuit breakers, (2) licensing commitments were not satisfied for logic diagram functional requirements.

Resp. Org. amisoph 3 14/84 Task Force Concurrence

- 6A. Identification and Evaluation of Ongoing Corrective Action for Completed Work
  - A. Preliminary

NCR SWP 8267 (currently nonsignificant) and ECN 3683 only address correction of B&V identified drawing errors in the auxiliary feedwater system. TVA's Level 1 response to B&V finding F101 does not address all the effects of the existence of inaccurate drawings during design, construction, and operation.

B. Final

No ongoing corrective action was in place at the time of the Black and Veatch review.

Resp. Org. amisoph 3/14/84 Task Force Concurrence 3/16/84

- 7A. Identification of Corrective Action for Completed Work
  - A. Preliminary

All safety system logic, control, schematic, and connection diagrams need to be reviewed and revised to be consistent with design criteria and each other. As discrepancies are corrected, the impact on internal safety analyses and previous licensing submittals must also be evaluated.

B. Final - WBP initiated the following ECNs to incorporate corrective actions for the findings identified in this category: 3647, 3650, 2816 and 3683. The following FCRs were also accepted from CONST: E3458 and E3508. Additionally, WBP initiated ECNs 4358 and 4360 to correct findings identified in the expanded, three safety review addressed in Section 4. ECN 4666 has been issued to correct logic diagram errors identified in the FSAR logic review, also described in Section 4, to be completed by march 30, 1984.

10B. Identification of Corrective Action for Future Work

# BLACK & VEATCH EVALUATION SHEET (Continuation Sheet)

Evaluation of Generic Examples

B. Final (Continued)

WBP has previously addressed instantaneous trip settings on Black and Veatch category 35, including all generic examples and corrective actions. WBP is presently checking all logic diagrams contained in the WBNP FSAR against the appropriate schematic diagrams to identify any additional functional mismatches. This review will be completed by March 30, 1984.

SUBJECT:

ASSESSMENT OF ADEQUACY OF CORRECTIVE ACTION FOR BLACK AND VEATCH TASK FORCE

CATEGORY 3 - WATTS BAR UNITS 1 AND 2

For this category, the TVA task force for review of Black and Veatch findings determined that corrective action was required for completed and future work. QMS performed a surveillance in accordance with the attached scoping document to assess the adequacy of corrective action implementation for completed and future work, as well as the effectiveness of corrective action for future work. The results of that surveillance, contained in the attached surveillance report, verified the adequacy of the work accomplished.

Based upon our assessment of category 3, we conclude that this category can be closed by signing and dating item 12A, "Verification of Effectiveness of Corrective Action for Future Work."

QUALITY HAMAGEMENT STAFF
SURVEILLANCE REPORT FOR THE ASSESSMENT
OF THE EFFECTIVENESS OF CORRECTIVE ACTIONS
IDENTIFIED IN THE TASK FORCE REPORT ON THE
BLACK AND VEATCH FINDINGS

PLANT: Watts Bar Nuclear Units 1 and 2

CATEGORY: 3

Prepared By: Donald ( White Date: 12/7/84 Date: 12.7.84

Concerns: NO /X / Yes / / (if yes, identify below) Results:

I. Management Summary:

The design processes evaluated are outlined in the attached surveillance scoping document and were determined to be in compliance with requirements.

II. Conclusions and Recommendations:

Based upon the results of this surveillance, implementation of corrective action for completed and future work has been accomplished as committed by the TVA task force evaluation sheets for category 3.

#### III. Details:

- A. Performed the following surveillance activities to verify implementation of corrective action for completed work:
  - Sample one or more systems selected for the generic review and compare the sampling results to the review results.

Results: For this sample review, the containment spray system (system 72) was selected to verify logic, control, schematic, and connection diagram compatability. The technical review and evaluation for sections III.A.1 and III.A.2 of this surveillance report were performed by Frank E. Denny, an electrical engineer in the Quality Hanagement Staff. The following diagrams were used for the sample review:

Logic Diagram Control Diagram Schematic Diagram Connection Diagram

47W611-72-1 R12 47W610-72-1 R11 45W760-72-1 R9 45W1645-9 R13
45W1724-1 R5
0126D4529 R905
0126D454\*2-3 R913

Page 1 of 5

Specific components were selected from logic diagram 47W611-72-1 R12 to verify compatibility. Component selection included four switches, IS 72-10, HS 72-10A, HS 72-10B, and HS 72-10C, three of which provide start/stop signals to the containment spray pump B and a transfer switch. Sample review results revealed no discrepancies regarding diagram compatibility for the identified switches.

TVA's generic review results for the diagrams identified above are stated below. Discrepancies identified during the review were to be corrected under ECMs 4358 and 4360, as appropriate.

| Diagram and Revision at | Diagram and Revision That Incor |
|-------------------------|---------------------------------|
| Time of TVA Review      | porated ECMs 4358 and/or 4360   |
| 47W611-72-1 R9          | 47W611-72-1 R10 (BCN 4358)      |
| 47W610-72-1 R10         | No discrepancies identified     |
| 45\760-72-1 R6          | 45W760-72-1 R8 (ECW 4358)       |
| 45N1645- , R8           | 45N1645-9 R12 (ECN 4358)        |
| 45W1724-1 R3            | No discrepancies identified     |
| 0126D4529 R5            | No discrepancies identified     |
| 0126D4542-3 R11         | No discrepancies identified     |
|                         |                                 |

 Sample one or more logic diagrams in FSAR and compare to schematic diagrams to identify any functional mismatches.
 Compare these sampling results to those results obtained for the similar review.

Results: For this sample review, the safety injection system (system 63) was selected to verify whether functional mismatches existed between the logic and schematic diagrams. The following diagrams were used for the sample review:

#### Logic Diagram

Schematic Diagram

47W611-63-1 R6

45W600-99-1 R4 1082H70 R V

Here again, specific components were selected from the logic diagram for the verification. Component selection included two manual safety injection signal switches HS 63-133A and HS 63-133B and a safety injection signal reset switch HS 63-134A. Sample review results revealed no discrepancies regarding functional mismatches for the identified switches.

TVA's FSAR logic review results revealed discrepancies with logic diagram 47W611-63-1. Discrepancies identified during the review were to be corrected under ECNs 4666 and 4667, as appropriate. Logic diagram 47W611-63-1 was revised to

Page 2 of 5

incorporate ECMs 4666 and 4667. This was accomplished under R5 to 47W611-63-1.

 Sample deficiencies identified to verify completed or controlled corrective action.

Results: J. C. Standifer's memorandum to H. L. Jones dated September 29, 1983 (WBP 830929 024), documented the results of TVA's three system generic review. TVA issued ECMs 4358, 4359, and 4360 to correct mismatches in the logic, control, schematic, and connection diagrams as a result of the review. TVA also issued ECMs 4666 and 4667 to correct functional mismatches in the logic and schematic diagrams as a result of the FSAR logic review. Activities associated with these ECMs have been completed. The following identifies each ECM and respective closure sheets.

| <u>ecn</u> | Closure Sheet No.    |
|------------|----------------------|
| 4358       | 121 (WBP 840223 555) |
| 4359       | 118 (WBP 840123 506) |
| 4360       | 118 (WBP 840123 506) |
| 4666       | 133 (WBP 840608 500) |
| 4667       | 133 (WBP 840608 500) |

B. Performed the following surveillance activities to verify implementation of corrective action for future work:

Verify implementation of EP training to NEB 820226 255 by selected section(s) responsible for this work:

Results: I&C BP training rosters were observed to verify that BP training had been conducted for BP 4.25. The observation revealed that an BP training roster did exist for BP training on BPs 4.01, 4.02, 4.04, and 4.25. This training was conducted by L. T. McCord July 28, 1982.

C. Performed the following surveillance activities to assess the effectiveness of corrective action for future work:

Assess the effectiveness of the EP training based upon the evaluation of the adequacy of some work output (work which was initiated after July 28, 1982).

Results: For this assessment, a working ECN 5231 (issued Movember 6, 1984) initiated by the I&C section of WBEP was selected for review because the change warranted revisions to electrical logic diagrams and possible schematic and connection diagrams. The review of ECN 5231 was an attempt to verify adequate implementation of design change control requirements

Page 3 of 5

where branches/groups/sections other than I&C may be affected. ECN 5231, in part, required the I&C section to revise logic diagrams 47W611-3-3 R5 and 47W611-3-4 R5 to identify specific time delay relay settings for valve actuation as a result of preoperational tests conducted at WBM. Logic diagram 47W611-3-3 R5 was revised to depict a 4-second time delay relay setting for flow control valves FCV-3-136A and FCV-3-136B and an 8-second time delay relay setting for flow control valves FCV-3-179A and FCV-3-179B. Logic diagram 47W611-3-4 R5 was revised to depict a 7-second time delay relay setting for level control valves LCV-3-173 and LCV-3-174.

The logic diagrams were squadchecked (squadcheck No. JLD-97) to the wiring section of WBEP to evaluate the changes for possible revisions to schematic and connection diagrams. Through the squadcheck process, the wiring section revised schematic diagram 45N600-57-5 R5 to depict a 4-second time delay relay setting for relays TD1 and TD2 associated with flow control valves FCV-3-136A and FCV-3-136B and an 8-second time delay relay setting for relay TD3 associated with flow control valves FCV-3-179A and FCV-3-179B. Schematic diagram 45N600-57-22 R3 was revised to depict a 7-second time delay relay setting for relay 74-B (train B) associated with level control valves LCV-3-173 and LCV-3-174. Connection diagrams were not revised as a result of the changes. Wiring section personnel stated that time delay relay settings are identified on schematic and logic diagrams only. Parallel squadchecks were also issued by the I&C section of WBEP to EEB (squadcheck No. 6066) and MEB (squadcheck No. 6069) for evaluation of the proposed changes associated with ECN 5231. It should be noted that the specific changes identified above were observed "on-the-board" awaiting verification and approval by BEB.

It is evident that the I&C section of WBEP has implemented adequate design change control requirements regarding changes prompted by BCN 5231. This appears to be indicative of the EP training identified in B.1. above.

I. Verification of Corrective Action Implementation for Completed Work

Perform the following surveillance activity:

Sample one or more systems selected for the generic review and compare the sampling results to the review results. Sample one or more logic diagrams in FSAR and compare to schematic diagrams to identify any functional mismatches. Compare these sampling results to those results obtained for the similar review. Sample deficiencies identified to verify completed or controlled corrective action.

II. Verification of Corrective Action Implementation for Future Work

Perform the following surveillance activity:

Verify implementation of EP training to NEB 820226 255 by selected section(s) responsible for this work.

III. Assessment of Effectiveness of Corrective Action for Future Work

Perform the following surveillance activity:

Assess the efficieness of the EP training based upon the evaluation of the adequacy of some work output (work which was initiated after July 28, 1982).
