Why is there no zero figure for the total amount of water in the aquifer ya'll want to take water from?

Not even one syllable about climate change. I want ya'll to recognize that the drier (less amount of rain) the atmosphere, the more water will be pumped from the underground aquifer.

I want an indepth study on this point please.

I thank you.

Because we only have one planet to work with.

Sun-cerely,

Peter Fox Sipp
