The Advisory Committee met at the Nuclear Regulatory Commission, Two White Flint North, Room T2B3, 11545 Rockville Pike, Rockville, Maryland, at 10:00 a.m., Dr. Michael T. Ryan, Chairman, presiding.

MEMBERS PRESENT:

- MICHAEL T. RYAN, Chair
- ALLEN G. CROFF, Vice Chair
- JAMES H. CLARKE, Member
- WILLIAM J. HINZE, Member
- RUTH F. WEINER, Member

2
3 CHAIR RYAN: Come to order, please. The
4 meeting will come to order. This is the first day of
5 the 186th meeting of the Advisory Committee on Nuclear
6 Waste and Materials. During today's meeting the
7 Committee will consider the following; discussion of
8 ACNW letter reports, recommendations by the
9 International Commission on Radiological Protection in
10 their Final Report 103, Corrosion of Waste Package and
11 Spent Fuel Dissolution in a Repository Environment.

12 Neil Coleman is the designated federal
13 official for today's session. And Antonio, until he
14 gets here, you'll be the designated federal official,
15 if you please.

16 ANTONIO: I'm here. Okay.

17 CHAIR RYAN: All right, Neil Coleman has
18 just arrived. We have received no written comments or
19 requests for time to make oral statements from members
20 of the public regarding today's sessions. Should
21 anyone wish to address the Committee, please make your
22 wishes known to one of the Committee staff.

23 It is requested that speakers use one of
24 the microphones, identify themselves and speak with
25 sufficient clarity and volume so they can be readily

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

www.nealgross.com

1 heard. It's also requested that if you have cell
2 phones or pagers, you'd kindly turn them off at this
3 time. Feedback forms are available at the back of the
4 room for anyone who would like to provide us with his
5 or her comments about the meeting.

6 Without further delay, I'll turn over the
7 meeting to our cognizant member, Professor Hinze, who
8 is going to lead us in a discussion of the Committee
9 Letter on Post Closure Degradation of Emplacement
10 Drifts and its Impact on Engineered Barrier System
11 Performance at the proposed Yucca Mountain High Level
12 Radioactive Waste Repository. Professor Hinze.

13 CHAIR RYAN: For this portion, we will go
14 off the record. We don't need to have this letter
15 writing on the record. We'll reconvene the record at
16 1:00 o'clock when we pick up on the ICRP work. So
17 with that, we'll close the record at this point.
18 Thank you.

19 (Whereupon, the record was recessed to
20 reconvene at 1:00 p.m. the same day.)

21 (On the record at 1:01 p.m.)

22 CHAIR RYAN: All right, if I could ask
23 everybody to come to order, please. We will go back
24 on the record for our afternoon session. And our
25 first -- is there anybody on the bridge line, please?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Anybody on the bridge line? Nobody is there, okay,
2 that's fine. They'll beep when they come in and I
3 might interrupt you, Don, so we can get them to
4 introduce if they do come in.

5 We'll hear from Dr. Donald Cool on the
6 International Commission's Final Report 103 on basic
7 radiation protection standards. Without further ado,
8 Don, take it away.

9 DR. COOL: Okay, thank you, Mr. Chairman.
10 We have interacted often as the International
11 Commission on Radiological Protection has worked its
12 way through the extended process of developing its
13 revised recommendations. I'm here today to give you
14 a brief overview of the conclusions and see if we can
15 make the computer work. Sure enough. Okay. ICRP
16 Publication 103 made available on December 18th of
17 2007. If you go to ICRP's website, there's a little
18 announcement. If you click on that, you get a little
19 word document which tells you the various and sundry
20 places where you can buy it or download it, et cetera.

21 So it is now available and out there for
22 discussion and use. The report is just a small
23 document. This is printed double-sided, 332 pages or
24 so counting the appendices. I would note that a good
25 half of these, you can see where the red tabs are part

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 way through this, a good half of it is appendices
2 material which actually supports the text of the
3 recommendations themselves. What I hope to do in
4 cumulus today is just briefly remind you of the things
5 that are in there and quickly go over the extent to
6 which the NRC's comments did or did not influence the
7 draft and then briefly talk about the next steps as
8 the staff moves forward now that ICRP has completed
9 its particular piece of the work.

10 ICRP Publication 103 has an introduction,
11 chapters related to the aim and scope of the
12 recommendations, biological aspects, the quantities,
13 system of radiological protection, the implementation
14 of those recommendations, medical exposure, protection
15 of the environment and then two annexes, one related
16 to the health risks attributable to ionizing radiation
17 and one related to the quantity. Those two annexes
18 were last seen when the staff commented on early
19 drafts of them several years ago when they were
20 published as independent foundation documents.

21 In fact, we had not had a chance to review
22 and comment on them for more than two years. So,
23 we're still in the process of sorting through all of
24 the information that's in there, so I'm just going to
25 give you some sort of general observations today.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Main features, not particularly surprising because
2 we've known mostly what was in the draft for a
3 considerable period of time. They updated the
4 radiation and tissue weighting factors. They
5 maintained the three fundamental principles,
6 justification, optimization and dose limitation.

7 You'll recall from our earlier draft there
8 had been a much shortened discussion on justification.
9 That has been re-elaborated some as we move to the
10 final draft and this final version. They moved to a
11 situation based approach. As in three fundamental
12 exposure situations, a planned exposure situation, any
13 time you're planning to do something, most everything
14 that we would license here falls into that category;
15 an emergency exposure situation where it's gotten out
16 of control and you need to do something now, typical
17 emergency planning type activities and existing
18 exposure situations. It's out there, you sort of trip
19 across it or decide that you now need to do something
20 about it. It may or may not have been under control
21 previously, et cetera, but it now has to be dealt with
22 in some form.

23 CHAIR RYAN: Don, let me just if I may, I
24 think the tissue weighting factors is really a
25 technical calculational thing and I understand that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 but I still struggle with your second and third bullet
2 in that I don't see anything different other than
3 terminology for the way radiation protection practice
4 is laid out, not just in 10 CFR 20 but in all the
5 other guides and foundation documents and all the rest
6 that go with that. Am I off base on that comment?

7 DR. COOL: Most of it is the way of
8 looking at things and explaining things. You're
9 correct. The three fundamental principles, that
10 hasn't changed at all.

11 CHAIR RYAN: Right.

12 DR. COOL: That fundamental approach has
13 been and continues to be as it is in Part 20 and --

14 CHAIR RYAN: Yeah, but justification,
15 optimization and all those terminologies from ICRP,
16 you can look at ALARA and, you know, all the other
17 kinds of terminologies that we use. I seen nothing
18 different in practice --

19 DR. COOL: Correct.

20 CHAIR RYAN: -- other than what you call
21 it. Okay. Thanks.

22 DR. COOL: And there they didn't even
23 really changes what they called it.

24 CHAIR RYAN: What they called it but
25 again, I'm not worried about what they're calling it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 What I'm saying is that nothing in this latest final
2 document would change the view that we could show a
3 one-to-one correspondence of what's done in the US
4 using our terminology compared to what's done under
5 ICRP with their terminology.

6 DR. COOL: Correct.

7 CHAIR RYAN: Okay.

8 DR. COOL: Correct. They've reinforced
9 optimization with constraints. And this is a place
10 where depending on where you are in the United States,
11 what kind of licensee you're talking about, it's a
12 description of the way things are done or it's a
13 description of how we might wish they did things but
14 they don't necessarily do it that way. Let me
15 explain.

16 If you are in the nuclear power industry,
17 then what they have here with constraints and
18 optimization is exactly the process that any of the
19 nuclear power plant radiation protection programs
20 behave. They set facility specific activities values
21 to make --

22 CHAIR RYAN: Excuse me, Don. Is that
23 somebody who joined the meeting?

24 MR. FITZPATRICK: Yes, Charles
25 Fitzpatrick, State of Nevada.

1 CHAIR RYAN: Welcome, Charles. Thank you,
2 go ahead, Don.

3 DR. COOL: So a power plant will establish
4 some specific value that they do not plan to exceed
5 and then they will work their ALARA optimization
6 process to try and further improve on that dose. That
7 is exactly what a constraint and optimization is. So
8 this is a well-established practice for a large
9 organization. You do not find that kind of discipline
10 and thinking in many of the smaller activities. You
11 may find some measure of optimization in medical
12 facilities and things. You find radiographers just
13 basically trying to do that job out there.

14 So if you look at it in the context of our
15 regulations, some licensees do this, some licensees
16 don't. Moving on --

17 CHAIR RYAN: I can't imagine an all ICRP
18 invoked countries that they're all doing the same
19 level of optimization at all those areas either.
20 There's nothing probably much different.

21 DR. COOL: No, no, what you have here is
22 ICRP moving the recommendations and the description
23 recommendations in part realigning with what has
24 become very good practice and the approach to really
25 doing a good job in radiation protection. So when

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 you're doing a really good job, this brings no new
2 information or value to the table. The point I'm
3 simply trying to make is that there are other places,
4 both here and in other parts of the world where that
5 higher level of approach and that kind of thinking has
6 not yet become the status quo of activities.

7 And they have included, as we have talked
8 about many times, an approach for developing a
9 framework on protection of the environment. We will
10 be back with you on Thursday afternoon to talk about
11 a draft report that the ICRP has for comment right now
12 which talks about this developing framework and
13 reference animals and plants.

14 CHAIR RYAN: Let me throw a question out
15 that maybe you'll handle later in the week. This
16 document, the ICRP 103, says that you're not going to
17 put a -- develop a formal system of dose calculations
18 for non-human species but that's exactly what 103
19 does.

20 DR. COOL: It says they're not going to
21 establish dose limits.

22 CHAIR RYAN: Dose limits.

23 DR. COOL: Dose limits.

24 CHAIR RYAN: So why develop a system of
25 calculating doses if there's going to be no limit?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. COOL: Well, in fact, I think if you
2 look at their words, what they are saying is they are
3 trying to put together a framework that would allow
4 you to do assessment. We do assessments in the
5 environment under the National Environmental Policy
6 Act.

7 CHAIR RYAN: Sure.

8 DR. COOL: This is a mechanism to do
9 assessments with an end point that isn't necessarily
10 specifically linked to humans to allow you to
11 demonstrate what protection is or isn't being afforded
12 by some particular control --

13 CHAIR RYAN: Well, that's the theory of
14 what they said it's supposed to do. You know, we'll
15 talk more about that on Thursday.

16 DR. COOL: We'll go through this in detail
17 on Thursday. We can have -- we can take the entire
18 afternoon discussing this and I don't think we're
19 quite ready to do that yet.

20 CHAIR RYAN: Fair enough. Fair enough.

21 DR. COOL: We have a whole other talk
22 ready for you at that time.

23 CHAIR RYAN: All right, great.

24 DR. COOL: Okay. Let me spend a couple
25 minutes and talk about the impact that NRC's comments

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 have had over this process. We have had many of our
2 editorial and specific comments that have, I believe,
3 directly contributed to significant improvement in the
4 text. We've suggested lots of things. They've done
5 a number of things. That's not to say that they did
6 everything, nor did they necessarily do it the exact
7 way we would have done it, something about American
8 English versus King's English.

9 They have done a considerable effort to
10 try and clarify constraints in their use because we
11 raised a number of issues. As it was originally
12 described, it did not seem to align with the way
13 radiation practice was actually conducted. That has
14 been much improved and we now have that alignment.

15 We very much wanted them to have the words
16 in there about the use and the areas of inappropriate
17 use for collective dose and those words are in there.
18 Although they didn't go so far as we had asked them to
19 which was to actually give us some quantitative
20 guidelines for when you would or wouldn't use
21 collective dose calculations.

22 CHAIR RYAN: What's missing on that score?

23 DR. COOL: Well, what you find in there is
24 the lovely statement that collective dose should not
25 be used for epidemiological purposes integrating over

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 all space and all time very small doses. What is not
2 there is anything that would allow us to understand
3 what the phrase "small doses" might be. So when you
4 boil it down and as you were briefed the briefing or
5 two ago by a researcher on the state of the art
6 consequence analysis, a question of what small doses
7 might it be reasonable to not include?

8 This would suggest to you that it's not
9 reasonable to include those small doses but it doesn't
10 give you any sort of help in actually sorting out what
11 the small doses would be that you wouldn't want to
12 include in the calculation. The ICRP unfortunately,
13 has to rely on unpublished and non-publically
14 available information. You'll recall that we had
15 specifically commented to them that it really should
16 have published sources available. This has gone ahead
17 and moved forward on a schedule they had advertised
18 and some of those materials are not yet available.

19 We had suggested to them that there were
20 a number of the tissue weighting factors, particularly
21 in the remainder category, which did not even seem to
22 comport with that which we understood to be
23 radiogenic. There were not changes in that so there
24 are the 13 tissues that remain in that remainder
25 category of tissues for evaluation. And we had

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 commented that we really thought that there was no
2 need for the chapter on protection environment given
3 that that chapter really didn't provide any
4 recommendations. It simply said we're going to
5 develop a framework and we're going to be looking at
6 some things. So it doesn't contribute to the
7 recommendations.

8 They've kept the chapter in. The good
9 news is that it doesn't actually provide any
10 recommendations. It doesn't give you something that
11 you would actually want to go out and try to create a
12 regulatory structure on it otherwise. It is a plan of
13 work, as it was in the last draft.

14 Now, that the ICRP has completed its
15 process, the NRC staff is initiating its effort to
16 prepare options for Commission consideration. A
17 number of years ago, go back to about 2001, actually,
18 the staff actually went to the Commission to seek
19 specific direction on whether or not to start
20 proceeding at that time to look at a revision of 10
21 CFR Part 20. We recommended and the staff agreed that
22 it would be better to wait for this ICRP
23 recommendations process to be completed so that we
24 could consider this material in any consideration of
25 possible revision rather than being in the same sort

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 of context that we were in last time where we were
2 essentially done with the revision of Part 20 when
3 ICRP 60 came out in 1990.

4 Now that ICRP is completed, the staff has
5 initiated its effort to go look at Part 20 and other
6 regulations to determine what things might warrant
7 update, what the options, what the costs would be
8 associated with that, the impacts, the wide variety of
9 things that we need to assemble to understand whether
10 or not to suggest doing something and what the
11 implications of that would be.

12 Now, I think it's safe to say that there
13 are some things, changes to the weighting factors and
14 some of the calculational material, which would
15 certainly warrant a very hard look and probably
16 updating. I would also note that there is
17 considerable interest within the staff to try and
18 update some of the regulations which were not revised
19 at the time Part 20 was revised in 1991; for example,
20 Part 50, Appendix I, which actually is the controlling
21 factor for all of the reactor effluents and otherwise
22 the underlying technical basis for that regulation and
23 guidance is still ICRP Publication 2. So there's a
24 considerable interest as we start to look to the
25 licensing of the new generation of reactors and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 otherwise to try and bring the entire suite of NRC
2 activities up to a new point.

3 That would tend to argue that there will
4 probably be some things that we will want to try and
5 consider but I am not here today to give you any
6 particular viewpoints on what will or will not be done
7 because we have only begun the process within the
8 staff and the various offices to try and catalog where
9 all of those different bits and pieces are, what the
10 impacts are to different groups, how you might
11 construct an option that would minimize some of those
12 impacts, what the impact of the backfit analysis and
13 other would be associated with that and you can tick
14 off any number of things that we will have to consider
15 over the next 10 months or so.

16 The staff is due to go to the Commission
17 with this options paper in December of this year. We
18 have a lot of work to do.

19 CHAIR RYAN: Don, are you going to publish
20 a plan of what you're going to do during this year?
21 Is there an outline or a plan or some other document?

22 DR. COOL: There is at this point no
23 published plan of work. I can't tell you that in
24 March we will be thus far and in April thus far, no.
25 The staff is just assembling the technical staff leads

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to try and catalogue the data and work through that
2 process.

3 CHAIR RYAN: You're sort of combing
4 through and gathering 10 CFR 61 and all the other
5 parts that are out of whack.

6 DR. COOL: Right, that's our first step in
7 the process.

8 CHAIR RYAN: Does that cover the Reg
9 Guides, too?

10 DR. COOL: Is to catalogue those and
11 certainly the guidance, regulatory guidance and other
12 things which are based on or derived from some of
13 those regulations will have to be looked at because a
14 lot of the impact and a lot of the cost of changing
15 and updating is in those pieces not just --

16 CHAIR RYAN: Yeah, I was going to say, we
17 looked at the Reg Guides in Division 8 and they are
18 many Reg Guides --

19 DR. COOL: Correct.

20 CHAIR RYAN: -- that don't even refer to
21 the numbers that -- I mean, the numbers they refer to
22 are out of use, per section.

23 DR. COOL: Yeah, so the step one is to
24 simply catalog the bits and pieces.

25 CHAIR RYAN: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. COOL: All the tentacles if you will
2 and then to try and understand how to eat this thing,
3 bits and pieces, how large to make that, whether it's
4 one large single effort, whether it's a set of
5 parallel efforts, and I'll add another complicating
6 factor on top of that which is in addition to the NRC
7 looking at our requirements across the board, it's the
8 coordination with the Department of Energy, the
9 Environmental Protection Agency, Occupational Safety
10 and Health, Department of Defense, FDA and others to
11 try move in a consistent coherent fashion so that the
12 Federal Government as a whole can be in a consistent
13 position with regards to radiation protection.

14 We're not today, but that's the goal which
15 we will try to seek. That will be done through the
16 Interagency Steering Committee on Radiation Standards.

17 CHAIR RYAN: The rubber meets the road
18 with the agreement states.

19 DR. COOL: And the agreement states.

20 CHAIR RYAN: So, I mean, that's where most
21 of the licenses exist.

22 DR. COOL: Yes.

23 CHAIR RYAN: And then, of course the non-
24 AEA regulation of medical and you know, other stuff
25 that's out there that's not part -- I mean, if it's an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 electronic product device, it's not regulated under
2 the AEA but they've got to use the same system of --

3 DR. COOL: Circulated by the states.

4 CHAIR RYAN: Right.

5 DR. COOL: And for the most part what has
6 been in Part 20 has been used by the states, certainly
7 in the agreement states.

8 CHAIR RYAN: Right, because they're not
9 going to make a separate rule.

10 DR. COOL: And they just apply it across
11 the board.

12 CHAIR RYAN: Right.

13 DR. COOL: So there is a significant area
14 there. We are planning to have state participation as
15 we go through this catalogue of options development
16 process. That's what I wanted to give you and I'll
17 entertain other questions, if you'd like.

18 CHAIR RYAN: Could you talk a little more
19 what the plan is with agreement states?

20 DR. COOL: The plan is to invite them have
21 one, maybe a couple of state people participate in the
22 staff working group that we will have to do the
23 catalogue and to start to develop the options. This
24 is the same kind of approach if this had been a more
25 formal rulemaking workgroup which would have formal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 state participation. It's not a rulemaking work group
2 because we're not yet in the process of writing rule,
3 but it's important to involve them in a similar sort
4 way through a working group process in order for them
5 to have input to the process.

6 CHAIR RYAN: Okay, Professor Hinze?

7 MEMBER HINZE: What's the title of this?
8 I missed that.

9 DR. COOL: I probably actually didn't put
10 the title on the slide. ICRP Publication 103, the
11 2007 Recommendations of the International Commission
12 on Radiological Protection.

13 MEMBER HINZE: Thank you. And what -- I
14 may be missing a good deal here but what are your
15 requirements in terms of following these, of the NRC
16 following these recommendations? What kind of legal
17 or moral, ethical requirements are there for us to
18 follow these recommendations?

19 DR. COOL: We have, by practice, tried to
20 use the ICRP, NCRP various recommendations in the
21 formulation of our requirements. There is no legal
22 mandate that we incorporate ICRP recommendations into
23 our regulations. Unlike the International Atomic
24 Agency, which actually has a statement that they will
25 try to be consistent with or incorporate to the extent

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 possible ICRP recommendations, they are a source of
2 information.

3 The fact that something exists in these
4 recommendations means that it is there to be
5 considered within our formal Administrative Procedure
6 Act rulemaking process. It does not mean that it must
7 be or otherwise adopted. All of this will have to go
8 through the process of consideration. It will have to
9 go through public comment. It will have to go through
10 analysis in terms of an Environmental Impact
11 Assessment that would go through the rulemaking and
12 back to the analysis all of those other bits and
13 pieces.

14 But it certainly is an important piece of
15 reference and in the existing environment where
16 globalization is becoming more and more important and
17 harmonization of regulatory requirements more
18 important for organizations, licensees, who are doing
19 business on both sides of the Atlantic and in Asia and
20 otherwise, there is an increasing pressure, again, not
21 mandate, that there be some consistency so that
22 they're not constantly having to demonstrate
23 compliance with multiple and different sets of values.

24 We see this in the nuclear power industry
25 where the effort for vendors to compete

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 internationally is increasing their desire that the
2 requirements here be the same as the requirements over
3 there. You see it in their reaction when there would
4 be an operational safeness review, an OSAR review of
5 the IAEA where they raise questions about why the US
6 standards are different. So there is a desire for
7 there to be international consistency.

8 Again, that has not become a mandate. It
9 becomes a piece of information that has to factor into
10 the rulemaking development process.

11 MEMBER HINZE: Thanks, Don, that does
12 help. I don't want to steal Mike's question, but if
13 you have crystal ball, where do you see this
14 recommendations or -- well, recommendations or
15 statements about protecting the environment from
16 radiation leading to? I mean, the clue to this
17 chapter again, some very good advice. Get your
18 crystal ball. What are we looking at here? What's
19 this a first step? Is this just a -- is this just a
20 twig that's grown off to the side or is this going to
21 develop into something?

22 DR. COOL: That's a very good question.
23 The crystal ball is very cloudy.

24 CHAIR RYAN: Good answer.

25 DR. COOL: If you polled a number of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 people you would be N plus 2 views. My personal view
2 of where I would like to see it move is to increase
3 the technical information that is available that
4 allows us to make assessments. Everything that has
5 been observed thus far, information that is available,
6 continues to support the general notion that the
7 controls in place in existing planned activities, a
8 licensee in terms of direct exposure situations,
9 releases to unrestricted areas, are providing
10 sufficient controls so that the environment in that
11 area is protected.

12 The question would be, we have to, under
13 NEPA, do assessments in the environment and otherwise
14 and it would be very useful if this information could
15 work in a way to support that which we must already
16 do, which is to be able to do assessments and to be
17 able to provide open and clear understandings of the
18 basis for what we would do. I don't believe at this
19 point, this is Donald Cool, not anybody else, that
20 this information should lead to actual changes to the
21 standards, but there are many who would wish to go
22 there.

23 CHAIR RYAN: Bill, if I could jump in, you
24 know --

25 MEMBER HINZE: I stole your question.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIR RYAN: No, that's fine and I agree
2 with Don's answer but, you know, I mean, there's 50
3 years -- 60 years of radiation biology that says if
4 you protect man, you're protecting the environment and
5 everything in it. I've asked the Chairman of the ICRP
6 show me an example that's not true. He hasn't given
7 me one yet. Now, I struggle with for example, I can
8 calculate an absorbed dose to anything, the table, the
9 cup, a crab, whatever I want to calculate it to,
10 that's a physical quantity, but interpreting that in
11 terms of rad to rem, that is what effect are you
12 interested in, that's when I jump off the train.

13 So I really have a great concern that what
14 is the assessment focused on. What we have done for
15 50 years, freight and transported radioactive material
16 in the environment. There are folks who can talk
17 about the benthic movement of plutonium, you know, for
18 weeks. I mean, there's all sorts of information about
19 freight and transported radioactive material in the
20 environment. Some more than others, but I struggle
21 with the intent and the use of these calculations,
22 assessments, whatever you want to call them because I
23 don't -- I don't understand what the end point is
24 they're aimed at.

25 MEMBER HINZE: Well, what is the stature

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of the technical basis for this 50 years?

2 CHAIR RYAN: I guess we'll hear that on
3 Thursday. Oh, for the 50 years?

4 MEMBER HINZE: Yeah, that we've used for
5 50 years, what is the technical -- what is the
6 stature?

7 CHAIR RYAN: Well, it starts out with, you
8 know, everything from basic cell survival studies,
9 right on through sophisticated radiation biology.

10 MEMBER HINZE: Do we have that codified in
11 some way? Do we have that brought together in some
12 singular fashion?

13 DR. COOL: I would suggest to you probably
14 not in the way that you might be thinking. If I've
15 written down someplace a scientifically document piece
16 of evidence that says, "Yea, verily this is true that
17 all of those have been protected"? No. That's part
18 of the difficulty that environmental groups and others
19 would constantly bring to your attention. All of the
20 assessments have been based on linkages of radioactive
21 material to various change leading to a dose to a
22 human. There hasn't been any systematic or
23 standardized separate assessment of a direct impact in
24 the environment.

25 Now, part of that is because there are a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 couple of fundamental questions which are not yet
2 resolved. First you have to figure out who are you
3 going to protect? Are you going to protect
4 individuals? Are you going to protect small groups of
5 individuals of something? Are you going to protect
6 populations, over what size?

7 The second thing you have to sort of try
8 and understand is, what are you going to protect them
9 from? Are you protecting individual bees, they're one
10 of the reference animals, from death or are you
11 looking at survivals of hives or are you looking in
12 general at the question of reproductive success of a
13 honey bee in general in some area? Are you looking at
14 morbidity, mortality, reproductive success? There
15 are different measures.

16 After that you have to have sorted out the
17 question of what kind of dose levels and what kind of
18 radioactive material levels in their environment or in
19 their bodies will get you to those effects? Those are
20 three very important questions. We don't have the
21 answers to any of those yet.

22 CHAIR RYAN: For any of the species they
23 want to propose.

24 MEMBER HINZE: Right.

25 DR. COOL: So we have a ways to go.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIR RYAN: There's another confounding
2 aspect to this and you know, there are studies. For
3 example at Chernobyl there was a very bright fellow
4 that was from West, I think Washington State, maybe
5 one of the universities out there that studied the
6 ecosystem that's around Chernobyl, and because people
7 have been removed from it, it's now more robust and
8 healthy than it's ever been.

9 You're seeing the return of several
10 mammals that have been long since gone and other
11 things. I just found it fascinating. And, you know,
12 his conclusion was that ecosystem is returning to
13 health in spite of Chernobyl, but it's because people
14 have been removed from the environment. So, you
15 know, and again, I'm not saying that's a success
16 story. By no means is it, but there's no pattern here
17 of something as simple as let's describe the geology.

18 I mean, it's just -- you know, it's not
19 clear to me how we're going to use these in referenced
20 species other than to stay busy thinking about them.
21 I don't see a goal or an end point but making an
22 assessment using absorbed dose or some other physical,
23 you know, manifestation of radiation interacting with
24 some animal or plant, I don't understand where it's
25 going to lead.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER HINZE: Well, should there be a
2 certain level of studies that --

3 CHAIR RYAN: Well, there have been. I
4 mean, there are decades. The Savannah River
5 Ecological Laboratory has studied the 300 square miles
6 at the Savannah River for 50 years. There's a
7 mountain of work in the area of radioactivity in the
8 environment.

9 MEMBER HINZE: But is that codified
10 someplace, you know?

11 CHAIR RYAN: What do you mean codified?

12 MEMBER HINZE: Well, by codified, brought
13 together so that --

14 CHAIR RYAN: Yes, yes.

15 MEMBER HINZE: -- one has a complete
16 description.

17 CHAIR RYAN: Absolutely.

18 MEMBER HINZE: You know, because what I'm
19 saying is that you go to a number of journal articles
20 and that --

21 CHAIR RYAN: There are books and journal
22 articles and studies and multi-year studies and 10-
23 year summaries and all that kind of stuff that's out
24 there. I mean, it is a robust body of literature as
25 far as I'm concerned.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. HAMDAN: Mike, a couple of questions
2 that Don raised, the three questions that there is,
3 why nobody is addressing it?

4 CHAIR RYAN: What three questions again,
5 I'm sorry?

6 MR. HAMDAN: The question he raised about
7 who would be effected and what --

8 CHAIR RYAN: Thursday.

9 MR. HAMDAN: What they will be effected
10 from and --

11 DR. COOL: We will talk about is more on
12 Thursday. Let me give you --

13 CHAIR RYAN: But the answer is, those are
14 very valid questions. I don't understand the basis
15 for it. I have yet to understand the basis for it and
16 I have not gotten a good answer from anybody either on
17 the committee or involved with ICRP to tell me what
18 the basis is.

19 DR. COOL: And I will not attempt to
20 either. I will note to you that what ICRP Committee
21 5 has been working on has been to try and develop a
22 framework with which to look at this one narrow
23 question within the context of everything you have to
24 look at from an environmental impact. When we do an
25 environmental impact assessment or appraisal for a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 facility, we just look at the wide range of impacts,
2 what's the impact of the concrete, what's the impact
3 of moving the dirt around.

4 One question relates to what might be the
5 impacts of the radiological effluents and that has to
6 be in the context of chemicals that are in the
7 environment and everything else. This can be viewed
8 as a small step in the process of helping to do that
9 in a more systematic fashion. I'm not sure how much
10 time we have on Thursday, but it's probably not
11 enough.

12 CHAIR RYAN: Fair enough. Allen?

13 VICE CHAIR CROFF: Regarding collective
14 dose, what does the report say about how to use or
15 whether to use collective dose in I'll call it cost
16 benefit analyses, like establishing the amount of
17 effluence you can release of a stack or something like
18 that? Does it get to that issue at all?

19 DR. COOL: What this report talks about is
20 in general terms the appropriate uses, which are to
21 compare options where you can define pretty clearly
22 the set of assumptions, most easily described in the
23 context of an occupational exposure. Do I do this
24 work in this particular way with that kind of
25 shielding and that respiratory equipment or do I use

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 a different kind of respiratory equipment? Which will
2 give me better protection, and you can compare the
3 dose to the group of workers doing it this way from
4 this way and make a decision about what would be
5 optimal.

6 Similarly, you could look at the various
7 kinds of effluent technologies that might be available
8 and understand what this technology costs and how much
9 it reduces it versus what this technology costs and
10 how much it reduces it. The context of using it for
11 comparing options is a correct use. What this
12 discourages is simply taking every bequerel that gets
13 out and integrating the dose that you would get from
14 every single bequerel to every single person that it
15 might come into and believing that the combination of
16 that multiplied by some risk coefficient, gives you a
17 meaningful number.

18 CHAIR RYAN: Well, it's the old example of
19 you don't want to compare a 100-mile an hour wind or
20 200-mile an hour wind for one hour and a two-mile an
21 hour wind for 100 hours. The same amount of air goes
22 by it.

23 DR. COOL: We also need to be careful
24 between stochastic effects and deterministic effects.

25 CHAIR RYAN: All of that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. COOL: So I just caution you on the
2 example.

3 VICE CHAIR CROFF: I'm mostly interested
4 in, I'll call it the public cost benefit as I've
5 labeled it here, in saying that there is an
6 appropriate use, do they give some guidance on how to
7 go about it? You know, I'm remembering in one other
8 ICRP report, they spoke to integrating over, you know,
9 homogenous population groups and this kind of thing.
10 Is any of that in this report?

11 DR. COOL: Some of that -- that material
12 is not in Publication 103. There is some of that
13 material and ways to look at the binning of various
14 aspects of the dose and decision making which is
15 actually part of Publication 101 related to
16 optimization which came out last summer.

17 VICE CHAIR CROFF: Okay, that's the one I
18 was thinking of.

19 DR. COOL: Yeah, that's the one you were
20 thinking of and that also publishes -- it's one-half
21 of Publication 101.

22 VICE CHAIR CROFF: Right, okay, thanks.

23 CHAIR RYAN: Ruth?

24 MEMBER WEINER: I'd like to take off from
25 what Allen has just been asking because you mentioned

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that there was something in this publication regarding
2 the use of collective dose in comparing alternatives.
3 Well, when you calculate collective dose, for example,
4 in transportation, the collective dose is heavily
5 dependent, in fact, completely dependent on the number
6 of people punitively effected.

7 This is -- transportation along a route is
8 a classic case of micro-doses to mega-populations.
9 Does the document say anything or do you have any
10 thoughts about when you get completely ridiculous
11 answers. If you get a large enough population, you
12 get a very large number of person-rem and even though
13 we hear every day that the -- you apply some kind of
14 conversion factor to this and the result is
15 meaningless, nevertheless, this communicates
16 something. Is there any advice in ICRP as to the
17 limits of the use of collective dose or are you going
18 to talk about this on Thursday?

19 DR. COOL: This is not a subject for
20 Thursday.

21 MEMBER WEINER: Okay.

22 DR. COOL: And the answer is there are no
23 quantitative suggestions for when it is or is not
24 appropriate. There is the qualitative statement that
25 it is inappropriate to use this complete integral of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 collective dose for epidemiological or health risk
2 purposes, but it does not give you any specific sort
3 of indication of what a small dose or otherwise might
4 be.

5 MEMBER WEINER: Has anyone ever brought to
6 the Committee this consideration that if you have --

7 CHAIR RYAN: Which commission?

8 MEMBER WEINER: Don's commission, thank
9 you -- the question if you have a large enough
10 population, you're going to get completely unrealistic
11 answers?

12 DR. COOL: This issue has been raised with
13 the ICRP on every single one of the comments that we
14 provided for them during this discussion process. We
15 asked them on each occasion to try and provide some
16 additional guidance which we could use that would help
17 us in regulatory decision making and otherwise.

18 It is not there. Whether it could be,
19 again, I suspect that this is probably one of those
20 questions where if we polled the group here, there's
21 probably 25 or 30 people in the room, you'd have N
22 plus 2 views on what the number might be and the
23 reason that they would pick it.

24 MEMBER WEINER: Let me ask you one final
25 question. Is there a way or anything that could be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 brought to the commission that would make -- that
2 would encourage them to come up with some kind of
3 quantitative recommendation as to the limits of the
4 use of collective dose?

5 DR. COOL: Well, that's an interesting
6 speculation. I'm not sure what circumstance might be
7 the sufficient threshold to get them to actually try
8 and write something like that down. I'll tell you
9 from my personal standpoint, a much more pragmatic
10 solution found within what they say in Publication
11 101, which is in the context of the decision-making,
12 setting aside your issue of doing a complete
13 calculation and using an number as a reference for
14 anything.

15 MEMBER WEINER: Right.

16 DR. COOL: But in the context of decision-
17 making, we then have the ability to look at the
18 various attributes and to apply constraints, if you
19 will, controls over those numbers so that the values
20 you're calculating help you to differentiate between
21 the options is one of the things which you're alluding
22 to, is that if you do the complete calculation and you
23 compare options, you see almost no difference because
24 it's being driven by the tail end, so it's not useful
25 in making the decision.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But if you change the way you do the
2 calculation, calculate it for a smaller distance or
3 different time intervals, you can get values which
4 will help you differentiate between the options. That
5 is an appropriate and very useful way to help make
6 decisions.

7 CHAIR RYAN: Now we're back to your worker
8 example.

9 DR. COOL: Exactly.

10 MEMBER WEINER: Yes.

11 CHAIR RYAN: You've got a case where A
12 versus B is a relative comparison of two, you know,
13 nearly equal things and I'm trying to see if there's
14 a difference.

15 DR. COOL: Right, right, that is the place
16 that they suggest is a very important and useful use
17 of collective dose, is and can and should be used in
18 those context to help you make those decisions.

19 CHAIR RYAN: And just for everybody's
20 benefit, our letters to the Commission on this topic
21 have said exactly that.

22 DR. COOL: Yeah, right.

23 CHAIR RYAN: Jim?

24 MEMBER CLARKE: Just a comment and maybe
25 you can get into this a little more on Thursday, but

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it strikes me that -- and believe me, I'm not
2 defending by any means the use of non-human end points
3 but it does strike me that if there are no limits
4 associated with these end points, then the dose
5 calculations could be used in a relative sense to
6 evaluate say, remedial alternatives and in an
7 ecological risk assessment. Alternative A gives this,
8 Alternative B gives this. Alternative A costs that,
9 and again, if you're not taking these calculations,
10 I'll say so seriously that you're establishing limits,
11 which would be something else, as is the case with
12 collective dose. Maybe it's a tool that could be used
13 to make relative judgments.

14 DR. COOL: I believe you're correct.

15 MEMBER CLARKE: And in that sense, I think
16 it might be useful.

17 CHAIR RYAN: I struggle with the relative
18 judgment because, again, without an end point, how are
19 you going to deal with two species as lethal doses I
20 order of magnitude or two orders of magnitude apart?
21 It doesn't make any sense. It's not consistent.

22 MEMBER CLARKE: I don't know. I don't
23 think I know enough about it to go that far.

24 CHAIR RYAN: Well, you know, I can tell
25 you that flies in East Tennessee take 10,000 rad shots

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and do just fine but if the temperature drops below 53
2 degrees, they die. That happens all the time.

3 MEMBER CLARKE: So, I'm not finding that
4 particularly useful but --

5 CHAIR RYAN: The point is, how do you get
6 to an end point?

7 MEMBER CLARKE: Yeah, well, I guess that's
8 the calculation.

9 CHAIR RYAN: So you regulate temperature
10 in that case instead of radiation.

11 MEMBER CLARKE: The same problem is true
12 with chemicals where you try to do an ecological risk
13 assessment, you don't know what end point to look at.
14 So it's really the same problem.

15 CHAIR RYAN: But I think that's the
16 analogy. It's not been possible to do it for a
17 chemical end point.

18 MEMBER CLARKE: Well, people do it, you
19 know, I question the value of it.

20 CHAIR RYAN: Yes, Thursday.

21 MEMBER CLARKE: But again, on a relative
22 standpoint is that there could be some merits --

23 CHAIR RYAN: And they would be?

24 MEMBER CLARKE: -- for what it's worth.

25 Well, I want to hear more from him.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIR RYAN: Anybody else? Okay, with
2 that we are a few minutes behind our appointed hour
3 for a short break. We'll come back in 15 minutes at
4 2:00 o'clock and pick up from there. Thank you.

5 (Whereupon, a short recess was taken.)

6 CHAIR RYAN: Okay, can I ask everybody to
7 take their seats. We'll reconvene, please. The next
8 presentation is the Corrosion of Waste Package and
9 Spent Fuel Dissolution in the Repository Environment
10 and Dr. Weiner will be our cognizant member for this
11 briefing. I would ask, we've had, I think, a number
12 of folks join us at the center and other participants
13 on the phone. So I would ask you -- at the center you
14 said you a large number of folks. Center?

15 MR. AXLER: Yeah, we have about 10 people
16 here.

17 CHAIR RYAN: Could I ask that instead of
18 trying to recite your names out that you make an
19 attendance list and fax it up here to the NRC?

20 MR. AXLER: Okay.

21 CHAIR RYAN: And apart from the center, do
22 we have --

23 MR. AXLER: Okay, we'll do that.

24 CHAIR RYAN: And your name is?

25 MR. AXLER: I'm Keith Axler, the Element

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Manager for Corrosion Science and Process Engineering.

2 CHAIR RYAN: Keith Axler, thank you very
3 much. We'll use your name as the lead and attach the
4 list that you fax up to the NRC office. We really
5 appreciate you doing that. It makes our record
6 complete and a little easier to manage.

7 Do we have any other participants not from
8 the center?

9 MR. DIBELLA: Yeah, this is Carl Dibella
10 at the TRB.

11 CHAIR RYAN: I'm sorry, Tobella?

12 MR. DIBELLA: Dibella.

13 CHAIR RYAN: Could you just get a little
14 bit further away from your phone.

15 MR. DIBELLA: Yeah, Carl Dibella.

16 CHAIR RYAN: Dibella, okay, thank you.

17 MR. FITZPATRICK: Charlie Fitzpatrick,
18 State of Nevada.

19 CHAIR RYAN: Anybody else? Thank you,
20 Charlie. Anybody else other than Charlie?

21 MR. FRISHMAN: Steve Frishman, State of
22 Nevada.

23 CHAIR RYAN: Thank you, Steve. Anybody
24 else? All right, I thank you very much for your
25 patience in taking the roll and I think we've got

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 everybody and I'd ask you to put your phones on mute
2 so that we don't hear the bumping and so for on the
3 microphones up here because is it quite loud. With
4 that, I'll turn it over to you, Ruth. Thank you.

5 MEMBER WEINER: Thank you. And we're very
6 gratified and pleased to have Tae Ahn once again and
7 Sheena Whaley is also here to answer our questions and
8 people at the Center, I leave it to between you and
9 whoever is coordinating, if it's a question that Tae
10 wants to have one of you answer, I'm sure he will say
11 so.

12 I will say in introducing this that the
13 committee had a number of questions about corrosion
14 after that last presentation that Tae made and time
15 did not permit us to get them all on the table, so we
16 submitted a list of questions and Tae, I want to
17 really congratulate you for the presentation because
18 he has put it together in answer to every one of our
19 questions. So carry on.

20 MR. AHN: Thank you very much, Dr. Weiner,
21 for you nice introduction. This presentation was
22 prepared by team member of Engineering Barrier System
23 in Post-Closure, ENG-1, Degradation of Engineer of the
24 Various Systems, ENG-3, Quantity and the Chemistry of
25 Water Contacting Engineering Barrier and the Waste

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Form, ENG-4, Radionuclide Leach and the Solubility
2 Limits, Division of High Level Waste Repository,
3 Safety with NRC and the CNWRA.

4 Dr. Weiner, gave us a general guide for
5 our presentation. The first one was the most
6 important considerations in any corrosion discussions
7 to the committee are what radionuclides at what
8 activity are released from the waste package and
9 second, how are they released? Those two are our
10 general guidances and the following questions were
11 directed towards these two considerations. We may not
12 present quantity release characteristic but in the end
13 we'll present risk perspective related to all
14 corrosion involved.

15 We'd like to address first to this
16 guidance examples of releases and release mode. What
17 is a potential release depends on physical state such
18 as power pallet or dissolved state, something like
19 that, and the chemistry, mainly radionuclide types of
20 spent nuclear fuel, radionuclide. First group is
21 rapid release of gap and the grain boundary
22 radionuclide inventory. After reactor discharge, some
23 radionuclides will be accumulated at the gap between
24 cladding and the UO_2 matrix, also grain boundaries
25 within the matrix of UO_2 . Such radionuclides include

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Carbon 14, Iodine 129, Cesium 135, and Technicum 99.

2 With the contact of water, these
3 radionuclides will be released rapidly. Therefore, in
4 performance estimate the release of radionuclides
5 assumes to occur instantly. The second group of
6 radionuclides include high solubility radionuclides
7 such as Iodine 129 and Technicum 99. These
8 radionuclides will dissolve in solution without any
9 limit. Therefore, release usually will be controlled
10 by spent nuclear fuel, U3O8 solution rate, that's rate
11 limiting step, not the solubility limit.

12 And these radionuclides generally
13 contribute to those in early period of time such as
14 sometimes 10,000 year period. And the third group of
15 radionuclide will be low solubility radionuclide
16 inventory, such as Neptunium 237, Plutonium 239-240
17 and Americium (phonetic) 241. These radionuclides
18 have very low solubility, therefore, release will be
19 controlled solubility times flow rate basically
20 solubility is concentration per unit volume. Flow
21 rate is volume per time. Therefore, the amount of
22 radionuclide release per time really calculated.

23 Not only solubility limit, sometimes these
24 radionuclides form solid particulate in suspensions.
25 That will increase the effective solubility limit

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 orders of magnitude. That is especially true for
2 plutonium and aminesium. Therefore, this character
3 will include solubility control to radionuclide as
4 well as colloidal forming radionuclides.

5 That explains the first questions of the
6 committee and the second, next step in assessing the
7 release, we need to consider then what would be a
8 potential release mode. We considered two release
9 mode. One is bacterial release. The other one is
10 diffusional release. They would depend on groundwater
11 flow rate, especially through perforations of cracks
12 of waste packets caused by corrossions. If you have
13 high flow rate, it's direct flow release large amount
14 of radionuclide.

15 On the other hand, if you have very
16 shallow tiny cracks or small pits, the release will
17 really depend on diffusion of the process of
18 radionuclide in the near static solution conditions.
19 Now, we are going to each questions. The first
20 question was, explain, using temperature as a time
21 surrogate and discuss the type of result the staff
22 expect. And there was some explanations.

23 It was mentioned during the September
24 briefing that one of the center's reports mentioned
25 using temperature as a time surrogate try to reproduce

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 what would happen at lower temperatures over longer
2 period of time by accelerating the process by heating.
3 Also staff indicated that this would be discussed
4 further during the TPA presentation but the subject
5 matter was not mentioned. Refer to ACNW Tuesday
6 September 18th, 2007.

7 I will go one by one. First, experiment
8 and temperature to simulate the long times, what I use
9 it for -- and I'll say corrosion and the extent you
10 pick your studies. In other words, with the value is
11 higher temperatures than expected repository
12 temperatures. So you use the real expected
13 temperatures in testing. The second one is
14 temperature could be used as a time surrogate as rate
15 of important chemical reactions increase, predictably
16 with time. A good example is Arrhenius relationship.
17 The premise of this theory is that the repository
18 temperature decreases very slowly compared with most
19 laboratory testing time. For instance, one-year
20 testing or one-month's laborative testing actually
21 repository temperature is nearly constant. Therefore,
22 we can use isothermal conditions to derive the generic
23 equations. Therefore, in each time interval you have
24 one constant temperature. If you add up all those
25 time steps, it will be time-scaled. That's why it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 isn't considered as temperature -- time surrogate.

2 Examples of those are kinetics derived at
3 temperature from 35 to 240 degrees C. In truth
4 kinetics of general corrosion rate, it's a long term
5 process of corrosion at the very low corrosion rate
6 and also localized corrosion criteria. Depending on
7 the temperature and the environmental chemistry,
8 corrosion, localized corrosion could often not occur.
9 It's all depending on temperature conditions and
10 chemistry.

11 Third category is kinetics of spent
12 nuclear dissolution. As I mentioned in earlier slide,
13 sometimes the solution rate itself controls release of
14 radionuclide if there is a high solubility limit.
15 That determination was used at different temperature
16 scale, again.

17 Second question was, explain how the
18 corrosion experiment at the center has been performing
19 since 2003 are going to be used first in the LA review
20 and B, in the PA. Use of CNWR information is to
21 assist the LA review and it will depend on what
22 information is provided in LA. Then I will say more
23 specifically how we could use our results. And
24 independent information could be used to assist LA
25 review. Independent information means center result

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 or other literature information, will be used in the
2 area such as data and model justification, data
3 uncertainty, model uncertainty and model support.

4 Topic, investigate an Alloy 22 since 2003
5 include a bunch of references were attached in the
6 end. The first copy is general corrosion, center and
7 we studied to determine general corrosion rate at
8 different temperatures, different time scale and the
9 stability of --

10 MEMBER WEINER: Excuse me, I'm going to
11 stop you a second. Did someone else just come on the
12 bridge line?

13 MALE PARTICIPANT: Yeah, my name is
14 (inaudible).

15 MEMBER WEINER: Sorry, go on.

16 MR. AHN: Upside stability as a protective
17 passive film and modeling and the second category is
18 seepage groundwater crevice corrosion. When
19 temperature comes below 110 degrees C, there will be
20 groundwater seepage onto a Waste Package. At that
21 time, temperature is still high. The concentration of
22 seepage water will be further concentrated like four
23 times, ten times. That may pose a low clad corrosion.
24 We studied effects such as the stifling of propagation
25 of crevice corrosion and crevice corrosion of similar

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and dissimilar metal such as Alloy 22 contacted with
2 titanium drip shield were studied.

3 And the third category is dust
4 deliquescence corrosion. If temperature is higher
5 than about 110 degrees C, we do expect the seepage
6 with contact. However, the dust may collect water
7 from the moist because some combinations of salt could
8 deliquescence even at high temperature of up to 200
9 degrees C. Therefore, we studied whether such
10 deliquescence corrosion could occur under such
11 combined salt conditions. What kind of corrosion
12 could occur were studied.

13 And stress corrosion cracking, mainly we
14 did more modeling based on previous data tested on the
15 various environmental conditions and temperatures.
16 Also stain rate was another factor to be considered
17 and based on the groundwater chemistry consideration,
18 some important risk information was given. I will go
19 over that later.

20 And microbially influenced corrosion was
21 continued by literature search. Even though we can
22 get some information from short-term testing, it is
23 very difficult to apply electrochemical technique in
24 predicting low crevice corrosion in this microbially
25 influenced corrosion because microbial reaction can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 not be detected by electrochemical process. So we did
2 some long-term testing there.

3 And the last is the effects of fabrication
4 process. In fabricating the waste it always create a
5 defect the way structure, etc. We studied how those
6 structure affect all these corrosion models.

7 And the number three question was what
8 results have been obtained from studies of passivation
9 and how do they apply to corrosion studies on the
10 waste package. Our responses should discuss the
11 experimental work shown with respect to formation and
12 the stability of passive film and the sources sulfur
13 in the repository that would enhance chemical
14 breakdown of passive film. Note that the passive
15 oxide film can be altered that may produce localized
16 destruction over the film. So question three is
17 application of waste package and the passivation
18 studies.

19 The first study was passive film
20 persistency. It is generally known chromium-rich
21 oxide protects the metal surface. Corrosion occurs by
22 this equilibrium between the metal and the solutions.
23 So it never had been in equilibrium with the
24 solutions. Always the driving force there. It
25 continues to dissolve.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 However, if you form oxide, in other
2 words, dissolved metal reaches solubility limit, it
3 will precipitate. That's a passive film. That's the
4 -- The reaction never stops. It dissolves, form,
5 passive film. It's the equilibrium process.
6 Therefore, to keep the passive film thin, about five
7 nanometers, is important. Oxide is surface dissolved.
8 Therefore, we keep a nearly constant oxide thickness.

9 It is very difficult to predict the
10 stability, persistence of passive film in such a long
11 period of time. Therefore, we attempted two areas.
12 One is thermodynamic analysis, in other words,
13 equilibrium study to assess the long-term stability.
14 The other one is analog consideration such as
15 Josephinite where iron and a silica oxide film was
16 observed very, very long time, 100,000 years.
17 Meteorite and nickel passive film was observed such a
18 long time. Also there are a lot of data in the
19 reactor operation, especially steam generator
20 materials. It's basically very close to Alloy 22,
21 Alloy 825, etc. Also it's higher temperatures. It's
22 more useful where we don't have much database. So we
23 put together all this information and put out as a
24 product document.

25 And the second, more specific issue in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 passive film persistence is the anodic sulfur
2 segregation. When the metal dissolves and oxide
3 forms, most metals dissolves. Chromium will form.
4 Oxide still dissolves. But somehow sulfur which is
5 not metal will stay there, remain at interface or on
6 the surface of the metal. It may at some point of
7 time destabilize the passive film. Unfortunately from
8 theoretical calculation such condition could occur
9 like over 100 years. So we cannot test it in the lab.

10 Therefore, we need to assimilate that.
11 How do we assimilate it? Two different ways you could
12 assimilate. One is you combat with sulfur to implant
13 the sulfur at interface to the amount you can expect
14 at 100 years. That's one thing you could do. It's
15 very difficult for there are a lot of artifacts could
16 be involved. Therefore, the central choice is the
17 electrochemical method. As the scratched metal was
18 exposed in sulfur containing solution like thiosulfate
19 or sulfide solution, Marcus of France has demonstrated
20 both effect the ion implantation as well as solution
21 containing testing have equivalent effect. There are
22 a number of papers on that. So we used that
23 condition.

24 And, in fact, sulfur impurity may be right
25 now up to 100 ppm in the current available alloy. But

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 a detrimental effect of sulfur segregation can be
2 reduced by reduction of initial sulfur content in
3 alloy like 1 ppm using a variety of different
4 processing techniques.

5 And the last one is the question of alpha
6 effect. In fact, this was a fact excluded some time
7 ago. So Dr. Weiner reminded us to revisit that,
8 review it again. We did that and recognized that the
9 effect of passivity appeared limited. That's the
10 answer to your question.

11 The reason is the following. No
12 significant source of alpha particles to contact the
13 passive film. Alpha particles inside the Waste
14 Package cannot penetrate through the Waste Package
15 under normal conditions and there is no other
16 significant source of external alpha particles.

17 The only possible alpha particle source is
18 from early-failed adjacent Waste Package. In other
19 words, when you have early Waste Package and something
20 coming out there, that could mitigate to the waste
21 impact and Waste Package. That's the only one you
22 could consider. It's very unlikely geometrically. It
23 could fall down. It will not go out. Also very small
24 amount like radon is the only gaseous one. It can go
25 out. But all radons are inside metrics. So really

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 coming out is --

2 Nevertheless, limited analysis currently
3 are being performed to support review of DOE's FEP
4 exclusions.

5 Now the number four question, it's pretty
6 long. Why do studies continue on dust deliquescence
7 especially since there is no impact? Also is the
8 staff making some assumptions that water would
9 actually be more likely in contact with the Waste
10 Package than with dust? Further, discuss the
11 experimental evidence that crevice corrosion by dust
12 deliquescence does not affect the Waste Package
13 performance.

14 There is a question. The stifling of
15 crevice corrosion is once you consider the relevance
16 of the statement, note that current information from
17 Center experiment indicates that crevice corrosion by
18 dust deliquescence does not affect a Waste Package
19 performance significantly. Staff's response in
20 September was not clear. Transcript from the meeting
21 state that. Actually, that's a good point. The
22 deliquescence will continue to this area. However,
23 the corrosion failure is from seepage water. That's
24 why we made this distinction. We'll go and continue
25 here. It will be terminated by seepage water. You

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 could assume several different assumptions of holding
2 of water either dust or on the metal.

3 Now I will go on by basis for dust
4 deliquescence corrosion. It's very unlikely.
5 Nevertheless, staff needs to review basis for
6 potentially included as well as excluded Features,
7 Events and Processes. This could be excluded FEPs for
8 study. That's your answer.

9 The second one is Alloy 22 corrosion
10 testing in salt brines (potentially composition of
11 dust deliquescence brines) shows that general
12 corrosion could occur, actually testing, not theory,
13 not modeling. It's actually testing with the
14 combination of three salts, sodium chloride, sodium
15 nitrate and potassium nitrate. That gives the
16 deliquescence at highest temperatures.

17 Also we can study the models for cathodic
18 capacity. In other words, if you have a limited
19 amount of water outside the crevice with dust deposit,
20 that may not give sufficient throwing power to induce
21 the corrosion. Therefore, we studies how much water
22 is needed. Actually, we saw there was some limited
23 capacity of a cathode to limit the corrosion inside
24 the crevice on the dust deliquescence conditions.

25 So both experimental modeling support,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it's very unlikely, low crevice corrosion is very
2 unlikely. However, we do observe the general
3 corrosion.

4 During the potential brine period, dust
5 will be present. Although corrosion by seepage
6 groundwater may dominate, dust deliquescence effects
7 on general corrosion contribute to variability and
8 uncertainty in PA. So we consider this deliquescence
9 period here in brine period, too. It will be
10 continued as I indicated in my previous presentation.

11 (Off the record comments.)

12 MR. AHN: Next two questions, it's related
13 to water flow and the dust again. I will read again.
14 Question five is what is the role of brine. What rate
15 of water flow would be needed to get to the brine
16 period.

17 NRC has done a great deal of work in the
18 formation of humidity, deliquescence and the corrosion
19 induced by deliquescence on the Waste Package surface.
20 The graph below shows to regions of potential
21 corrosion, dust deliquescence and the brine period.
22 However, a concentrated solution deliquescence on the
23 surface will have high surface tension and thus the
24 only minimal contact with the surface while the dilute
25 solution that can spread over the surface will be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 minimally corrosive. It would appear that there would
2 be little corrosion during either period. Defend the
3 statement made by staff at the September meeting,
4 "Dust may form brines for deliquescence at elevated
5 temperature and some deliquescence brine can induce
6 general or crevice corrosion." Note that concentrated
7 brine has high surface tension and stick to the dust.

8 And I'll go one by one. Corrosion during
9 dust deliquescent brine period, in the dust
10 deliquescent corrosion period, capillary retention of
11 dust deliquescence brines by rock may reduce the
12 amount of water that contacts a metal surface but does
13 not prevent corrosion from occurring though. That's
14 what we observed from tests.

15 In the brine period, temperatures appear
16 high enough to form concentrated brines. Usually to
17 initiate low crevice corrosion, you would have some
18 kind of a concentrated brine from seepage water, at
19 least, four times concentration. In addition, you
20 need to have high temperature, crevices, etc. So it's
21 not generally stated that what concentration could
22 cause a low crevice corrosion. However, very low
23 seepage case, you cannot form the sufficient amount to
24 cause like four times C-13 well water concentrations.
25 That's a distinction between dust deliquescence period

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and seepage groundwater period.

2 I will repeat once more. This is time
3 period of one million year temperature and the
4 relative humidity. We have a dry period here. It's
5 only dust that can absorb water and after that you
6 really will have seepage groundwater about several
7 thousand years later and the temperature will go down
8 continuously.

9 And the next question is stress corrosion
10 cracking. Question seven is what, if any, is the role
11 of stress corrosion cracking. How does experimental
12 work support this? The initiation of stress corrosion
13 cracking of Alloy 22 has been observed only in past
14 using either cyclic loading or constant straining with
15 high applied potentials. Low stress corrosion
16 cracking of Alloy 22 has been observed for constant
17 deflection conditions in simulated groundwater on
18 anodic and alkaline conditions. DOE indicated that
19 drip shield would be in place in stress mediated
20 conditions.

21 And Question number seven is about role of
22 stress corrosion cracking. Stress corrosion cracking
23 could have an effect by allowing a limited amount of
24 water into tight cracks in the Waste Package, not like
25 general corrosion. It's more like cracks. Very

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 limited water can get into Waste Package and the
2 radionuclides will get out in a very limited manner.

3 Formation of stress corrosion cracks
4 requires basically carbonate and bicarbonate solution.
5 That's why we only observe it at high potentials.
6 However, such concentration are not expected in the
7 repository. Therefore, the Center analysis support
8 that SCC is an unlikely process under potential
9 repository conditions.

10 Nevertheless, our TPA considered
11 uncertainties associated with SCC model abstractions.
12 So that's the current status.

13 Question eight is explained by what
14 chemical mechanism is the Waste Package destroyed.
15 How is this mechanism initiated? What conditions are
16 required to be maintained for this mechanism to
17 function? What is the degradation for rate for this
18 mechanism?

19 Initially, we wrote trying to answer all
20 these sub-questions, but recognized it's not
21 necessary. So we summarized. To destroy meant to us
22 to have large opening of Waste Package. So it's
23 separated general corrosion from the rest of the model
24 corrosion. The rest of the model corrosion generally
25 produced tight crack or a tiny pit. So it really

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 doesn't open the surface. On the other end, general
2 corrosion could open a larger surface area.

3 Compared with the other failure model of
4 the Waste Package, mechanical or any type, corrosion
5 mode is the likely process to penetrate through the
6 Waste Package and the general corrosion likely will
7 occur over a very long period of time because general
8 corrosion rates are very low.

9 General corrosion may eventually create
10 large enough opening in Waste Package to support
11 advective release. It will be a sufficient amount of
12 radionuclide.

13 How does it happen? It basically happens
14 by the loss of passivity. That's why we studied
15 persistence of passivity loss for enhanced general
16 corrosion. In other words, when you expose the metal
17 The solution rate will occur mainly higher. So
18 impurity segregation such as sulfur is a good example
19 to destabilize the passive films and there are other
20 issues. NTTIG collected that information years ago,
21 corrosion product accumulation, to induce larger
22 surface area of cathode or to alter the chemistry
23 adjacent to metals or you thicken the oxide film, you
24 could generate the stress there too. They can spall
25 off the film.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 However, current notion is outside the
2 layer is continuously dissolving and inside the layer
3 is continuously generating. They are probably the
4 constant thickness could be capped. Even if
5 generated, it becomes part of the outside and will not
6 contribute to the real corrosion rate. And basically,
7 long-term dissolution nor repassivation is the cause
8 of the opening at the surface area in a shorter period
9 of time.

10 And question nine is what are the sources
11 of nitrate in the repository. Explain how this has
12 been confirmed. EPRI studies appear to show that
13 nitrate solution inhibits localized corrosion.

14 There are two likely sources of nitrates
15 in the potential repository. Atmospheric aerosols
16 could be entrained in ventilation air and deposited
17 together with dust particles on the waste package
18 surface during the preclosure period. The soluble
19 fraction of atmospheric aerosols over continental
20 landmasses typically is dominated by nitrate, sulfate,
21 ammonium and sodium. Nitrate concentrations in
22 leachates of dust samples taken by the U.S. Geological
23 Survey from the Exploratory Studies Facility at Yucca
24 Mountain range from several tens to about 1800 ppm.

25 Now the second source is nitrate dissolved

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in groundwater. Nitrate concentrations reported by
2 the USGS for porewaters extracted from rock samples
3 taken from the unsaturated zone of Yucca Mountain and
4 the vicinity typically are in tens of ppm. Although
5 these porewaters are initially dilute, evaporation may
6 increase or decrease the concentrations of dissolved
7 constituents, including nitrate salts.

8 EPRI's studies appear to show the nitrate
9 solution inhibited by localized corrosion. Actually,
10 Center produced a similar behavior, similar effect of
11 nitrate on corrosion. This is the Y axis is the
12 repassivation potential. When corrosion potential
13 exceeds repassivation potential, localized corrosion,
14 crevice corrosion. Below that, localized corrosion
15 will not occur.

16 Now the higher the repassivation
17 potential, less susceptible to localized corrosion.
18 X axis is nitrate to chloride ratio. Nitrate is an
19 inhibitor to localized corrosion. Chloride is a
20 promoter of the localized corrosion. So if this ratio
21 is higher, the less susceptibility to the localized
22 corrosion. As you see here, if you increase the
23 ration, the repassivation potential increases
24 respectively from 0.1 to almost -- Corrosion potential
25 never reaches -- Therefore, localized corrosion would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 not occur.

2 This test was done Alloy 22 4 M Magnesium
3 Chloride solution, very concentrated solution at 80
4 degrees C and 110 degrees C. It's conforming the
5 EPRI's postulate.

6 And Question ten is now we're moving from
7 corrosion to spent fuel. Compare dissolution rates
8 for low burn-up and high burn-up fuel. Dissolution
9 studies need to get data on high burn-up fuel
10 characteristics, excess hydride, oxide fission product
11 and oxidation of high burn-up fuels.

12 The first question, available information
13 indicates that high burn-up spent fuel does not
14 increase the dissolution rate. Here you can see in
15 this rate milligram per cubic centimeter per day
16 versus burn-up up to 70 gigawatt day per metric ton
17 unit actually decreased here. This data is a
18 corroboration. It's a collective data and laid out in
19 one chart by Jain of the Center. You can see it's
20 decreased up to 70.

21 However, there are other factors we need
22 to consider in determining actual release. Some
23 physical steps could be changed, for instances, prior
24 dry oxidation from UO_2 to U-2308 could increase the
25 surface area substantially. That consequently

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 releases more radionuclide because this rate is a pore
2 unit surface area.

3 Second concern is hydride formation. That
4 could again not affect the dissolution rate itself but
5 potentially alter the surface area of the fuels. So
6 those too are a physical conditions, however, the
7 dissolution rate did not change.

8 The next question 11 is explain why the
9 results from the testing of SIMFUEL accepted the two
10 steps. SIMFUEL is a nonradioactive UO_2 -based fuel
11 containing simulated fission product such as barium,
12 etc., to use in laboratory. The Center still bases
13 its conclusion on experiments done with simulated fuel
14 with a stable isotope important fission product like
15 cesium. Simulated fuel behavior differs from SIMFUEL
16 primarily because it's opens and are not bound to the
17 uranium oxide in the same way that fission products
18 are bound. Moreover, the radiation damage done by
19 emission from oxidized spent fuel is not duplicated in
20 simulated fuel.

21 First, I would like to clarify after we
22 proposed this committee center only did modeling
23 literature analysis actually did not test any SIMFUEL.
24 The second one is the opened, you could have two
25 characteristics. One is the chemistry changes. The

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 other one is radiation effect.

2 As I see in the first bullet, dissolution
3 rates of spent fuel, unirradiated UO₂ and SIMFUEL are
4 undistinguishable in terms of the chemistry bound not
5 only formed as long as the environmental conditions
6 are very similar and the database listed --

7 CHAIR RYAN: Excuse me. Somebody doesn't
8 haven't their phone on mute and every time you move
9 it's creating a lot of noise. If you could all check
10 your phones to be on mute, we would appreciate it.

11 MR. AHN: NRC recently put out a report
12 here and the French have very expansive report.
13 Canadian, Spanish, these are all review reports. They
14 concluded the first --

15 MEMBER WEINER: Did someone else just sign
16 on to the bridge line?

17 CHAIR RYAN: Sorry. Go ahead.

18 CHAIR RYAN: He hung up. Somebody hung
19 up.

20 MEMBER WEINER: Hung up. Okay.

21 MR. AHN: There were no distinction
22 between those three fuels testing. And radiolysis,
23 however, effects on spent fuel dissolution may be
24 significant in reducing environments like in the
25 Swedish or German, Japanese. The potential Yucca

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 Mountain repository is oxidative, not reducing, with
2 abundant buffered oxygen available. Therefore,
3 radiolysis is anticipated to have a negligible effect
4 on an oxidized system. That's our observation and
5 analysis result.

6 However, there are some uncertainties
7 regarding the geometry of alpha particle emission as
8 you indicated after potential container failure. For
9 instances, all laboratory testing was done where it
10 defined amount of fuel, water, but in actual
11 repository you have bundles there. There could be
12 some geometric effect there. Most of those
13 overlapping radiation shield each other. There is
14 none basically, but still we want to be sure.

15 Question 12 is how long irradiated fuel
16 behavior on the repository conditions and over a long
17 period of time. How stable is the cladding? What is
18 the physical degradation rate of irradiated fuel in
19 intact Waste Package? What is the role of hydride in
20 fuel degradation? Should it be considered that the
21 Waste Package has undergone some corrosion and high
22 burn-up fuel effect?

23 I go one by one actually. Long-term
24 physical stability of irradiated UO2 matrix, other
25 than chemical degradation, in other words,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 dissolution, ongoing work in Europe especially the
2 European Commission, Karlsruhe Laboratory, ITU,
3 indicates that long-term stability of crystal
4 structure/integrity and stable radionuclide
5 distributions. They didn't see any significant
6 alteration at varying rates simulating a long period
7 of time.

8 Another physical degradation could come
9 from -- Physical degradation basically coming from
10 alpha displacement damage as you indicated. There are
11 other mechanisms such as mechanical failure, sometimes
12 assisted by chemical process such as hydration. For
13 instance, UO_2 could hydrate, just absorbing moisture
14 from environment. They could hydrate without
15 dissolution and become rapidly dissolved later with
16 water comes in. And hydrogen embrittlement in
17 cladding, you probably heard a lot from the SFST on
18 this issue.

19 And now moving to stability of cladding,
20 cladding could be subjected to either gross rupture,
21 you know, completely open up UO_2 or it just forms
22 perforations like small holes or tight cracks by
23 applied -- it's basically coming from given stress and
24 temperature needed. So these kinds of stability is
25 coming from, determined by applied stress, hydrogen

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 embrittlement or corrosion through time.

2 What is hydriding? Hydriding means the
3 zirconium could react with hydrogen in the cladding to
4 form zirconium-hydrogen hydride. That's very brittle.
5 Therefore, the mechanical -- this integration could
6 occur at much lower stress levels than normal yielded
7 stress or tensile stress. That's called hydrogen
8 embrittlement or if you have very small inside of the
9 crack, if hydriding occur, that could populate very
10 rapidly.

11 You normally after -- that could
12 discharge. The hydride is lying circumferentially.
13 Therefore, any hoop stress would not affect the
14 mechanical property. However, you have a temperature
15 or stress of uncertain level during the repository
16 performance, those circumferential hydride reorient to
17 other radially. Therefore, any hoop stress can cause
18 a crack propagation. That's the mechanism. The
19 radial hydride also could form by absorption at crack.
20 That's another stress because cracked you have usually
21 very stress levels. Those answer your four questions.

22 The last one is risk -- It's really tied
23 to the very first slide about radionuclide release for
24 all these processes. Provide risk insight regarding
25 how and any new thinking on corrosion influence the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 release of radioactive material from Waste Package
2 over time with the availability of transport into the
3 nuclear environment.

4 The fundamental risk insights, we prepared
5 in 2004, have not substantially changed in light of
6 new information and radionuclide release depends in
7 part on the extent of surface-area opening. I
8 emphasized a few times in the past slides. Small
9 surface area opening for groundwater entry into the
10 failed Waste Package or limited groundwater volume
11 restricts the mobilization of radionuclides inside
12 Waste Packages. Those two are a sense of the risk
13 determinations, risk assessment.

14 The expected extent of surface area-area
15 opening for various corrosion modes includes general
16 corrosion. Loss of passivity gives relatively large
17 opening and may lead to advective release. On the
18 other hand, crevice corrosion making a restricted
19 opening from susceptible water chemistry, tight
20 crevice area of buckled drip shield and Waste Package
21 and weld area. If you put it altogether, the
22 restricted area could open, may lead to only
23 diffusional or in some cases, you may have limited
24 advective release, too. SCCs, first of all, are
25 unlikely. But even if it happens, a very restricted

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 tight cracks and they may lead to only diffusional
2 release. New internals of Waste Package in tight
3 canister will reduce the colloidal release because
4 carbon steel is no longer used.

5 Now those are our risk insights I present.
6 I think during answering these questions I answered
7 your second questions, all of them. Okay.

8 Now one more thing I didn't address. The
9 stifling of crevice corrosion on the deliquescence
10 corrosion, we did not consider it because localized
11 corrosion did not occur in our observations. That's
12 all I have.

13 MEMBER WEINER: Thank you very much for a
14 really very thorough presentation and I'm going to
15 start the questioning off with Dr. Clarke.

16 MEMBER CLARKE: Thanks, Ruth. Let's just
17 leave that slide on. Your first bullet, fundamental
18 risk insights have not substantially changed in light
19 of new information, I guess the new information or the
20 studies you've done since the risk insights. At one
21 time I think we may have recommended that during the
22 TPA discussion that risk insights, in fact, be
23 revisited. When you make that statement, is that a
24 result of actually going back and looking at risk
25 insights, picking what you're learned and redoing --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. AHN: Yes.

2

3 MEMBER CLARKE: if you will, the risk
4 insights? In other words, this is stronger than just
5 kind of a feeling you have. This is the result of an
6 evaluation, that statement.

7 MR. AHN: Do you have any comment?

8 MR. McCARTIN: It's based on the --
9 obviously knowing what we had written before and
10 analyses we have done with the TPA code and looking at
11 the results. That's not to say we continue to do
12 analysis with the TPA code, but certainly in terms of
13 the results we're seeing it's consistent.

14 MEMBER CLARKE: Okay. And we've had
15 earlier presentations as you know about drift
16 degradation and we talked about that earlier today
17 among ourselves, I guess, in a letter writing. You're
18 looking at various corrosion mechanisms. I guess,
19 Tim, I'll ask you the same thing. Are these being
20 looked together at any point?

21 MR. AHN: Yes. I actually addressed, too.
22 Corrosion occurs because metal and solutions. It's
23 spontaneous reaction. You cannot stop it. However,
24 when metal arrives at the solubility limit, it
25 reprecipitate as an oxide. That's a passive film.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 That alternation process continues. It doesn't stop.

2 MEMBER CLARKE: I'm talking more about
3 rock fall damage, rock fall physical damage.

4 MR. AHN: Yes, rock fall could damage on
5 the seismic conditions the Waste Package. On the
6 other hand, the rock fall could push the Waste
7 Package, drip shield, onto Waste Packages and there
8 form crevice.

9 MEMBER CLARKE: Right.

10 MR. AHN: And under crevice conditions,
11 you really lose the passive film because of the
12 occluded area where pH is low. There is no oxygen.
13 You completely dissolve oxide protective layer.
14 Therefore, the propagation of the metal is very fast.

15 MEMBER CLARKE: I understand. The
16 question is that you are looking at this and the
17 performance assessment together.

18 MR. AHN: Yes.

19 MR. McCARTIN: Right, but if you're
20 reading that first bullet in which says "fundamental
21 risk insights have not substantially changed in light
22 of new information," that statement isn't being made
23 in a global sense for everything.

24 MEMBER CLARKE: No, I understand.

25 MR. McCARTIN: I mean it's relative to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 things below it, the same kind of things we're seeing,
2 and when we're doing our analyses we certainly are
3 looking at a spread of things that include rock fall.
4 But that's why I said this is true to the analyses
5 we've done to date. That's not to say we've done all
6 the things we're going to do and don't have further
7 things to learn. But for in this narrow area of
8 corrosion, this is.

9 MEMBER CLARKE: That was the way I
10 interpreted the sentence. The second question was
11 really a different questions. Okay. I think we're a
12 little pressed for time. I'll stop here.

13 Thanks, Ruth.

14 MEMBER WEINER: Mike.

15 CHAIR RYAN: No, I'm fine. You go ahead.

16 MEMBER WEINER: Allen.

17 VICE CHAIR CROFF: Thanks.

18 Early in the presentation you mentioned
19 rapid release of gap and grain boundary radionuclide
20 inventory which I understand up to a point at least.
21 It seems to me at some point after you start to
22 penetrate in the grain, doesn't the rate slow down and
23 it become limited by diffusion and matrix dissolution
24 because the water doesn't have, or the ground doesn't
25 have access.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. AHN: Yes. There was a conservatism
2 involved in the actual performance assessment. In
3 actual chemical phenomena, yes, it could be
4 diffusional release. There would be some time to
5 release completely the grain boundary in there.
6 However, the time scale of that release would be much
7 shorter than the repository time period. Therefore,
8 it would not be included in TPA model as a function of
9 time. It just happens.

10 VICE CHAIR CROFF: Okay. And is the
11 result of grain boundary, release at grain boundary,
12 does that disintegrate the fuel pellet?

13 MR. AHN: If there is a -- There was
14 actually data observed of about 25 grains penetrated
15 normally. So maybe less than one-tenth, it's not
16 much. But in actual release from metrics, it wouldn't
17 matter whether grain boundaries are partially
18 penetrated or not because the secondary phase masks
19 the whole surface. The actual contributing surface is
20 geometric surface. The other is of grain boundary
21 penetration. To some extent, yes, but not
22 substantially, people studied that. Yes.

23 VICE CHAIR CROFF: Okay. I'm on slide
24 four but one of your bullets mentioned temperature
25 being used as a time surrogate. Doesn't that use

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 assume that the mechanisms of degradation or corrosion
2 don't change?

3 MR. AHN: It will change. However, we use
4 the temperature range expected in the repository. We
5 test from like 25 degrees C all the way to 205 degrees
6 C. Even that kinds of changes we capture that.

7 VICE CHAIR CROFF: Okay. You talked about
8 sulfur and how it enhances corrosion. I was a little
9 bit unclear. Is the source of the sulfur in the metal
10 or is it in the groundwater?

11 MR. AHN: In the metal.

12 VICE CHAIR CROFF: It is in the metal.

13 MR. AHN: Yes, in the metal. I'm sorry.

14 VICE CHAIR CROFF: Okay. So I'm not quite
15 sure. How is testing with external solutions of
16 sulfides and thiosulfates relevant? Is there a
17 presumption -- Well, how is that relevant?

18 MR. AHN: There are a number of theories
19 mostly developed by Marcus in France. What he's
20 saying was they do a lot of a studies. Actually,
21 still we do them. No, it's only theory. It is sulfur
22 could be accumulated at the interface of metal and
23 oxide. But in reality, we cannot detect that. If you
24 probe with an analytical tool, you cannot probe the
25 interface alone. Usually it's a bigger area.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 So the more possible thing is sulfur could
2 be embedded even in passive film, too. That could
3 answer why you could simulate with solutions because
4 when you have solution, especially when you scratch
5 it, you expose purely metal sulfates. Then instantly
6 sulfur could be absorbed on the bare metal surface,
7 the inner passivate. Therefore, sulfur could be
8 implanted much deeper even from the solutions. But
9 that's one region.

10 VICE CHAIR CROFF: Okay, but all the
11 sulfur driven corrosion is theory.

12 MR. AHN: We extracted it. Yes, but we
13 extracted it. For instances, we scratched the sulfur
14 containing solution. We took our sample in solution
15 without sulfur and see the behavior. Yes, we have
16 separate techniques to extract the continuous solution
17 effect from the real metal surface effect.

18 VICE CHAIR CROFF: And you have observed
19 accelerated corrosion?

20 MR. AHN: Yes.

21 VICE CHAIR CROFF: Okay.

22 MR. AHN: It's about not significant --

23 VICE CHAIR CROFF: On the nitrates, I'm
24 looking at your graphic, the graph that shows the
25 change in potential, and if I'm reading this right, up

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 near 600 millivolts I'm seeing a scatter of symbols,
2 some of which indicate no crevice corrosion and some
3 say there is crevice corrosion at the same point. How
4 can you draw any conclusion from this?

5 MR. AHN: Yes, crevice corrosion is the
6 black one. No crevice corrosion is the white one.
7 It's different temperature. This is one example.
8 General trend you have more crevice corrosion in the
9 lower end side. That's what I have seen. That's why
10 we draw this line here, this trend.

11 VICE CHAIR CROFF: Granted there is more
12 lower --

13 MR. AHN: It's a trend, yes.

14 VICE CHAIR CROFF: It doesn't look to be
15 a very powerful trend, is it?

16 MR. AHN: There are better figures, better
17 data. I'm sorry. I should have taken that, but I
18 thought this was direct comparison. So I took it.
19 But there was general -- The trend is more crevice
20 corrosion. I think there are better. But general
21 trend is in this straight lines here.

22 VICE CHAIR CROFF: Okay. Finally, on the
23 radiolysis effects in looking at the view graph, I see
24 a lot of data supporting that the dissolution rate of
25 spent fuel and SIMFUEL is about the same. But on the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 next bullet, the radiolysis effects, is it known that
2 there is no effect of radiolysis in an oxidizing
3 system or is this --

4 MR. AHN: Yes. I give you one -- That's
5 why last bullet I said uncertainties. One case they
6 observed in oxidized solution they added strong
7 radiation. Then what happened is H₂O₂ formed was not
8 unstable. It was stable there and it really
9 accelerated.

10 Such a condition could occur. The French
11 did the testing using the various strong alpha
12 radiation in oxygenated solution and so increased the
13 solution rate. They varied the alpha radiation field
14 because in the actual bundle of fuels, all alphas are
15 shielded. It doesn't linearly add it together. So
16 the strong radiation they used was just adding up all
17 those alpha radiation from single rods linearly.
18 That's not realistic at all. So there was one case,
19 yes, we had.

20 VICE CHAIR CROFF: A couple of questions
21 on the conditions. Have they looked at the effects of
22 beta and gamma radiation or neutrons?

23 MR. AHN: Yes, they all come together.
24 Alpha and gamma is more similar. Beta is less
25 pronounced. All data coming together, yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 VICE CHAIR CROFF: And the solutions
2 they've used here have the other miscellaneous
3 chemicals in them than the groundwater would?

4 MR. AHN: Yes, it's most groundwater
5 containing a carbonate, chloride. Carbonate is a key
6 issue in the water and silica and some other
7 contaminants, yes.

8 VICE CHAIR CROFF: Okay. Thanks.

9 MEMBER WEINER: Bill?

10 MEMBER HINZE: Just a very few questions
11 of a general nature. Your presentation is excellent.
12 You also -- One of the things you come away with from
13 your discussion is there are uncertainties in the
14 corrosion of the Waste Packages in the dissolution of
15 the spent nuclear fuel over time. If number one was
16 very low uncertainty and number ten was high
17 uncertainty, how would you expect the uncertainty in
18 your knowledge of this dissolution and corrosion to
19 change? How would you expect the uncertainty to
20 change from the closure of the repository to a million
21 years?

22 MR. AHN: We use --

23 MEMBER HINZE: And my next question, of
24 course, as you think about the answer to that is why.

25 MR. AHN: That's why we use analog such as

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 passivity. I'm not sure it would really change much
2 based on that observation of analog materials. The
3 notion we have since they're applied to analog
4 materials, too, it really depends on environmental
5 conditions rather than materials.

6 MEMBER HINZE: Are you talking
7 particularly about meteorites?

8 MR. AHN: Josephinite force.

9 MEMBER HINZE: I'm sorry.

10 MR. AHN: Josephinite and the meteorites.
11 Those are examples. Passivity, it's different passive
12 film like oxide silica or oxide. It's still there.
13 That's what we are talking to.

14 Tim?

15 MR. McCARTIN: I guess one way to answer
16 Dr. Hinze's question is also in terms of temperature
17 and the uncertainty, certainly if you go out over the
18 million years, there's a big difference in the
19 temperatures you see and I guess that might be one
20 possible way. How does the uncertainty vary with
21 time, but really because of the temperature and I
22 don't know.

23 MR. AHN: Yes. That reduces the
24 uncertainty, too. It's dust deliquescence, local
25 corrosion, all those things. That's why I'm saying

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 more passivity issue in the longer period. That's the
2 only remaining issues because solutions are --

3 MEMBER HINZE: Are you saying -- Excuse
4 me, but are you saying the uncertainty is higher
5 during the thermal maximum period?

6 MR. AHN: Yes. It's --

7 MEMBER HINZE: Let me ask. I don't want
8 to dwell on this. Let me ask a related question. The
9 EPA draft standard suggests that infiltration at the
10 repository level be used as a surrogate for the
11 climate change. That's simplification of a complex
12 process, but basically a change in the infiltration at
13 the repository. In your analyses, have you considered
14 changes in surface conditions which may also be
15 affected by the climate change, for example, the
16 development of organic material at the surface causing
17 complexing, causing microbial activity to be
18 accelerated which may lead then to conditions not only
19 of a change in increase in the infiltration at the
20 repository level but a change in the chemical and
21 biological activity within the infiltrating water and
22 also the possibility that we may have a ashfall, not
23 necessarily a volcano in the exact vicinity of Yucca
24 Mountain, but we may have it in the region leading to
25 an ashfall and the effect of the ashfall changes the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 surface conditions and the solutes that are available?

2 MR. AHN: Actually, we studied even before
3 the effect of organics like oxide acid and the effects
4 on corrosion. Exact assessment, a more accurate
5 assessment, based on environmental conditions were not
6 done. However, we have some database at different
7 oxidic conditions, what effect could occur and the
8 corrosion performance, yes.

9 MEMBER HINZE: So your range of --

10 MR. AHN: Yes, the range of conditions.

11 MEMBER HINZE: The range of distribution
12 incorporates these kinds of -- like enhanced microbial
13 activity, etc.

14 MR. AHN: Yes. Exactly.

15 MEMBER HINZE: Thank you very much.

16 MEMBER WEINER: Jim, you had further
17 questions.

18 MEMBER CLARKE: No. Thanks.

19 MEMBER WEINER: I have just a general
20 question and most of our questions really you have
21 addressed them and addressed them very thoroughly.
22 Since a great many of the mechanisms that you've
23 studied really have minor to no influence on
24 corrosion, in other words, you have to have cracks in
25 order to initiate the corrosion, you have to do all

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrross.com

1 those things, what is the primary mechanism by which
2 the Waste Packages would corrode enough to release
3 spent fuel elements into the groundwater if that
4 happens or is this a combination of mechanisms? Does
5 it change over time?

6 MR. AHN: I said, I presented, a few
7 times. It's general corrosion. That's the most risk
8 significant corrosion mode because it could open up
9 the area and really penetrate through opening up to
10 release radionuclide in the walls.

11 MEMBER WEINER: And the rate, you would
12 assume that the rate of general corrosion would be
13 enough to penetrate all of the -- Are you going to
14 corrode all of the Waste Packages? Some of them?
15 Over what period of time would that corrosion
16 penetrate the Waste Package and then the TAD, assuming
17 you have a TAD which we are assuming and then the
18 cladding because you have to get through all those to
19 get to the spent fuel and then dissolve -- Well, then
20 you would release what it would be in the gap I would
21 assume.

22 MR. AHN: Right.

23 MEMBER WEINER: And are you also assuming
24 dissolution of the uranium dioxide matrix?

25 MR. AHN: In terms of corrosion of Waste

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Package, it would last based on current general
2 corrosion rate, hundreds of thousands of years. It's
3 a long period of time unless you have some other
4 mechanisms such rock fall or seismic effect. That may
5 cause less restricted small openings, whereas general
6 corrosion would occur in very long periods of time and
7 dissolution would take another -- it's shorter than
8 the Waste Package lifetime.

9 But right now, we have not seen -- We
10 don't know whether the cladding is a credit, too, or
11 not. Sometimes like TAD canister or there is a inner
12 Waste Package that are not still not credited actually
13 in the release calculations. We are assuming that
14 there is none.

15 And the cladding, too, right now we don't
16 know whether cladding is credited or not. And,
17 however, there is one exception though initially
18 failed the container, less than one container that is
19 opened up from the beginning.

20 MEMBER WEINER: Actually, this question
21 might be addressed to Tim. Do you have any
22 realizations where you assume different rates,
23 different amounts, of corrosion? In different rates,
24 do you include? Do you routinely take no credit for
25 inner canisters and so on?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. McCARTIN: In our current approach as
2 Tae indicated, the general corrosion appears to be the
3 process for very long term and that can open up holes
4 of some size. The corrosion rate is varied. The
5 extent of the openings and how much water they let in
6 can be varied in the code. The same is true for the
7 Department. It obviously is not one corrosion rate,
8 but it's a range and how much water. I mean all of
9 that stochastically varied.

10 But in general -- And I think from our
11 viewpoint it's I think regardless of what we have in
12 our code which is what we're using to help us assist
13 our review, I think the important thing that we've
14 learned through a lot of the tests that Tae and people
15 at the center have done is that general corrosion
16 appears to be a process that needs to be considered.
17 I don't think we have any firm belief whether it's
18 going to end up with a lot of packages failing early,
19 or I shouldn't say early, but in the hundred thousands
20 of years or is it in the million years? That we're
21 not saying. I think what we're saying is that it's a
22 process that needs to be considered and certainly
23 you're right. There's a lot of variability in how
24 that might end up.

25 MEMBER WEINER: I have one final question.

1 Since the question has been brought up twice today
2 that rock fall damaging the drip shield could crush
3 the drip shield to the point where it damages the
4 waste -- where there would be an impact on the Waste
5 Package, what if you didn't have a drip shield? Could
6 you reduce the probability of that damage? Is that a
7 scenario to consider?

8 MR. AHN: Actually, DOE changed the design
9 a few times by enforcing the drip shield using the
10 structural titanium 29. Originally it used only
11 seven. It's more ductile. Then they reinforced it
12 with 29. The design changed a few times to answer
13 your question.

14 MEMBER WEINER: Any of the staff have --
15 Chris.

16 MR. BROWN: Chris Brown from the Staff.
17 Tae, would you tell me if the staff plans on producing
18 any new regs on these two subjects? If so, when?

19 MR. AHN: When the spend fuel dissolution
20 report is out in ADAMS. It's not printed in NUREG or
21 any form of report or paper but just NRC report in
22 ADAMS you can get it.

23 MEMBER WEINER: Other questions? Latif.

24 MR. HAMDAN: Yes. Tae, do you have a
25 process model for corrosion --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. AHN: Yes.

2 MR. HAMDAN: -- that's separate from TPA?
3 Right?

4 MR. AHN: Well, it's abstracted. Yes.

5 MR. HAMDAN: I understand. So can you
6 give us because some of us either do not know how many
7 variables do you have in that model?

8 MR. AHN: What do you mean? In corrosion?

9 MR. HAMDAN: Yes.

10 MR. AHN: It's --

11 MR. HAMDAN: Roughly. I mean I'm just
12 curious.

13 MR. AHN: How many parameters?

14 MR. HAMDAN: Variables. Yes, how many
15 input parameters or entries do you have?

16 MR. AHN: At least, 30 to 50 and even
17 higher.

18 MR. HAMDAN: Okay. These 30/50
19 parameters, what are the sources of these data that
20 was used as input data whether these now or over time?
21 You know, you have this by the Center. You have --
22 Where did you get your information about your input
23 data from?

24 MR. AHN: From testing. It's like a
25 repassivation. This is in the code. When we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 calculate the corrosion separately and we give this
2 repassivation potential at the given temperature, at
3 the given chemistry, that's from environmental
4 conditions at a given time.

5 MR. HAMDAN: Right. But --

6 MR. AHN: Then you compare that there.

7 MR. HAMDAN: Okay, but where did you get
8 the data for this location, for this time. You see
9 the humidity is this much or the temperature is this
10 much. Where did you get that?

11 MR. AHN: That's from USI and another ISI.

12 MR. HAMDAN: Okay. So this seems to be at
13 this box --

14 MR. HILL: Britt Hill, NRC staff. The
15 source of the data that we're using in the TPA Code is
16 documented in the TPA Users Guide. So every one of
17 the parameters, the data source for that information
18 is well documented. It's difficult to give a single
19 source, but it's very easy to say we've considered a
20 broad range of information that's available from the
21 open literature, experiments that we've sponsored at
22 the CNWRA, in addition to work that the Department of
23 Energy has done.

24 MR. HAMDAN: And that was, I know
25 something about the TPA, but that goes also to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 corrosion process model as well.

2 MR. HILL: In terms of the general
3 understanding that our staff will use to review the
4 Department's License Application, we are considering
5 a very broad range of available information. We're
6 going to be relying primarily on the information that
7 the Department presents in its License Application.
8 But we will be considering information from all other
9 relevant sources including work that's been conducted
10 at Center and work that's in the open literature.

11 MR. HAMDAN: I understand that, but you
12 are running a process model right now with --

13 CHAIR RYAN: Latif, I'm sorry. I don't
14 understand your question. Is this something that you
15 can discuss offline?

16 MR. HAMDAN: Yes.

17 MEMBER WEINER: Yes.

18 CHAIR RYAN: All right.

19 MEMBER WEINER: I think we can close this
20 up and thank you again very much and I wanted to thank
21 the people at the Center for their support and I'll
22 turn it back over to the Chair.

23 CHAIR RYAN: Thanks. We're a little bit
24 ahead of time and I'm glad we've finished the subject,
25 Tae. Thank you so much for your time and all your

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 preparation. We know you worked hard to answer our
2 questions which were many. So thank you very much and
3 thank you to everybody else that helped with today's
4 briefing. It's been very informative.

5 With that, why don't we take a very short
6 ten minute break and then we'll get back to Professor
7 Hinze's letter and we'll go from there. Thanks. Off
8 the record.

CERTIFICATE

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission in the matter of:

Name of Proceeding: Advisory Committee on
Nuclear Waste & Materials
186th Meeting
Docket Number: n/a
Location: Rockville, MD

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and, thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.

Charles Morrison

February 12, 2008

Dr. Donald A. Cool

Senior Advisor

Public Policy and International Liaison

Waste and Environmental Management Programs

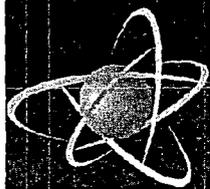

U.S. NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

Publication

- ICRP Publication 103 was made available to NRC staff on December 18, 2007.
- Report is 332 pages in length, including appendices.

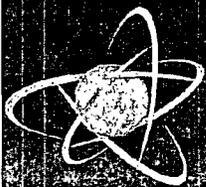

U.S.NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

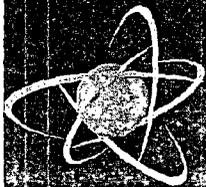

Table of Contents

- Introduction
- The Aims and Scope of the Recommendations
- Biological Aspects of Radiological Protection
- Quantities Used in Radiological Protection
- The System of Radiological Protection
- Implementation of the Commission's Recommendations
- Medical Exposure of Patients, Comforters and Carers, and Volunteers in Biomedical Research
- Protection of the Environment
- A: Health Risk Attributable to Ionizing Radiation
- B: Quantities used in Radiological Protection

Main Features

- Updated radiation and tissue weighting factors.
- Maintained the three fundamental principles.
- Evolved to situation-based approach.
- Maintained individual dose limits for planned exposure situations.
- Reinforced optimization with emphasis on constraints.
- Included approach for developing a framework for protection of the environment.

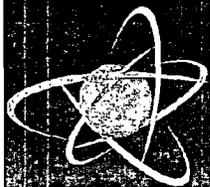

U.S.NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Impact of NRC Comments

- Many NRC editorial and specific comments contributed to significant improvements in text.
- Further clarifications of constraints, and their use.
- Stated that collective dose should not be used for risk assessment, but did not provide quantitative guidance.

U.S. NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

Impact of NRC Comments

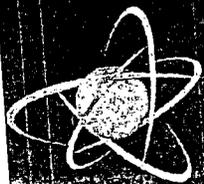

- Continued to rely on unpublished or non-publicly available material.

- Continued with tissue weighting factors for 13 tissues within the "remainder".

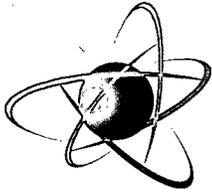

- Included chapter on protection of the environment.

~~NRC Staff Next Steps~~

- ~~Initiation of staff work to prepare options for Commission consideration.~~
 - ~~Considerations go well beyond 10 CFR Part 20.~~
 - ~~Changes do not directly increase adequate protection or safety.~~
 - ~~Other rationale, such as updating scientific information and achieving consistency of~~
- ~~each.~~
- ~~to Commission in December 2008.~~

Advisory Committee on Nuclear Waste and Materials (ACNW&M) Questions on Corrosion of the Waste Package and Spent Nuclear Fuel Dissolution

**In Response to Staff Presentations to ACNW&M in 182nd Meeting,
September 18 – 20, 2007**

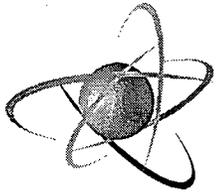

**Presented by T. Ahn of NRC and prepared by team members of
engineered barrier system in post-closure, ENG 1, ENG 3 and ENG 4
of Division of High-Level Waste Repository Safety of NRC and
Center for Nuclear Waste Regulatory Analyses (CNWRA)**

**186th Meeting of the ACNW&M, February 12 – 14, 2008
U.S. Nuclear Regulatory Commission, Rockville, MD**

ACNW&M General Comment

“The most important considerations in any corrosion discussions to the Committee are: (1) what radionuclides (at what activity) are released from the Waste Package (WP), and (2) how are they released. The following questions are directed towards these considerations.”

U.S. NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Examples of Releases and Release Modes

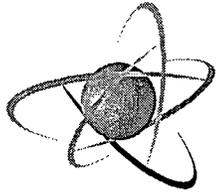

- What is potentially released depends on physical state and chemistry of spent nuclear fuel (SNF) radionuclides:
 - Rapid release of gap and grain boundary radionuclide inventory, such as C-14, I-129, Cs-135, and Tc-99.
 - High solubility radionuclide inventory, such as I-129 and Tc-99 (release controlled by SNF dissolution rate).
 - Low solubility radionuclide inventory, such as Np-237, Pu-(239-240), and Am-241 (release controlled by solubility limit or colloids).

- Potential release modes:
 - Advective or diffusional, depending on groundwater flow rates through perforations or cracks of the WP caused by corrosion
 - Advective or diffusional release is also in series with SNF dissolution rate or radionuclide solubility limit (or colloids).

Question (Q) 1: Use of Temperature as a Time Surrogate

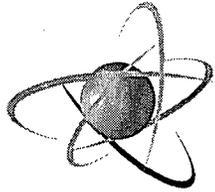

- Experiments at temperature to simulate long times were not used for NRC corrosion and SNF studies.
- Temperature could be used as a time surrogate, as rates of important chemical reactions increase predictably with temperature (e.g., Arrhenius relationship).
- Range of calculated repository temperatures, ~ 35 – 240 °C (~ 95 – 464 °F), used in experiments for
 - Kinetics of general corrosion
 - Localized corrosion criteria
 - Kinetics of SNF dissolution

U.S.NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Q 2: Potential Staff Use of Corrosion Experiments Conducted since 2003 in License Application (LA) Review and Performance Assessment (PA)

- Use of CNWRA information to assist LA review depends on what information is provided in LA.
- Independent information could be used to assist LA review for areas such as:
 - Data and model justification
 - Data uncertainty
 - Model uncertainty
 - Model support
- Topics investigated on Alloy 22, since 2003, include (references in the end):
 - General corrosion
 - Seepage groundwater crevice corrosion
 - Dust deliquescence corrosion
 - Stress Corrosion Cracking (SCC)
 - Microbially influenced corrosion
 - Effects of fabrication processes

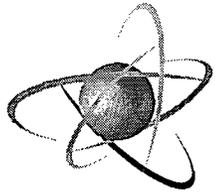

U.S. NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Q 3: Application of WP Passivation Studies

- **Passive film persistence** – Chromium-rich oxide film results in low general corrosion rates.
 - Thermodynamic analyses used to assess long-term stability of passive film (Jung, et al, 2007; Mintz, et al, 2007).
 - Analogs: Josephinite, meteorite, and reactor steam generator materials were assessed to understand long-term passivity (Jung, et al, 2007; Ahn, et al., 2007).

- **Anodic sulfur segregation** – Although sulfur may remain on the surface during corrosion and destabilize passive film, molybdenum may dissolve sulfur and chromium promotes repassivation.
 - Scratched metal exposed to solutions containing sulfides or thiosulfates may experience sulfur-enhanced general corrosion (i.e., Jung, et al, 2007; Ahn, et al., 2007).
 - Sulfur impurity may be up to 100 ppm. Detrimental effects of sulfur segregation can be reduced by reduction of initial sulfur content in the alloy (e.g., 1 ppm) (Jung, et al, 2007; Ahn, et al., 2007).

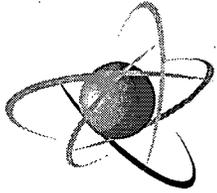

- **Alpha radiation effects** – Effects on passivity appear limited.
 - No significant source of alpha particles to contact the passive film. Alpha particles inside WP cannot penetrate through the WP under nominal conditions, and there is no other significant source of external alpha-particles.
 - Possible alpha particle source is from early-failed adjacent WP, or from portion of adjacent WPs subjected to corrosion or mechanical failure. Unlikely geometry is required for possible effect.
 - Limited analyses are being performed, to support review of DOE's Features, Events, and Processes (FEPs).

U.S.NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Q 4: Basis for Dust Deliquescence Corrosion

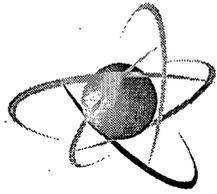

- Staff needs to review basis for potentially included and excluded FEPs.
- Alloy 22 corrosion testing in salt brines (potential composition of dust deliquescence brines) shows that general corrosion could occur (Yang, et al., 2007). Models of cathodic capacity of Alloy 22 in dust deliquescence brines (Shukla, et al. 2007) support the experimental observations.
- During the potential brine period, dust will be present. Although corrosion by seepage groundwater may dominate, dust deliquescence effects on general corrosion contribute to variability and uncertainty in PA.

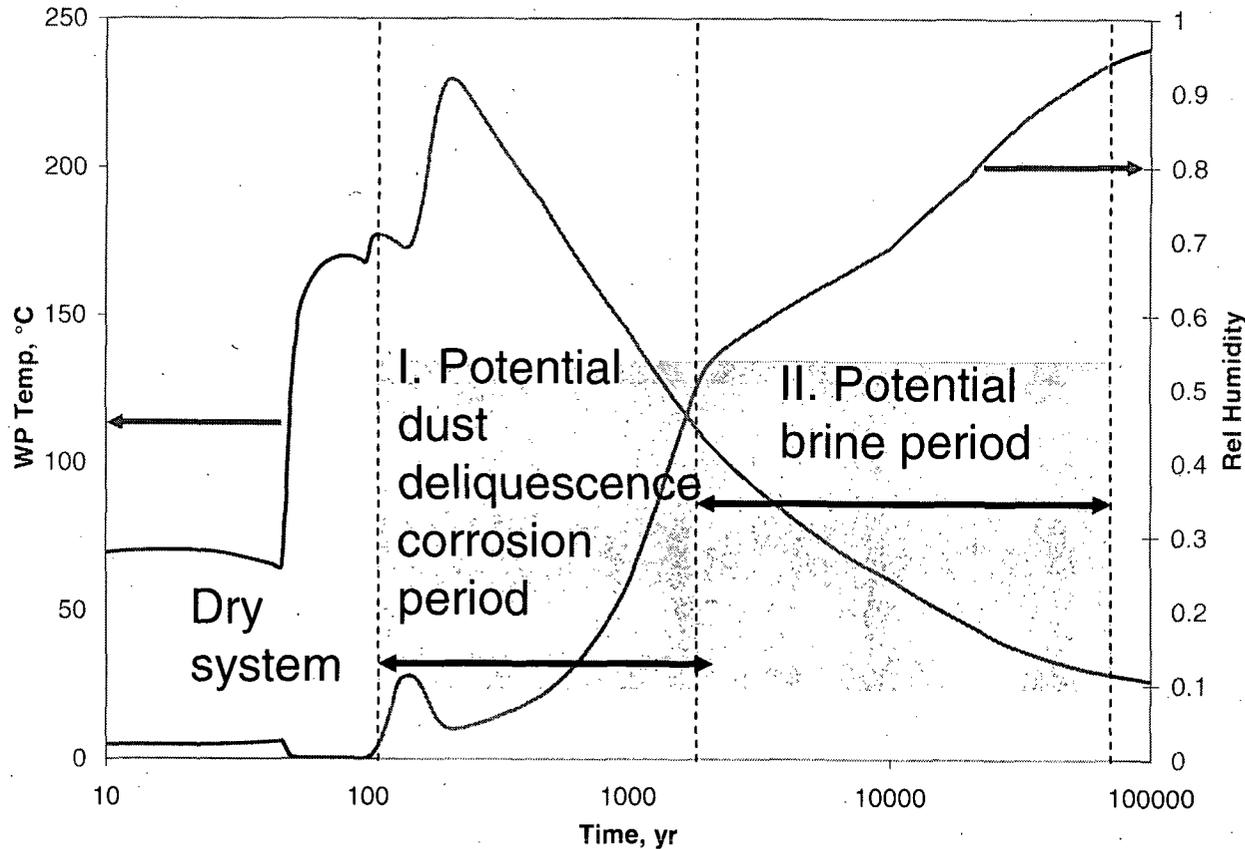

U.S. NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Q 5 and 6: Corrosion During Dust Deliquescence and Brine Periods

- In the dust deliquescence corrosion period capillary retention of dust deliquescence brines by rock dust may reduce the amount of brine that contacts a metal surface, but does not prevent corrosion from occurring (He, et al., 2007).
- In the brine period, temperatures appear high enough to form concentrated brines that may cause crevice corrosion. Simultaneously, general corrosion continues. General corrosion rates are generally insensitive to brine concentrations.

WP Environment and Corrosion Modes

(After Pensado, 2006)

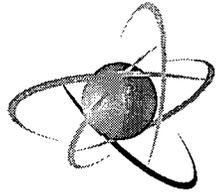

- Persistence of long-term passive film in general corrosion (I, II, and longer period)
- Dust deliquescence corrosion (I)
- Seepage water brines - crevice corrosion (II)

(100 °C = 212 °F)

Q 7: Role of Stress Corrosion Cracking

- SCC could potentially have an effect by allowing a limited amount of water into tight cracks in the WP.
- Formation of SCC requires carbonate/bicarbonate solution concentrations that are not expected in the potential repository (e.g., Chiang, et al., 2007). CNWRA analysis supports that SCC is an unlikely process (e.g., Chiang, et al, 2007).
- Uncertainties associated with SCC model abstraction are considered in TPA (Leslie and Grossman, 2007).

U.S.NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Q 8: Chemical Mechanisms for WP and DS Corrosion.

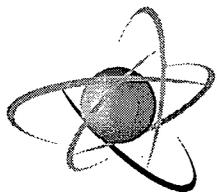

- Corrosion most is the likely process to penetrate the WP.
- General corrosion likely will occur over a longtime.
- General corrosion may eventually create large enough opening in WP to support advective release.
- Passivity loss for enhanced general corrosion:
 - Impurity segregation (e.g. sulfur), corrosion product accumulation, or stress developed
 - Long-term dissolution and no repassivation

Q 9: Nitrates in the Repository

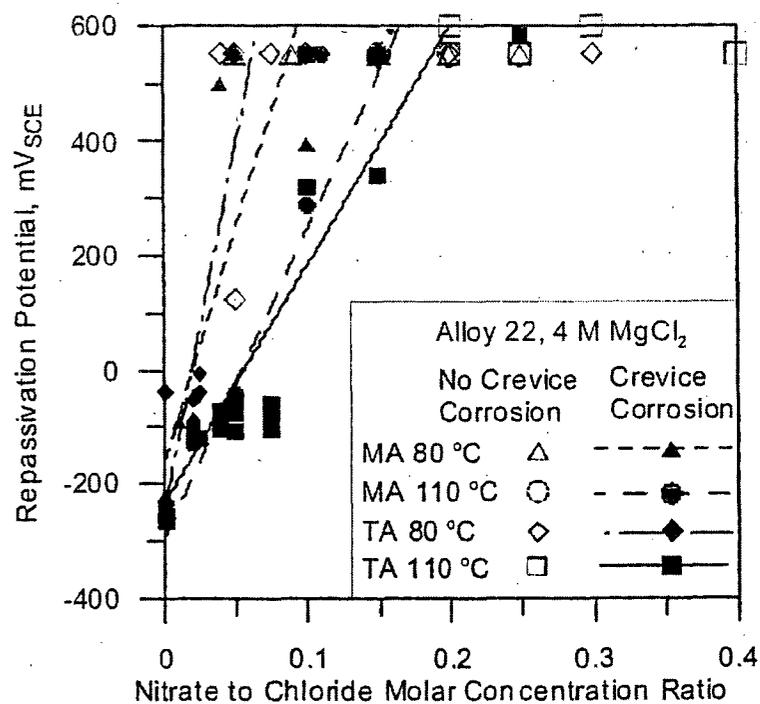

There are two likely sources of nitrates in the potential repository:

- Atmospheric aerosols could be entrained in ventilation air and deposited, together with dust particles, on the waste package surface during the preclosure period.
 - The soluble fraction of atmospheric aerosols over continental landmasses typically is dominated by nitrate, sulfate, ammonium, and sodium (e.g., Seinfeld, 1986).
 - Nitrate concentrations in leachates of dust samples taken by the U.S. Geological Survey from the Exploratory Studies Facility at Yucca Mountain range from several tens to about 1800 ppm (Bechtel SAIC Company, LLC, 2004).
- Nitrate dissolved in groundwater.
 - Nitrate concentrations reported by the U.S. Geological Survey (Yang, et al., 1996, 1998, 2003) for porewaters extracted from rock samples taken from the unsaturated zone of YM and vicinity typically are in the tens of ppm.
 - Although these porewaters are initially dilute, evaporation may increase or decrease the concentrations of dissolved constituents, including nitrate salts.

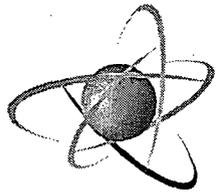

Q 9: Nitrates in the Repository (Cont.)

E_{repass} vs. NO_3 (Dunn, et al, 2005)

Crevice Corrosion Repassivation Potentials for Mill-Annealed and Thermally Aged Alloy 22

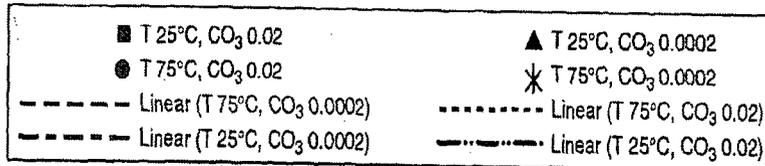

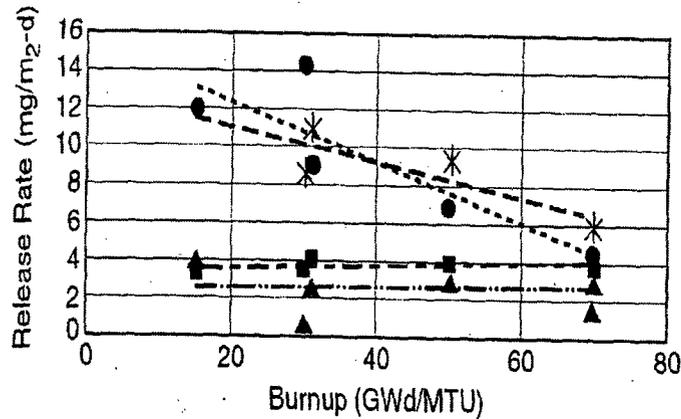

U.S. NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

Q 10: Dissolution Rates for High Burnup Fuel

- Available information indicates that high burnup SNF does not increase the dissolution rate.

Spent Nuclear Fuel Dissolution Rate As a Function of Burnup Under Different Temperatures (T) and Molar Total Carbonate Concentrations (CO₂).

(Jain, et al., 2004)

- Available information indicates that:

- prior dry oxidation of high burnup SNF may increase surface area, to increase dissolution rates (Ahn, 1996).

- hydride formation (Pan, et al, 2007; Ahn, et al., 2007) does not affect dissolution rate, except potentially altering surface area.

75 °C (167 °F); 25 °C (77 °F);
 mg m⁻² d⁻¹ = 1.42x10⁻⁹ lb in⁻² d⁻¹

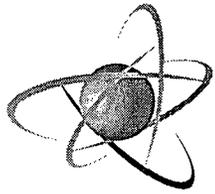

Q 11: Use of SIMFUEL Data

- Dissolution rates of SNF, unirradiated UO_2 , and SIMFUEL are undistinguishable for similar environmental conditions. Thus, dissolution experiments using unirradiated UO_2 or SIMFUEL are considered appropriate (Ahn and Mohanty, 2007; Jegou, et al., 2001; Shoesmith, 2000; Serrano, et al., 1998).
- Radiolysis effects on SNF dissolution may be significant in reducing environments. The potential Yucca Mountain repository is oxidative, not reducing, with abundant buffered oxygen available. Therefore, radiolysis is anticipated to have a negligible effect on an oxidized system.
- Uncertainties regarding the geometry of alpha particle emission after potential container failure appear low but are being considered (Ahn and Mohanty, 2007; Jain, et al., 2004).

Q 12: Long-Term Spent Nuclear Fuel Behavior

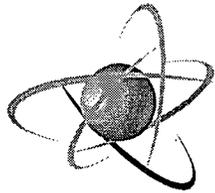

- **Long-term stability of irradiated UO_2 matrix** – Other than chemical degradation (e.g. dissolution), ongoing work in Europe indicates long-term stability of crystal structure/integrity and stable radionuclide distributions.
- **Physical degradation** – Physical degradation could come from alpha displacement damage or mechanical failure, sometimes assisted by chemical process such as hydration in the irradiated UO_2 or hydrogen embrittlement in cladding.
- **Stability of cladding** – Cladding could be subject to gross rupture or perforations (e.g., pin holes and hairline cracks) by applied stress, hydrogen embrittlement, or corrosion through time.
- **Hydriding** – Hydrogen embrittlement in cladding comes from the formation of a brittle zirconium-hydrogen compound (i.e. hydride). Existing hydrides after reactor discharge could be reoriented radially under applied stress. More radial hydrides could form by absorption of hydrogen during corrosion, which could reduce cladding ductility or cause slow crack propagation.

U.S. NRC
UNITED STATES NUCLEAR REGULATORY COMMISSION
Protecting People and the Environment

Q 13: Risk Insights Radionuclide Release

- Fundamental risk insights (NRC, 2004) have not substantially changed in light of new information.
- Radionuclide release depends in part on extent of the surface-area opening on WP.
 - Small surface-area opening for groundwater entry into the failed WP.
 - Limited groundwater volume restricts the mobilization of radionuclides.
- The expected extent of surface-area opening for various corrosion modes includes:
 - General corrosion - loss of passivity gives relatively large opening; may lead to advective release
 - Crevice corrosion – restricted opening from susceptible water chemistry, tight crevice area of buckled DS and WP, and weld area; may lead to diffusional or advective release
 - Unlikely SCC – restricted area opening; may lead to diffusional release
- New internals of WP to reduce colloid production

Disclaimer

This presentation describes work performed by the Center for Nuclear Waste Regulatory Analyses (CNWRA) for the NRC under contract number NRC-02-02-012. The activities reported here were performed on behalf of the NRC office of Nuclear Material Safety and Safeguards, Division of High Level Waste Repository Safety. This presentation is an independent product of the CNWRA and does not necessarily reflect the view or regulatory position of the NRC. The NRC staff views expressed herein are preliminary and do not constitute a final judgment or determination of the matters addressed or of the acceptability of a license application for a geological repository at Yucca Mountain.
