RE: Palo Verde Nuclear Power Plant

CONFIDENTIAL MEMORANDIUM

Dear Senator John Mc Cain,

We can learn certain things from the recent "outage" at Palo Verde...

- 1) "Power lines" in and around the area near a Nuclear Power plant are vulnerable to "Tripping". (See article: "A-Plant unit down after outage will resume operation Monday", by Lindsey Collum, the Arizona Republic Newspaper 8-3-2003).

This situation may represent a "systemic flaw" in the security or design of Nuclear Power plants nationwide. One, which could be exploited by terrorists seeking to recreate or cause an "outage" situation similar to that which happened to Palo Verde.

Sincerely

Robert Tilford

RE: Palo Verde Nuclear Power Generating Station "shut down"!

Dear Senator Mc Cain,

Salt River Project workers "Tripped power lines" causing Palo Verde Nuclear Power Generating Station to "shut down"! Meanwhile... Unit 3 remains out of commission until repairs are completed on a broken seal on a Nuclear reactor cooling pump - the cooling pump controls both the temperature in the core, and maintains the flow of water in the reactor itself.

According to Arizona Public Service spokesman "a leak could have developed if power had been restored before workers noticed the ruptured seal" in the Nuclear reactor.

The "cooling pump" apparatus is located within a containment area for radioactive material, which could have been released, compromising the safety of both the plant workers and the public.

Palo Verde is expected to resume operation on Monday, August 4, 2003 (see attached article: "A-Plant unit down after outage will resume operation Monday", by Lindsey Collom, the Arizona Republic Newspaper, 8-03-2003).

Sincerely

Robert Tilford

A-plant unit down after outage will resume operation Monday

By Lindsey Collom
The Arizona Republic

A 1,270-megawatt generator at the Palo Verde Nuclear Generating Station may be back in operation Monday after being shut down for nearly a week due to a broken seal on a reactor cooling pump.

The broken seal was discovered last week after Salt River Project workers tripped power lines in the area, causing the plant to shut down.

Unit 3 remains out of service until repairs are complete.

Palo Verde spokesman

Jim McDonald said the pump, which maintains the flow of water in the reactor, did not leak.

He said a leak could have developed if power had been restored before workers noticed the ruptured seal.

"It is unusual to have to re-seal the reactor cooler pumps," McDonald said.

The pumps are located within a containment area. No radioactive material has been released, nor has the safety of the public or plant workers been compromised, the spokesman said.

Other APS plants around the state and in the Four Corners area are being used to

replace the power lost from Unit 3.

Plant officials have also purchased additional power to allay service interruptions.

"Palo Verde is a plant you like to have available at all times," he said. "(The closure is) not without some cost to us."

McDonald said the plant didn't inform the public or news media of the shutdown earlier last week because it is "not a safety issue. It's not even a power supply issue."
